Jaina ethics evolved out of the rules for the ascetic, which served as the model, with necessary changes, for the laity as well. The basic ascetic rules are encapsulated in the so-called five great vows (*mahāvratas*) ascribed to Mahāvīra, which seem to be a summary of Indian asceticism as a whole from ancient times. The first and foremost of these is nonviolence, which entails total abstinence in thought, word and deed from injury to all life forms. The principle of life is the souls which inhabit atoms, so Jainism emphasizes extreme care with reference not only to plant and animal life forms but also to those in earth, water, fire and air. The vow of nonviolence is extended to include not making another perform acts of violence and not approving them in any way. Further, ascetics, who are usually wandering mendicants, are required to stay in one area during the monsoon to avoid unintentionally disturbing and harming life forms in and as a result of the abundance of water. To avoid inadvertently injuring insects, certain groups of ascetics even cover their mouths and noses, and carry a whisk to keep insects away. The vow of not eating after sunset for the same reason is an ascetic rule and one which is considered to be ethically meritorious when practised by householders.

The other vows are: to abstain from lying, and to take care not to use violent or harmful speech; not to take what is not given; to lead a life of celibacy; and to renounce attachment to the objects of the world, that is, to renounce possession of property.

Jainism's extreme emphasis on nonviolence is grounded in its metaphysics. Violence is responsible for the maximum amount of karma that can be accumulated by the soul, and since liberation is possible only when karma is completely destroyed, the task is reduced through an avoidance of violent deeds. Physical activity *per se* is responsible for the accumulation of karma; abstinence from it is symbolized by the famous iconic representations of ascetics standing upright over such long periods that vines grow up their legs - physical control represents the mental control that is also necessary to avoid subtle, inner movement. With the axiom 'nonviolence is the highest religion', Jainism summarizes the basis of its ethics and religious life.

The ascetic vows are mirrored in the rules for what the laity should do to exemplify an ethical life. The vow of chastity is relaxed for householders, with sexual contact restricted to the married partner; bearing in mind the ascetic's great vow of chastity, however, restraint is enjoined as a virtue. Other vows which are included in the religious life of devotees include: nonattachment to property and possessions, and the aim of leading a simple life; religious giving or donation; eschewing excessive and unnecessary travel; fasting on auspicious days of the Jaina calendar.

The mutual reliance of ascetics and laity is evident throughout the history of Jainism. The ascetics do not cook, and rely on the devotees for their daily subsistence, and the laity require the ascetics for their religious teaching and advice. Confession of ethical transgressions belongs to the religious life of both ascetics and laity, who atone for them by penances of religious purification, the aim being to reduce or even completely annihilate the karmic effect of the infringement.

Jainism, together with Buddhism, shows how a religious and virtuous life is possible without the idea of a creator god to whom one can turn, one who is ultimately made responsible for the human condition. Models for ethical life in Jainism are provided by the biographies of the twenty-four Jinas, the conquerors of the passions, of whom Mahāvīra was the last. Indeed, they are worshipped as divine beings, even though the tradition represents them as human beings who through their extreme asceticism gained an insight into the nature of reality, on account of which they are regarded as omniscient. Their lives serve as a guiding principle and, according to the tradition, an emulation of their virtues can lead one to the same goal of liberation that they achieved.

Under the rubric of ethics the issue of voluntary death may be mentioned. Inscriptional evidence records its occurrence throughout the history of Jainism and even in contemporary times, though it has been rare since about the twelfth century. This kind of death, open to both ascetics and laity, is a death that literally makes 'the physical body and the internal passions emaciated' (*sallekhanā*; Pūjyapāda on *Tattvārthasūtra* V, 22); often it serves to accelerate the death process already in progress. Jainism contrasts this with death that occurs through suicide,

which the Jainas eschew because passions such as 'attachment, aversion or infatuation' are involved in suicidal death. By virtue of its excellence, the passionless death (which is performed under strict conditions), is regarded as the most effective ascetic practice to rid the soul of binding passions and to terminate an ethical life.

4 Kundakunda, Umāsvāti and Siddhasena Divākara

These three thinkers are the pioneers of Jaina philosophy whose basic ideas set the trend for most later thinkers. Biographical details of all of them are mixed with legend and there are differences of opinion as to whether they really wrote all the works ascribed to them; there is also a lack of consensus about their dates.

Kundakunda. If recent research is correct in considering him to have belonged to the second or third century AD, then this would make him the first significant and independent thinker of the post-canonical period whose views are accepted as representing the essence of Jaina thought. Although he was a pioneering Digambara thinker, probably from South India, appreciation for his views also comes from the Śvetāmbara sect of Jainism. He was also known as Padmanandi. The name Gṛdhrapiccha, erroneously used for him since about the fourteenth century, has led to confusion because it is also an alias for Umāsvāti.

A total of eighty-four works on various themes are ascribed to Kundakunda, of which fifteen are extant and three may be said to be philosophical masterpieces, all written in the Prakrit language. These are the *Pañcāstikāyasāra (Essence of the Five Existents)*, the *Pravacanasāra (Essence of the Scripture)* and the *Samayasāra (Essence of the Doctrine)*. The *Pañcāstikāyasāra* is an elementary work dealing with the Jaina substances (excluding time because it does not occupy any spatial points) and the fundamental truths, to which two additional categories are added, namely the meritorious and demeritorious acts related to karma (*puṇya* and *pāpa*). The *Samayasāra* emphasizes, among other things, two standpoints mentioned in the canonical literature which seem to have no relation to the standard sevenfold standpoint (see Manifoldness, Jaina Theory of). These are the 'definitive' standpoint (*niścayanaya*), used synonymously with the 'pure' or 'transcendental' (*śuddha* or *paramārtha*) standpoint, and the 'mundane' standpoint (*vyavahārikanaya*). It is an illuminating work dealing with the nature of the soul and its contamination by matter, and whether the soul's intrinsic nature is in any way affected or changed through karma bondage in so far as it is the doer and enjoyer of activities. An attempt is made to reconcile these problems, solutions to which depend on the standpoint from which one approaches the issues. The *Pravacanasāra* is an insightful work whose three sections clearly delineate its scope: knowledge, the objects of knowledge, and conduct. The problem of substance, quality and mode, is one of the pivotal issues in Jaina philosophy and a few points are outlined below in order to show how Kundakunda deals with it. It forms the subject matter of the second section of the *Pravacanasāra*, which the tenth-century commentator Amṛtacandra says Kundakunda 'properly discusses'.

The problem is basically that of how change in the world may be explained given the permanent, eternal nature of the two basic substances of ultimate reality; this has obvious implications for the essential nature of the soul. Kundakunda begins the section with the statement: 'The object of knowledge is made up of substances, which are said to be characterized by qualities, and with which, moreover, are (associated) the modifications' (*Pravacanasāra* II, 1; trans. A.N. Upadhye). The basic problem is then evident when he says: 'There can be no origination without destruction, nor is there destruction without origination; origination and destruction are not possible in the absence of permanent substantiality' (II, 8). How 'origination' and 'destruction', which in fact refer to change, are to be understood is expressed by Kundakunda in typical Jaina language in II, 19: 'The substance forever retains its position, its own nature, as endowed with positive and negative conditions according as it is looked at from the substantial and the modificational viewpoints.' This is further elaborated:

> All substances are nondifferent from the substantial viewpoint, but again they are different from the modificational view-point, because of the individual modification pervading it for the time being. According to some modification or the other it is stated that a substance exists, does not exist, is indescribable, is both or otherwise.
>
> (II, 22-3)

What Kundakunda means by origination and destruction is distinctively Jainist and is clarified later in the same section: 'In this world, in which modifications originate and pass away at every moment, nothing is absolutely produced or destroyed; what is the production of one modification is the destruction of another; and thus

origination and destruction are different' (II, 27). The change that occurs in matter is understandable on the analogy of objects and colour. Just as gold (regarded here as a substance), for example, can have not only different shades of colour (with colour being its basic quality) but also different forms (with the object made out of gold being its modification), so too all substances retain their substantiality despite the apparent destruction of their qualities and modes. The situation is more complicated with the soul substance. The problem is technical, and relates to two 'operations' (*upayogas*) ascribed to the soul, namely 'indeterminate intuition' and 'determinate knowledge'; these operations are described as two qualities (*guṇas*) of the soul. The concern is with the unity or identity of the soul and involves the question of whether the two *upayogas* operate in the soul simultaneously or in succession, and if in succession, which is first, and whether they maintain their distinctness in the state of omniscience. Kundakunda maintains that they operate successively at the mundane level and simultaneously at the transcendental level of omniscience. His view, which is also held by Umāsvāti, represents the attitude of the Digambara sect and is opposed, for example, by Siddhasena Divākara, who, in regarding quality and mode as synonyms, says that they are not separate operations in the state of omniscience. His view represents the general Śvetāmbara standpoint, based on the fact that the canonical literature distinguishes only substance and quality, without mentioning the standpoint connected with the modifications of a substance.

Umāsvāti. He is famous for the first Jaina work written in Sanskrit, called the *Tattvārthasūtra* or *Tattvārthādhigamasūtra (Mnemonics on the Meaning of the Fundamental Principles)*. Again, biographical details are scanty and both the sects of Jainism claim him as one of their own (with the Digambaras also calling him Umāsvāmī) and regard his work, in traditional Indian manner, as authoritive for Jaina thought. His dates vary from the second to the fifth centuries AD, with recent preference for the fourth or fifth centuries. Of the five works ascribed to him, the *Praśamaratiprakaraṇa (Treatise on the Love for Tranquility)* - a popular work dealing with ethical issues and addressed to ascetics and householders - and the *Tattvārthasūtra* are philosophically important. There is an ongoing debate about whether, as the Śvetāmbaras believe, a commentary on the *Tattvārthasūtra* was written by Umāsvāti himself, or whether, as the Digambaras believe, the first commentary on it is Pūjyapūda's fifth-century *Sarvārthasiddhi (Attainment of the Meaning of Everything)*. There are two versions of the work by the two sects, with hardly any philosophically significant differences.

The *Tattvārthasūtra* contains a series of aphorisms, divided into ten chapters, which are understandable only with a commentary. The value of the work is evident from the fact that throughout the history of Jaina philosophy, every major thinker has written a commentary on it. Until around the tenth century, the Digambara thinkers, such as Akalaōka (*c.* eighth century) and Vidyānandin (*c.* ninth century), took centre stage. They wrote in a difficult style and hardly any research related exclusively to their writings has been done.

Commentators often took the opportunity to criticize other views and defend the Jaina standpoint. For example, in his commentary on Umāsvāti's aphorism on the means of knowledge and the standpoints (*Tattvārthasūtra* I, 6), Vidyānandin enters into an interestingly detailed debate with the Buddhists (even quoting from Dharmakīrti's seventh-century work on the means of knowledge, *Pramāṇavārttika*) regarding the knowledge of an object, namely, whether an object is cognized as a whole or in parts. The issue is raised in the context of the Buddhist view that an object as a whole does not exist, against which it is asserted that a part of an object, which can be understood to be a whole in itself, cannot then be cognized, putting the Buddhist standpoint in jeopardy. Vidyānandin, applying the Jaina theory of standpoints, says that both a part of an object and the object as a whole are cognized from different standpoints.

Umāsvāti's contribution lies in presenting the basic issues in Jaina philosophy in a systematic form, so much so that his work usually forms the standard for Jaina thought as a whole. The ontology, metaphysics and epistemology summarized in §§1-2 are based on his *Tattvārthasūtra*.

Siddhasena Divākara. It seems certain that Siddhasena lived in the fifth century AD and that he wrote in Sanskrit and Prakrit. He is generally considered to have belonged to the Śvetāmbara sect, although he is claimed by both the sects of Jainism as one of their own, serving as the first Jaina logician for both. Apart from the canonical literature, there seems to be little influence from other sources in his writings, despite similarities of ideas between him and, for example, Kundakunda. Reference to Siddhasena's work on logic, the *Nyāyāvatāra*, has been made in §2. His second most important work on philosophy, written in Prakrit, is the *Sammaisutta (Mnemonics on Proper Understanding*; Sanskrit, *Sanmatisūtra*), dealing with the seven Jaina standpoints, knowledge and the objects of

knowledge. It is in the last section that he clearly discusses the issue of the standpoints, taking into consideration the quality of a substance, which according to him is not sanctioned by Jaina scripture as a separate category.

Siddhasena is also credited with having written twenty-one short compositions, each consisting of thirty-two verses (and simply called the ‘thirty-twos’), on a variety of themes, including eulogies to Mahāvīra, critiques of Buddhist and Hindu schools, and an exposition of Jaina concepts. The work on logic is also written in this form.

5 Other notable philosophers

A host of philosophers, some already referred to, have followed Kundakunda, Umāsvati and Siddhasena. Suffice it to make a few remarks on the contribution of five further thinkers, to cover the period until the seventeenth century. Haribhadra, perhaps of the eighth century, belongs to the Śvetāmbara sect and is praised as a great teacher of Jainism. Apart from works on classical yoga as a system of meditational practice, which he applies in the Jaina context, he is famous for his compendium of six systems, the *Ṣaḍdarśanasamuccaya*, in which he includes Jaina philosophy together with Buddhism and four Hindu systems. He evinces a trait common among Jaina thinkers and evident already in Akalaōka, namely an excellent acquaintance with other systems of Indian thought so as to enter into authentic debate with them. Some scholars (notably Halbfass 1981) have seen a connection between this and the emergence of the theory of manifoldness which became the hallmark of Jainism.

There is a relative consensus about the dates of the polyhistor Hemacandra (1089-1172), whose contribution lies especially in systematizing and upholding the Śvetāmbara tradition of Jainism. Although his influence is stronger in the field of Jaina literature, insightful attacks on other philosophical views are also evident, for example, in his *Anyayogavyavacchedikā(Critique of Other Schools)*. His treatise on yoga (*Yogaśāstra*), dealing with Jaina ethics, is still an exemplary work.

Abhayadeva, active in the eleventh century, needs to be mentioned for his commentaries on the Jaina canonical works. The value of the commentary literature in India lies not only in the explication and clarification of basic texts, but also in the fact that commentators often present views which they might not otherwise have found occasion to express. In his commentary on the *Sthānāōgasūtra*, for example, a canonical text which is a compendium of Jaina doctrine, ethics and cosmology, Abhayadeva takes the opportunity to discuss epistemological issues.

Vādidevasūri (twelfth century) is not only famous as a Śvetāmbara thinker who defeated in a public debate the Digambara thinker Kumudacandra, but for his excellent *Syādvādaratnākara (The Ocean of Manifoldness)*. This is a commentary on his own work on knowledge and standpoints, inspired by the work of the ninth-century Digambara thinker Māṇikyanandin.

Yaśovijaya (1624-88) is perhaps the last intellectual giant of Jainism, praised not only for his acumen as a logician, but also for his vast knowledge of Jainism and other traditions. This erudite Śvetāmbara scholar is credited with up to a hundred works, including an attack on the great logician of Navya-Nyāya, Raghunātha Śiromaṇi (early sixteenth century), and a commentary on a work by Vidyānandin.

Jaina philosophy never really took the centre of the philosophical stage in India, but that does not reduce its significance. Royal patronage from Mahāvīra’s time till about the sixteenth century, especially in Gujarat and Karnataka, and the architectural masterpieces of its temples bear witness to the social impact it has had throughout its history. Jaina monasteries were and are centres of learning, and research undertaken since the early 1980s is gradually reaping the benefit of the Jaina virtue of collecting and copying manuscripts of all disciplines for the sake of acquiring religious merit. It is thanks to this that a Jaina scholar, Sukhlalji Sanghvi, was able to publish in 1940 an original eighth-century work on Indian materialism by one Jayarāśi, based on the only extant manuscript. Further, the European Indologist Erich Frauwallner, in a posthumously published work (Frauwallner 1984), convincingly proves the original atheistic beginnings of the Vaiśeṣika system on the basis of the information about it from Haribhadra. The Jaina libraries contain a wealth of information relevant not only to philosophy but also to various aspects of Indian studies which have yet to be researched. Unfortunately, studies in Jainism suffer from a lack of published texts, though an earnest attempt has been made in the West and by the various Jaina institutions in India to make available critical editions, translations and studies. Clearly this has important implications for the study of the history of Indian philosophy.

James of Viterbo (*c.*1255-1308)

James of Viterbo's writings reveal a loyalty to Augustine combined with an interest in Neoplatonic sources such as Proclus, Pseudo-Dionysius and Boethius. He also reveals a strong interest in the Greek commentators on Aristotle, in Simplicius as regards predication and language and in Themistius and John Philoponus as regards the nature of the intellect and intellectual cognition. Frequently, after presenting various positions on a topic and noting how they differ, he proposes to state what seems probable to him. He thus proposes, for example, a theory of innatism. In contrast, he shows no little certitude in his De regimine christiano (On Christian Rule), where he presents a markedly papalist political theory.

James entered the Order of the Hermits of Saint Augustine around 1272, and studied at Paris from 1275 to 1282 and again after 1285. He later succeeded to the chair of his teacher, Giles of Rome, which he held until 1300. He then taught at the Augustinian *studium generale* in Naples until 1302. He ended his career involved in active ministry as the Archbishop of Naples.

The major source for our knowledge of James' philosophical views is his *Disputationes de quolibet (Quodlibetal Disputations)*, written some time between 1293 and 1297 at Paris. James accepts Augustine's concept of seminal reasons present in matter. He takes them to be the beginning (*inchoatio*) of or aptitude (*aptitudo*) for the form that will actually exist when something is generated. Nonetheless, James emphasizes that the human soul, unlike other forms, comes to exist through its direct creation by God. He does not consider Aristotle's position on the origin of soul, that is, whether or not it comes from outside the fetus, to be evident (see Soul, Nature and Immortality of the).

When James analyzes the nature of the agent intellect, he adopts a theory of innate knowledge that resembles his theory of seminal reasons. He sets forth the positions presented by Philoponus and Themistius, as well as views taken from Augustine, Boethius and his own contemporaries. Although James accuses ancient and recent interpreters of Aristotle of attempting to shape his words to suit their own positions, he then does the same. He proposes that when God creates the soul he endows the human intellect, which is itself a general aptitude, with special aptitudes or fitnesses (*idoneitates*) that are only incomplete actualities. These are the potential contents of the cognitive acts of our intellect. Sense experience simply excites the human intellect, which then moves itself to actual knowledge. James sets forth a similar theory regarding special aptitudes in the human will, which is itself a general aptitude, in order to explain individual acts of volition and to maintain that the will, too, is fundamentally active in nature and not passive to anything external.

Some of James' metaphysical views merit attention. In his early *Quaestiones de divinis praedicamentis (Questions on Divine Categories)*, he discusses problems concerning language and predication regarding the Trinity, referring constantly to Simplicius' commentary on Aristotle's *Categories* (see Simplicius). James opts for his own version of analogical language. In his *Disputationes de quolibet*, after analyzing the differing views of Giles of Rome, Henry of Ghent and Godfrey of Fontaines on essence and existence, he proposes to put forth what appears probable to him. Basically, essence and existence are related as the abstract to the concrete. Although they are identical as regards the principal thing that they signify, namely the essence, they differ by a real composition, since existence signifies secondarily and concretely all the things that are joined to the essence and that essence needs in order to exist (see Existence). In like fashion, James pursues a question which also much interested Henry and Godfrey as well as John Duns Scotus, namely whether all beings comprise an essential order which must come to a stop (*status*). James appears to favor the view that the series stops with a highest creature.

James occasionally alludes to a widely adopted scheme of metaphysical hierarchy. Many of his contemporaries held that both God and matter (or non-being) serve as measures of all the grades within the order of things according as things approach to or recede from them. James appears to concentrate almost exclusively on God as the measure. None the less, the concept of metaphysical hierarchy enables him to account for the destiny of human beings. In order to communicate and represent divine goodness, God established different grades among created things. The human being is the one creature that is composed of both the spiritual and the bodily and that thereby serves, as it were, as the medium and bond (*medium et vinculum*) of both. The human soul perfects the body rather than being perfected by the body. Indeed, the end of the soul is not the perfection of the body but union with

something better than either the body or the soul, namely God.

James, William (1842-1910)

The American William James was motivated to philosophize by a desire to provide a philosophical ground for moral action. Moral effort presupposes that one has free will, that the world is not already the best of all possible worlds, and, for maximum effort, according to James, the belief that there is a God who is also on the side of good.

In his famous, often misunderstood paper 'The Will to Believe', *James defended one's right to believe in advance of the evidence when one's belief has momentous consequences for one's conduct and success, and a decision cannot be postponed. One such belief is the belief in objective values. Generally, a belief is objective if it meets a standard independent of the believer's own thought. In morals, objective values emerge from each person's subjective valuings, whatever their psychological source, when these valuings become the values of a community of persons who care for one another. Still, even in such a community there will be conflicting claims, and the obligations generated by these claims will need to be ranked and conflicts resolved. James' solution is to say that the more inclusive claim - the claim that can be satisfied with the lesser cost of unsatisfied claims - is to be ranked higher. This is not to be mistaken for utilitarianism: James is not a hedonist, and it is not clear what he means by the most inclusive claim.*

A concern for others makes sense only if there are others who inhabit with us a common world. Pragmatism, which he co-founded with C.S. Peirce, and radical empiricism provide James' answer to those who would be sceptics concerning the existence of the common-sense world. Pragmatism is both a theory of meaning and a theory of truth. As a theory of meaning it aims at clarity; our thoughts of an object are clear when we know what effects it will have and what reactions we are to prepare. As a theory of truth, pragmatism makes clear what is meant by 'agreement' in the common formula that a belief is true if it agrees with reality. Only in the simplest cases can we verify a belief directly - for example, we can verify that the soup is too salty by tasting it - and a belief is indirectly verified if one acts on it and that action does not lead to unanticipated consequences. Contrary to a widespread misunderstanding, this does not mean that James defines truth as that which is useful; rather, he points out that it is, in fact, useful to believe what is true.

James rejects the dualism of common sense and of many philosophers, but he is neither a materialist nor an idealist, rather what he calls a 'pure experience' (for example, your seeing this page) can be taken as an event in your (mental) history or as an event in the page's (physical) history. But there is no 'substance' called 'pure experience': there are only many different pure experiences. You and I can experience the same page, because an event in your mental history and an event in mine can be taken to be events in the same physical history of the page; James may even have been tempted to say that a pure experience can be taken to belong to more than one mental history.

According to James, pragmatism mediates the so-called conflict between science and religion. James took religious experiences very seriously both from a psychologist's perspective and as evidence for the reality of the divine.

1 Life

William James, brother of the novelist Henry James, Jr, was the oldest child of Henry James, Sr, a man of independent means, who in early manhood experienced a major psychological crisis. Under the influence of the writings of the eighteenth-century Swedish mystic Emanuel Swedenborg, Henry Sr came to see redemption in self-surrender, allowing an in-flowing of divine love that led to a concern with social justice, an interest in Fourierist socialism, and a large number of writings and public lectures. William experienced a similar crisis in 1870, but for him the return to normality was stimulated by reading the French philosopher Charles Renouvier; it consisted not in self-surrender but in affirming his belief in free will and in the resolve to acquire intellectual habits that would lead to daring acts of thought. However, James shared his father's concern for social justice. The effects of this experience are to be seen in many of James' writings, from the long discussion of the will and the emphasis on habit in *The Principles of Psychology* (1890), and the often misunderstood essay 'The Will to Believe', to his widely read *The Varieties of Religious Experience* (1902) and *A Pluralistic Universe* (1909).

After an unorthodox but rich education at home and in Europe, William found it difficult to decide on a career. Eventually he earned an MD, but never practised. In 1873 he taught a course in physiology at Harvard, where he was to continue to teach until his retirement in 1907. In 1875, James set up the first psychological laboratory in America and taught his first seminar in psychology; in 1878 he married and, in the same year, published his first articles in philosophy. James taught both psychology and philosophy, advancing to a full professorship, and in 1890 published the monumental, justly renowned two-volume *Principles of Psychology*; in abridged form, it became a widely used text.

From 1879 on James presented single lectures before a variety of audiences, some of which were published in 1897 in *The Will to Believe, and Other Essays in Popular Philosophy*. In its preface, James announces that he regards all claims concerning matters of fact as hypotheses subject to revision in the light of subsequent experience, and extends this empirical attitude to metaphysical hypotheses. *Talks to Teachers on Psychology and to Students on Some of Life's Ideals* appeared two years later. He concludes the preface to that volume, after condemning American imperialism, 'Religiously and philosophically, our ancient national doctrine of live and let live may prove to have a far deeper meaning than our people now seem to imagine it to possess'.

James retired in January 1907 having just given the Lowell lectures. These were published under the title *Pragmatism: A New Name for Some Old Ways of Thinking* and brought together virtually all of James' philosophical concerns. While the term 'pragmatism' was first introduced by James' friend C.S. Peirce in 1878 and reintroduced by James in a lecture given at Berkeley in 1898, after which it became widely used, it is fair to say that in *Pragmatism* this philosophy receives its full elaboration, at any rate as it is understood and embraced by James (see §5 below). The central idea is James' account of truth; its acceptance, James thought, would bring about a revolution in epistemology. Instead it met with misunderstanding and opposition to which James responded in 1909 in *The Meaning of Truth: A Sequel to 'Pragmatism'*, a collection of articles, the first of which was written as early as 1884 but several of which were composed specifically for that volume.

William James died on the 26 August 1910. There were several posthumous publications, in particular *Essays in Radical Empiricism* (1912) which contains James' most technical philosophy (see §7). While James claims in the preface to *Pragmatism* that the doctrine of radical empiricism is logically independent of that of pragmatism, John J. McDermott is surely correct when he claims that one will misunderstand James' views in the works published in his lifetime unless one takes his radical empiricism into account (introduction to *Essays in Radical Empiricism*).

2 Psychology

Although he taught both subjects, James is one of those to be credited with the separation of psychology from philosophy. In the preface to *The Principles of Psychology* (1890), James attempts to distinguish sharply between metaphysics and psychology. 'I have kept to the point of view of natural science throughout the book. Every natural science accepts certain data uncritically…. Psychology, the science of finite individual minds, assumes as its data (1) *thoughts and feelings*, and (2) *a physical world* in time and space with which they coexist and which (3) *they know*. Of course, these data are themselves discussible; but the discussion of them (as of other elements) is called metaphysics and falls outside the province of this book' (1890: v-vi). Yet James cannot avoid metaphysics entirely and admits as much. Psychology, he holds, accepts the mind-body dualism of common sense but rejects the metaphysical dogma that there can be no mind-body interaction. For if mind and body are radically different, the biological evolution of mind can be explained only on the hypothesis that there have been 'mental atoms' as well as physical ones at the origin of the universe, and that the former must be able to form complex aggregates just as physical atoms do. But in *The Principles of Psychology*, James denies precisely this: 'We cannot mix feelings as such, though we may mix the objects we feel, and from *their* mixture get new feelings' (1890: 157). Moreover, feelings, sensations and thoughts cannot combine themselves; they form new wholes only from the perspective of an outside observer. Confusing one's own standpoint with that of the mental fact observed is, for James, the 'Psychologist's Fallacy' (1890: 196). Of course, James does not deny the existence of 'higher' states of mind, say, understanding a five-word sentence, but what he asserts is that understanding the sentence is a mental fact other than, and in addition to, the five facts of understanding each word separately. But on this James was to change his mind. In his presidential address to the American Psychological Association in December 1894, 'The Knowing of Things Together', he concludes that mental contents can be complex, that we can speak of the parts of a field of consciousness, though such parts are not separable. In the same lecture he also rejects the dualism that

had been a working assumption of *The Principles of Psychology* (see §6). Always, however, the mind is not a mere knower: we know in order to act.

Two chapters of *The Principles of Psychology* are of particular philosophical interest, namely, ‘The Stream of Thought’ (later called ‘stream of consciousness’) and ‘The Consciousness of Self’. In the former, James offers five facts. (1) Every thought (taking thought to include feelings and sensations) appears to belong to some self. (2) No state of mind can recur in exactly the same way. Although we may experience the same object again, the sensation will be different the second time, for the condition of the brain will have been modified by the earlier sensation. (3) Introspection shows that consciousness does not jump from one discrete content to the next, but changes in a continuous manner. Even after interruptions, such as in sleep, we are aware of being the same person, and no sudden change in sensation comes as a total break; it is only a more rapid change. Another element in the continuity of consciousness is what James called ‘fringe’. The fringe is what leads one’s mind from thought to thought, rejecting this one and accepting another until one reaches a conclusion. Later James identified the ‘fringe’ with the subconscious, and that was to play an important role in his explanation of religious experience (see §4). (4) We take it that our thoughts refer to independently existing objects because many thoughts (both of one person and of different persons) appear to have the same object. (5) We pay selective attention to some parts of the field of consciousness, and over the millennia we and our ancestors have in this manner ‘extracted’ the everyday world out of ‘the primordial chaos of sensations’ 1890: 277) (see §5).

While we agree to a remarkable degree in what we find interesting, our own selves are for each of us of unique importance. James distinguishes several senses of self. The material self consists of one’s body and at least some of one’s material possessions. The social self, or rather the social selves, are the various personalities one presents to various others; these, to a large extent, dictate one’s behaviour. One’s spiritual self is not the whole of one’s inner life but that portion of which we say that it *has* the thoughts, feelings, etc. that make up our stream of consciousness. Although James calls this self ‘spiritual’, he does not identify it with a continuous soul substance. Introspection reveals only a stream of thoughts, of which the present one is the judgment that I am the same self I was yesterday, a judgment based on resemblance of present bodily feelings to past ones and on the continuity of this thought with its predecessors. The present thought appropriates (selectively!) past thoughts of the stream; it is the ‘thinker’. It is pointless to appeal to a Kantian pure ego or a Cartesian soul, for no one has explained how such an entity would hold the stream of thought together (see Kant, I. §6; Descartes, R.).

3 Moral philosophy

James’ writings in moral philosophy, though sparse, provide the best entrance into his thinking. These writings fall into two categories: those that address directly some relatively concrete problem and those of a more systematic nature. The former range from letters to newspapers protesting against America’s policy in the Philippines, to essays like ‘The Moral Equivalent of War’, suggesting a struggle against nature as a substitute for the senseless struggle of nations against nations, and ‘The Social Value of the College-Bred’, seeking to allay the ennui of young women who saw no use for the education they had acquired. ‘What Makes a Life Significant’ and ‘On a Certain Blindness of Human Beings’ are essays that speak to a precondition of the moral life - the ability to appreciate what another’s life is like, what makes it worth living or intolerable - and form a bridge to the ethical theory found in the essay ‘The Moral Philosopher and the Moral Life’ (1891) and in various passages in *The Principles of Psychology*.

Leading a moral life requires, according to James, a purpose that gives the life significance, will, courage and determination, a belief in objective values and a belief in free will; here I shall concentrate on the last two items. In ‘The Moral Philosopher and the Moral Life’, James distinguished three questions: (1) where do our moral ideas come from? (2) To what do they refer? (3) How do we weigh various goods and evils, various obligations against one another?

Our valuings have multiple psychological sources: some can be traced back to bodily pains and pleasures, others are the result of habituation or indoctrination, while still others are due to an inborn higher moral sensibility that varies somewhat from person to person. Examples of the last are the demand that like cases be treated alike and the abhorrence with which we respond to the thought of sacrificing an innocent child for the happiness of many. These subjective valuings become objective, that is, coercive, whenever there are creatures who care about one another or acknowledge the claims they make upon each other. Our sympathetic instincts are not only the source of our

higher moral sensibilities, but the basis of objectivity in ethics. Conflicts of claim are, however, unavoidable; how are they to be resolved?

Moral agents encounter conflicts of serious claims in moments of crisis. In *The Principles of Psychology*, James emphasizes the loneliness of such moments and also their momentous nature. What one chooses in such a moment is not so much what one is to do as what sort of person one is to become, and what guides one here is the inner voice of one's higher moral sensibilities. That voice, according to 'The Moral Philosopher and the Moral Life', will tell us to 'seek incessantly, with fear and trembling, so to vote and to act as to bring about the very largest total universe of good which we can see' (1897: 209). Analogously, moral philosophers are to fashion out of the values they find in the world the most inclusive coherent system. And to this task they are to bring no value of their own (this is how the philosopher differs from the ordinary moral agent) other than these 'logical' values of coherence and inclusiveness. But this, surely, is an impossible task. Since there is no common unit to which all goods can be reduced and yet all goods cannot be jointly realized, moral philosophers must appeal to their own moral sensibilities in weighing one ideal against another. The impossible task seemingly given to moral philosophers is perhaps an ironic description of what other philosophers have attempted, rather than a task for us, or James, to accomplish. Ethics, like physics, is for James an empirical science. It rests on claims actually made, and what the most inclusive realizable good will be depends both on that and on the nature of the universe; finally, since we are fallible, we must be prepared at all times to revise our judgments in response to complaints from those whose demands have gone unmet. When James demands that we pursue ideals that can be realized at least cost to other ideals, he does not simply say that in our own lives we must be prepared to sacrifice lesser goods for greater ones, nor that a minimal sympathy and a minimal sense of justice suggest that we are at times to sacrifice our own lesser goods to the greater goods of a larger community. He articulates here his commitment to democracy and liberalism, to tolerance of anything other than intolerance, and his struggle against that blindness in human beings mentioned above.

The moral life consists not only of moments of crisis; for the most part, guided by our aspirations that give it significance, it runs along in quite habitual ways. James provides a series of maxims on how to acquire and keep good habits, for good habits are what make up a moral character. There is nothing so repulsive, he thought, as a sentimental character who never acts forthrightly.

All the above assumes that we can and do choose among alternatives that make a real difference to the world. As a psychologist, James simply records that deliberation usually comes to an end when one has only one idea of one action before one's mind; action follows. But when one's moral impulses conflict with more habitual or instinctive ones, countervailing reasons and motives tend to be still before the mind; one has a sense of effort and we speak of moral victories. What has been said so far is compatible both with the hypothesis of free will and its denial. Indeed, neither logic nor empirical evidence can decide the question, and since for James it seem to have momentous consequences, he opts for free will, for a universe of alternative possible futures. James rejects both a facile optimism that believes nothing in the world needs fixing and a pessimistic resignation that believes nothing can be fixed. Indeed only in an open world are there objectively good and bad actions, and only someone believing in such a world will be able to lead the strenuous moral life. Additional moral energy, James holds, flows from the belief that the help of a God makes the victory of good over evil possible.

4 Religion

The question of the nature of God and of His existence occupied James' thought throughout his life. Although he was not a conventional Christian and quite anticlerical, he was a deeply religious person. In *The Varieties of Religious Experience*, he wrote with regret regarding mystical states, 'my own constitution shuts me out from their enjoyment almost entirely' (1902: 299). Yet twice in his life he suffered the sense of utter worthlessness and despair, indeed panic-fear, that often precedes a religious experience.

James took seriously the question whether, or to what extent, religious experiences provide evidence for the existence of the divine. In reply to positivistic scientists who claim a priori that religious experience is non-veridical and impugn it by pointing to its organic bases, he notes that all experience has an organic basis, and maintains that a religious experience's 'spiritual value' depends on its 'immediate luminousness', on how it fits into the rest of our beliefs and on its 'moral helpfulness' (1902: 33). All our conceptual systems are fashioned by us to deal with experience from the perspective of some interest or sets of interests; we have no reason to think that

only one of them agrees with reality. In particular, both science and religion (better: particular sciences as well as particular religious beliefs and practices) are ‘genuine keys to unlocking the treasure-house of the universe to him who can use either of them practically’, and the use of one does not exclude that of the other (1902: 110).

After a rich and detailed survey of religious personalities and religious experiences, James then turns to the questions of spiritual value and practical moral consequences.

> What I then propose to do is, briefly stated, to test saintliness by common sense, to use human standards to help us decide how far the religious life commends itself as an ideal kind of human activity. If it commends itself, then any theological beliefs that may inspire it, in so far forth will stand accredited. If not, then they will be discredited, and all without reference to anything but human working principles.
>
> (1902: 264)

James’ conclusion is well modulated. In a world in which not everyone is a saint, saintly turning of the other cheek will lead to the victory of evil. Yet both the faith of saints in a kingdom of heaven already here and the utopias of socialists and anarchists ‘help to break the edge of the general reign of hardness and are slow leavens of a better order’ (1902: 285).

There remains the question whether the religious person’s sense of a divine presence is objectively true. Because mystical experiences are intensely private and vary from person to person, and because the arguments of philosophers and theologians are unconvincing, James concludes that any attempt to demonstrate the existence of a deity is hopeless. Philosophy can distinguish, however, between a common religious core and the various ‘over-beliefs’ found both in institutionalized creeds and in the faith of individuals. The core is objectively true and consists in an awareness that one’s conscious self is part of a wider self. That wider self is understood as the source of one’s higher moral ideals and of one’s religious experiences, but may be merely one’s subconscious. However, James’ own over-beliefs include a belief in a God who is not only the source of our highest ideals but can produce real changes in us. He makes the victory of good over evil possible but (here James differs from most religious persons) not certain. This over-belief is a hypothesis and entails predictions - in a world with such a God, miracles will happen, and a different conduct is required than would be in a godless world; for, James speculates, it may well be that our efforts aid God in His tasks as He aids us in ours. Finally, James notes, religious experience requires neither that the deity be infinite nor that there be only one.

5 Pragmatism

James’ major contributions to philosophy are pragmatism and radical empiricism. Pragmatism for James consists in both a theory of meaning, which he ascribes rightly to C.S. Peirce, and a theory of truth, which he ascribes too generously to John Dewey and F.S.C. Schiller (see Truth, pragmatic theories of §2).

James gives in one paragraph two formulations of the Pragmatic Maxim: ‘… to develop a thought’s meaning, we need only determine what conduct it is fitted to produce: that conduct is for us its sole significance’. And, virtually quoting Peirce,

> To attain perfect clearness in our thoughts of an object, then, we need only consider what conceivable effects of a practical kind the object may involve - what sensations we are to expect from it, and what reactions we must prepare. Our conception of these effects, whether immediate or remote, is then for us the whole of our conception of the object, so far as that conception has positive significance at all.
>
> (1907: 26)

This maxim must not be confused with the verifiability criterion of meaning of the logical positivists (see Meaning and verification). Neither Peirce nor James used the maxim to reject metaphysics, although, as noted in §2, James used it to point out that the metaphysical hypothesis of a substantial soul merely reasserts, but fails to explain, one’s sense of being a continuous self. Again, unlike the logical positivists, James includes among sensations all kinds of feelings and emotional reactions; ‘experience’ would have been a less misleading choice of word. Thus, as mentioned in §4, religious hypotheses have meaning for James: believing them makes a difference to one’s moral energy, and some religious experiences are, for those who have them, overwhelmingly evidential. Finally, unlike the logical positivists, James, as discussed in §3, takes it that value judgments, in particular moral judgments, are true or false, not mere expressions of the speaker’s state of mind, nor mere attempts to sway an

audience (see Emotivism; Prescriptivism).

As a form of empiricism, pragmatism emphasizes the fallibility of all knowledge claims, but unlike other empiricisms it does not conceive of the mind as a passive receptacle. Rather, guided by our interests and the concepts we already have, we pay selective attention to our sensory inputs. Since human beings have, through evolution and through upbringing, to a very large extent identical interests, we have come to share a conceptual framework, the framework of common sense. Our common conceptual scheme makes our common lives possible, though we tend to notice our disagreements rather than the larger-scale agreements in which they are embedded. But we could not even disagree, nor would our disagreements matter, if we did not live in a common world, if any one person's beliefs and actions did not have practical consequences for others.

We move, with greater or lesser ease, between conceptual systems: in addition to those of common sense and of religion, there are multiple scientific frameworks. These ways of ordering experiences were developed in response to pressing interests and are modified or rejected if they fail to be useful. Seen in this light, scientific theories are not transcriptions of reality but rather 'instruments' that summarize old facts and lead us to new ones. They are true in so far as the new facts we are led to expect do in fact materialize, or, as James would prefer to say, they *become* true in so far as they become verified. Does he really mean that there are no unverified truths? According to James' student and biographer, Ralph Barton Perry, while he often defends the existence of an unexperienced reality, he fails to explain what this existence consists in ((Perry 1935: 591-2).

James points out that all our knowledge of the world is a product of the world and the human mind. Most of us take the basic concepts of common sense to correspond to reality, while physicists and some philosophers say this rather of the concepts of relativistic quantum physics. But these and any other conceptual frameworks are all equally human contributions to our knowledge. There is no reason to think that one of these will emerge as ultimately triumphant, nor that all of them will prevail as our knowledge grows. Some philosophers find this idea, the idea that the trail of the human serpent is over every knowledge claim, distressing, as if we 'made up' the world. But we only make up the concepts, and whether our beliefs using these concepts are true depends on the world.

Pragmatists accept the traditional view that truth is an agreement between our beliefs or propositions and reality but try to clarify the notion of agreement by asking how agreement is verified. I can see (verify directly) that there is a clock on the wall. But my belief that it tells the time correctly is taken 'on credit'; it will be verified if I act on it and that action does not lead to surprises, for example, a missed appointment. The vast majority of our beliefs are verified even more indirectly. Yet truth is tremendously important. Our existence in the world is precarious; true beliefs lead us to avoid dangers and take advantage of opportunities, while false beliefs may prove fatal. Thus true beliefs are useful and good to believe, but that does not mean that any belief that proves temporarily useful or makes us feel good is true. Not only must any one of our beliefs harmonize with the whole body of beliefs already held - past experience and logic between them leave very little play to the mind - but our new beliefs must prove themselves not merely at the present moment but for the indefinite future. Both common sense and scientific beliefs may have to be modified radically in response to future experiences.

Although James held that the truth is useful to believe, critics who accuse him of identifying truth with usefulness are careless readers. The misreading is, perhaps, encouraged by a hasty reading of his essay 'The Will to Believe' as well as by its unfortunate title. There are certain times when one has to decide to believe 'ahead of the evidence'. We must decide to trust a new acquaintance before we have any basis for trust, else the opportunity of forming a friendship will be lost for ever. What characterizes such situations is that the alternatives before us are equally 'live' for us (we can see ourselves making either choice), that the choice is 'momentous' (much hangs on it; we would not care to toss a coin), and that there is no time to wait for further evidence (waiting is making the choice; in the example, it is to lose the opportunity for friendship). In such cases, and only in such cases, James insists that we have the right to believe. He exercised that right when he chose to believe in free will; as do scientists who commit themselves to investigate as yet untested hypotheses and political reformers who stake their lives on realizing their programmes. It is perhaps worth mentioning that beliefs thus chosen are nevertheless subject to the same verification/falsification processes as are any other beliefs.

6 Radical empiricism

Radical empiricism, found primarily in the posthumously published *Essays in Radical Empiricism* (1912), is James' ontology, his theory of perception and his theory of intentionality. Although James claimed, rightly, that one could be a pragmatist without being a radical empiricist, pragmatism must be able to explain how it is that we live in a world about which we can communicate, which we can change by joint actions, and which any one person's action can change for everyone. The question is urgent because philosophy since Descartes tends to lead to 'a congeries of solipsisms, out of which in strict logic only a God could compose a universe even of discourse' (1912: 37-8). Beliefs in the existence of other minds and of bodies are instinctive, noninferential beliefs, part of the common-sense framework within which we infer what another thinks or what kind of bodies there are. These common sense beliefs do not, however, survive philosophical criticism unaltered. James holds that there is 'one primal stuff or material in the world, a stuff of which everything is composed' but 'there is no *general* stuff of which experience at large is made' 1912: 4, 14). This is not simply a rejection of mind-matter dualism, even talking of a 'stuff' out of which everything is made is misleading; pure experience - the 'primal stuff' - has no essential properties. While the word 'experience' tempts one to understand radical empiricism as a version of Berkeleyan idealism, the view resembles rather a neutral monism, but that it is a label James would have abhorred (see Neutral Monism). In all his writings James emphasized pluralism: a plurality of possible futures, a plurality of irreducible values, a plurality of useful conceptual schemes, a plurality of pure experiences.

Radical empiricism attempts to answer two related questions: how is it that what I take to be my percept of this page of this book is indeed *of* this page (and not of any one of the thousands of exactly similar pages of this book elsewhere), and how is it that my percept and your percept are of the same page when, as we normally say, we are looking at the same page? Analogous questions arise with respect to objects merely thought about. When I see a pen, the experience (call it E) taken in itself, apart from all conceptualization - to the extent that that is possible - is what James calls a 'pure' experience, and the crucial claim made by James is that E is as much an event in the pen's history as it is an event in mine. If we take E with what James calls its 'energetic associates' - with how the pen came to be here and what happens to it hereafter - we have the pen, and if we take E with my prior and subsequent thoughts, feelings, etc. we have my stream of consciousness. This is, first of all, a direct realism. I do not have a sense datum (idea, impression, representation) from which I infer (or 'construct') the pen: I see the pen. And I see its surroundings, I handle it, etc. That is how the mystery of how I can 'mean' this pen rather than any one of the thousands of virtually identical other pens is answered. But who does the 'taking'? It can only be a later item in the stream of consciousness, but just what that item would be is unclear.

To say, as James does, that the context defines the referent when you and I are talking about some absent person presupposes that we live in a common world - that we experience, for example, the same pen as you hand it to me. But how is this possible? No experience of mine is an experience of yours. My-seeing-the-pen is an experience of mine, hence it is not an experience of yours. How then can the-pen-being-seen-by-me be the-pen-being-seen-by-you? James responds that thinking of the pen as my percept (or yours) is a later experience; it is not the 'pure experience' that James calls 'the pen'. *That* pure experience may be appropriated by you as well as by me. As if he realized that this answer might not convince his readers, James adds that 'the decisive reason in favour of our minds meeting in *some* common objects at least is that, unless I knew that supposition, I have no motive for assuming that your mind exists at all…and for me to speak of you is folly' (1912: 38). And, he continues, these objects would be there even if one or more of our minds were destroyed. Indeed, James agrees with common sense that the earth existed before there were any sentient beings and that there will be stars after the last human being has vanished. Once again we are driven to wonder what James can mean by an unexperienced reality. We can easily grasp the idea of a pure experience that does not 'belong' to a physical object (for instance, a hallucination), but what can we make of the idea of a pure experience that is not experienced at all? James himself, perhaps due to this difficulty, toyed with the idea of panpsychism, but this appears to be an unnecessary concession to idealism.

RUTH ANNA PUTNAM

List of works

James, W. (1975-88) *The Works of William James*, Cambridge, MA, and London: Harvard University Press, 17 vols.(This edition includes all previously published as well as many previously unpublished writings by James.

Several of his writings are, however, readily available in paperback. References in the text are to the editions listed below.)

James, W. (1878) 'Remarks on Spencer's Definition of Mind as Correspondence', in *Essays in Philosophy*, Cambridge, MA and London: Harvard University Press, 1978.(The first statement of James' view that the mind is not a passive recipient but actively contributes to what is known.)

James, W. (1890) *The Principles of Psychology*, New York: Dover, 1950, 2 vols.(A monumental work; when it was published and for many years thereafter, it was widely used as a text in psychology courses. Today it is of interest for its many philosophical reflections.)

James, W. (1891, 1897) 'The Moral Philosopher and the Moral Life' and 'The Will to Believe' in *The Will to Believe and Other Essays in Popular Philosophy*, New York: Dover, 1956.(A collection of essays almost all of which were originally delivered as lectures to student audiences. This is one of James' most accessible books, and the second essay mentioned is one of his best known.)

James, W. (1895) 'The Knowing of Things Together', in *Psychological Review* 2; repr. in *Essays in Philosophy*, Cambridge, MA, and London: Harvard University Press, 1987.(This volume contains 21 essays from 1876-1910 covering a wide range of topics.)

James, W. (1898) 'Philosophical Conceptions and Practical Results', Appendix to *Pragmatism*, Cambridge, MA and London: Harvard University Press, 1975, 255.(In this lecture to the Philosophical Union at the University of California, Berkeley, James reintroduced Pragmatism twenty years after Peirce's original essays on the subject.)

James, W. (1899) 'What Makes a Life Significant' and 'On a Certain Blindness in Human Beings', in *Talks to Teachers on Psychology and to Students on Some of Life's Ideals*, Cambridge, MA, and London: Harvard University Press, 1983.(The talks to teachers cover topics discussed in *The Principles of Psychology* that are of particular interest to school teachers, but the two essays mentioned are of enduring human interest and do not presuppose any knowledge of either philosophy or psychology.)

James, W. (1902) *The Varieties of Religious Experience*, New York: Collier Books; repr. London: Collier Macmillan Publishers, 1961.(James' most popular book is a careful account and analysis of the various types of religious experience and religious personality, mostly Christian.)

James, W. (1907) *Pragmatism: A New Name for Some Old Ways of Thinking*, Indianapolis, IN, and Cambridge: Hackett Publishing Company, 1907.(A series of eight lectures for educated laypersons; an exuberant presentation of the essentials of pragmatism as James understood it.)

James, W. (1908) 'The Social Value of the College-Bred', in *Essays, Comments and Reviews*, Cambridge, MA, and London: Harvard University Press, 1987.(An address to a meeting of the Association of American Alumnae at Radcliffe College, the essay was published in McClure's Magazine in 1908. The volume is of interest primarily because it contains all of James' writings on matters of political concern.)

James, W. (1909) *The Meaning of Truth*, Cambridge, MA, and London: Harvard University Press, 1975.(This sequel to *Pragmatism* consists of replies to critics and attempts at clarification. *Pragmatism* and *The Meaning of Truth* were published bound together and with an introduction by A.J. Ayer by Harvard University Press in 1978; this is available in paperback.)

James, W. (1910) 'The Moral Equivalent of War', in *Essays in Religion and Morality*, Cambridge, MA, and London: Harvard University Press.(The essay was published in various journals and magazines in 1910 and reprinted in *Memories and Studies* (ed. Henry James, Jr) in 1912. The volume contains twelve essays on various topics.)

James, W. (1912) *Essays in Radical Empiricism*, Cambridge, MA, and London: Harvard University Press, 1976. (This volume, first published posthumously, contains James' most sustained attempt to deal with epistemology, ontology and the theory of intentionality. It is difficult reading, but intellectually highly rewarding.)

Japanese philosophy

The most distinctive characteristic of Japanese philosophy is how it has assimilated and adapted foreign philosophies to its native worldview. As an isolated island nation, Japan successfully resisted foreign invasion until 1945 and, although it borrowed ideas freely throughout its history, was able to do so without the imposition of a foreign military or colonial presence. Japanese philosophy thus bears the imprint of a variety of foreign traditions, but there is always a distinctively Japanese cultural context. In order to understand the dynamics of Japanese thought, therefore, it is necessary to examine both the influence of various foreign philosophies through Japanese history and the underlying or continuing cultural orientation that set the stage for which ideas would be assimilated and in what way.

The major philosophical traditions to influence Japan from abroad have been Confucianism, Buddhism, neo-Confucianism and Western philosophy. Daoism also had an impact, but more in the areas of alchemy, prognostication and folk medicine than in philosophy. Although these traditions often overlapped, each also had distinctive influences.

In its literary forms, Japanese philosophy began about fourteen centuries ago. Confucian thought entered Japan around the fifth century AD*. Through the centuries the imprint of Confucianism has been most noticeable in the areas of social structure, government organization and ethics. Philosophically speaking, the social self in Japan has its roots mainly in Confucian ideals, blended since the sixteenth century with certain indigenous ideas of loyalty and honour developed within the Japanese* samurai *or warrior class.*

The philosophical impact of Buddhism, introduced around the same time as Confucianism, has been primarily in three areas: psychology, metaphysics and aesthetics. With its emphasis on disciplined contemplation and introspective analysis, Buddhism has helped define the various Japanese senses of the inner, rather than social, self. In metaphysics, Buddhist esotericism has been most dominant; through esoteric Buddhist philosophy, the Japanese gave a rational structure to their indigenous beliefs that spirituality is immanent rather than transcendent, that mind and body (like humanity and nature) are continuous rather than separate, and that expressive power is shared by things as well as human thought or speech. This metaphysical principle of expression has combined with the introspective psychology and emphasis on discipline to form the foundation of the various aesthetic theories that have been so well developed in Japanese history.

Neo-Confucianism became most prominent in Japan in the sixteenth century. Like classical Confucianism, it contributed much to the Japanese understanding of virtue and the nature of the social self. Unlike classical Confucianism in Japan, however, neo-Confucianism also had a metaphysical and epistemological influence. Its emphasis on investigating the principle or configuration of things stimulated the Japanese study of the natural world. This reinforced a tendency initiated with the very limited introduction of Western practical sciences and medicine in the sixteenth century.

Western philosophy, along with Western science and technology, has had its major impact in Japan only since the middle of the nineteenth century. The process of modernization forced Japanese philosophers to reconsider fundamental issues in epistemology, social philosophy and philosophical anthropology. As it has assimilated Asian traditions of thought in the past - absorbing, modifying and incorporating aspects into its culture - so Japan has been consciously assimilating Western thought since the early twentieth century. The process continues today.

What in all this is distinctively Japanese? On the superficial level, it might seem that Japan has drawn eclectically from a variety of traditions without any inherent sense of intellectual direction. A more careful analysis, however, shows that Japanese thinkers have seldom adopted any foreign philosophy without simultaneously adapting it. For example, the Japanese philosophical tradition never fully accepted the emphasis on propriety or the mandate of heaven so characteristic of Chinese Confucianism. It rejected the Buddhist idea that impermanence is a reality to which one must be resigned, and instead made the appreciation of impermanence into an aesthetic. It criticized the neo-Confucian and Western philosophical tendencies toward rationalism and positivism, even while accepting many ideas from those traditions. In short, there has always been a complex selection process at work beneath the apparent absorption of foreign ideas.

Both historically and in the present, some Japanese philosophers and cultural critics have tried to identify this selection process with Shintō, but Shintō itself has also been profoundly shaped by foreign influences. The selection process has shaped Shintō as much as Shintō has shaped it. In any case, we can isolate a few axiological orientations that have seemed to persist or recur throughout the history of Japanese thought. First, there has been a tendency to emphasize immanence over transcendence in defining spirituality. Second, contextual pragmatism has generally won out over attempts to establish universal principles that apply to all situations. Third, reason has often been combined with affect as the basis of knowledge or insight. Fourth, theory is seldom formulated in isolation from a praxis used to learn the theory. Fifth, although textual authority has often been important, it has not been as singular in its focus as in many other cultures. Thus, the Japanese have not typically identified a single text such as the Bible, the Analects, the Qur'an or the Bhagavad Gītā as foundational to their culture. Although there have been exceptions to these general orientations, they do nonetheless help define the broader cultural backdrop against which the drama of Japanese philosophy has been played out through history.

1 Archaic spirituality

The earliest accounts of Japan by Chinese visitors, archaeological remains of the prehistoric culture and the earliest recorded prayers and songs all suggest that Japan was originally an animistic culture with shamanistic qualities. The world was understood to be full of *kami*, sacred presences in the form of awe-inspiring natural objects, personal deities, ghosts and clannish guardian spirits. The ancient rituals were apparently designed for appeasing the *kami* so that humans might live in harmony with them and benefit from their powers. The early poems, recorded in such court-sponsored compilations as the *Man'yōshū*, indicate an internal relationship between humanity and nature. That is, the ancients understood humanity and nature to be parts of each other, not independently existing entities related as subject and object. The ancient myths describe the creation of Japan through the fortuitous actions of the deities. For this reason, the world is infused with *kami* or sacred presence.

According to the myths, natural objects such as rocks and streams were originally endowed with speech, a power taken from them because of their noisy bickering and querulous nature. Although natural things lost their voice, they did not necessarily lose their expressiveness. Human beings, if properly attuned to the natural world, could voice that expressiveness in thoughts, words and artefact. In ancient Japanese, the term for this expressive possibility was *kotodama*, the 'spirit' (*dama*) of 'word' (*koto*) and/or 'thing' (also *koto*).

In short, the ancient Japanese worldview understood the gods, the natural world and humanity to be an ontological continuum. It is not precise to say that rocks and trees were the dwelling place of spirits, because that would establish a bifurcation between the spiritual and material instead of a continuity. The term *kami*, therefore, applied to any object where a sacred presence was particularly manifest or concentrated: the Sun Goddess Amaterasu, Mount Fuji, a special tree or waterfall, the emperor or the vengeful spirit of a fallen warrior. Even the sword of that warrior might be treated as *kami*. This represents one enduring idea in Japanese culture, the emphasis on spiritual immanence instead of transcendence: the sacred permeates the everyday world.

2 The importation of Confucianism and Buddhism

The Chinese writing system was introduced into Japan at about the beginning of the fifth century AD, but it was not until the eighth century that a viable adaptation was devised for rendering Japanese in written form. Therefore early Japanese thought was expressed in Chinese, and in fact many philosophical intellectuals continued to write in Chinese (or a Japanized version of Chinese) as late as the nineteenth century.

When the Chinese writing system was first introduced, the various clans had begun to form a central government under the leadership of what would become the imperial family. The government coalesced in Yamato, a large plain adjoining what is today Kyoto, Nara and Osaka. With the introduction of Chinese literacy, the Japanese elite gained access to more than a millennium of Confucian and Buddhist philosophy. These ideas were immediately put to use in organizing the state.

Confucianism gave Japan a hierarchical model for social and political order. It focused on personal interaction, explaining the responsibilities and duties relevant to the five basic dyadic relations: master-servant, parent-child, husband-wife, elder sibling-younger sibling and friend-friend. When the dyadic relationships are hierarchical, the person in the superior position is to care for the person in the lower and the person in the lower position is to be

loyal to the superior. The imperial family used this system to institute a vertical bureaucracy. Although Confucianism supplied a social structure to the state, the ancient Japanese showed little interest in developing Confucian philosophy *per se* (see Confucian philosophy, Japanese).

Buddhism, on the other hand, was initially most attractive to the Japanese for its aesthetic and thaumaturgic qualities. Buddhist artisans, often immigrants from Korea, brought new techniques of grand architecture, painting, sculpture and music. Using these elegant accoutrements in its rituals for healing, prosperity and protection of the state, Buddhism sometimes competed with the indigenous religious practices addressed to the *kami*.

From the philosophical perspective, however, the most important impact of Buddhism was its psychology. Through its meditative techniques and advanced analyses of the human predicament, Buddhism heightened the Japanese awareness of the workings of heart and mind. Buddhism teaches that egoism is the primary cause of human anguish and dissatisfaction. The ego seeks permanence and control in a world of continuing flux. By controlling the desires and eliminating egoism, one can achieve peace and inner harmony. These Buddhist teachings brought a dimension of inner awareness and psychological analysis to a culture that had formerly operated only within the concepts of taboo, purification and animistic appeasement (see Buddhist philosophy, Japanese).

At the same time, the indigenous religion began to define itself in relation to its rival, Buddhism. It took the name *kami no michi or shintō*, the 'way of the *kami*'. The state helped to systematize a series of myths in the eighth century, explaining the relationships among the tutelary *kami* of the various powerful clans and, presumably, the political relationships among the clans themselves. Most critically, through its familial relation with the chief *kami*, the Sun Goddess Amaterasu, the throne established itself as the blood tie between the celestial *kami* and the Japanese people (see Shintō).

A major goal of philosophy in the seventh and eighth centuries, therefore, was to integrate the available ideas, both foreign and native, into a systematic worldview in the service of political stability. In this light the Seventeen Article Constitution of AD 604 is one of the first philosophical documents of ancient Japan (see Shōtoku Constitution). Attributed to Prince Shōtoku (574-622), the Constitution is really more a set of guidelines for bureaucrats than a set of laws defining political structure. In it, however, we find the early impact of Chinese thinking and its adaptation to the Japanese context of the time.

The Constitution's first article opened with a quotation from Confucius about the importance of maintaining 'harmony'. As noted already, in traditional Confucianism one achieves harmony primarily through performing actions appropriate to one's relationships in the society. Rather than discussing such Confucian principles, however, a large portion of the Constitution discussed human frailty and the need to develop a sympathetic attitude. The Constitution admonished against hypocrisy, preferential treatment, envy and egocentric motives. On the positive side, it advocated consensus and open-mindedness. In short, while the document aimed for a harmonious Confucian social order, it also drew on Buddhist psychology to explain the obstacles to harmony and to suggest an introspective understanding of personal motivations. Although the Constitution itself lacked any detailed philosophical argument, it marks an early attempt to draw on multiple philosophical traditions in a coherent manner. In effect, it advocated a Confucian social and government order (see Confucian philosophy, Japanese) supported by Buddhist practice and the insights of Buddhist psychology. This philosophy of government remained dominant in Japan for at least a millennium.

In the Nara period (710-94), Japanese scholar-monks secured court support to accumulate and study more texts in Buddhist philosophy. They organized themselves loosely around major traditions from the mainland, and became the Six Nara Schools of Buddhism: Ritsu, Kusha, Jōjitsu, Hossō, Sanron and Kegon (see Buddhist philosophy, Japanese). The first primarily concentrated on the study of Vinaya, the precepts and regulations for ordering monastic life. The Kusha and Jōjitsu were schools of Abhidharma Buddhism emphasizing the detailed analysis of dharmas, the basic constituents of reality or consciousness (see Buddhism, Abhidharmika schools of). The Hossō was primarily based in the Indian Yogācāra tradition and Sanron in the Mādhyamika (see Buddhism, Yogācāra school of; Buddhism, Madhyāmika: India and Tibet). Kegon represented the tradition known in China as Huayan. Although the Six Nara Schools played an important role in both education and court politics, there is little evidence that they were philosophically creative centres. Their historical role was mainly to introduce Buddhist analysis and doctrine into Japanese culture. They provided the intellectual raw material for the later philosophical

developments of the Heian period.

3 Metaphysical vision of ancient Japanese esoteric Buddhism

Although already a significant presence in the Nara period, only in the Heian period (794-1185) did Buddhism undergo a profound process of philosophical development and Japanization. Two Buddhist thinkers were particularly influential: Kūkai (774-835; posthumous title, Kōbō Daishi) and Saichō (767-822; posthumous title, Dengyō Daishi). Of the two, Kūkai's philosophical contribution was the more comprehensive. He went to China in 804 to study esoteric Buddhism and, upon his return two years later, founded Japanese Shingon Buddhism. The analytic and systematic character of Kūkai's writings may well qualify him as the first true philosopher in Japanese history.

For Kūkai, reality is fundamentally a person. The entire cosmos is no more than the thoughts, words and deeds of the Buddha called Dainichi (literally the 'Great Sun'). Dainichi is not the creator of the universe; Dainichi is the universe. In a perpetual state of enlightened meditation, Dainichi performs the three great practices of esoteric Buddhism: the chanting of sacred syllables (*mantras*), the visualization of geometrical arrays of symbols (*mandalas*) and the performance of sacred postures or hand gestures (*mudras*). These three activities define the nature of the universe. The *mantras* are microcosmic resonances or vibrating states of matter-energy that constitute the basic elements. The *mandalas* define the essential structure, and the *mudras* constitute the patterns of change. By performing the rituals of *mantra*, *mandala* and *mudra*, a person achieves immediate insight into the nature of the cosmos. By introspection on the nature of their own thoughts, words and deeds, the Shingon Buddhist is said to achieve insight into the thoughts, words and deeds of the Buddha, Dainichi. By understanding one's own person, one understands the person that is all of reality.

Within the framework of this metaphysical system, Kūkai developed a comprehensive philosophy addressing several major philosophical issues. For example, he criticized the idea that insight or enlightenment could be purely mental or intellectual. Because the universe itself consists of thought, word and deed (or structure, resonance and patterned change), it can only be grasped by unified praxis of the whole person: mind, speech and body. To know reality is to participate in it fully, in all three of its dimensions.

Another philosophical issue of interest to Kūkai was the nature of expression. Because the cosmos is a person, reality is the expressive style of that person. Every entity is, therefore, a symbol or imprint of Dainichi's mental, somatic and verbal activity. Yet, because we contain the element of volitional consciousness, we humans can also ignore the true source of all activity, construing ourselves as independent entities. We can interpret things through the superimposition of our own imprints, covering over their (and our) more fundamental nature. This delusion is the source of human anguish and ignorance. The escape from delusion lies in recognizing and participating in the self-expressive nature of reality.

Kūkai's contemporary and major competitor, Saichō, founded Japanese Tendai Buddhism. Although Saichō's primary goal in visiting China was to bring back to Japan the teaching of the Tiantai Buddhist tradition (see Buddhist philosophy, Chinese §7), he also had a chance encounter with a teacher of esotericism. When he returned to Japan, therefore, his Tendai school incorporated esoteric Buddhist elements as well as exoteric Tiantai teachings. Through the exchange of Shingon and Tendai disciples in Japan, some of Kūkai's esoteric teachings also found their way into Tendai. The result was that by the end of the ninth century, the two dominant forms of Japanese Buddhism were both at least partially esoteric in nature.

We can explain the influence of the esoteric Buddhist theory of reality from both the standpoint of cultural history and the history of philosophy. Culturally, it is important that esoteric Buddhism did not either doctrinally or politically oppose the presence of the indigenous religion, Shintō. Esoteric Buddhism reinforced rather than challenged many aspects of the indigenous religious worldview: the ubiquity of the sacred, the expressiveness of nature and the nonduality of matter and spirit, for example. Furthermore, both Kūkai and Saichō correlated the various buddhas of esotericism with the various *kami* of the traditional Japanese religion. By this process, Japanese archaism was, in effect, defended by a philosophically sophisticated system of Buddhist thought imported from the mainland and adapted to the Japanese context. Buddhism and Shintō could therefore be practised alongside each other without contradiction.

This development set the metaphysical backdrop against which later Japanese thought would develop. One might

say that esoteric Buddhism did for Japanese philosophy what Plato and Aristotle did for Western philosophy. It laid out a set of assumptions and a *Problematik* that had a profound influence on the thought to follow. Two assumptions were particularly influential.

First, esotericism has a distinctive view of the relation between part and whole. The whole is recursively manifest or reflected in the part. It is not that the parts constitute the whole nor that the whole is more than the sum of its parts; rather, since the part is what it is by virtue of the whole, if we truly understand the part, we find the whole imprinted in it. In Shingon's case, for example, since any individual thing is an expression of the cosmos as Dainichi, when we truly understand the part (the individual thing), we encounter the whole (Dainichi) as well.

With this orientation as a cultural presupposition, later Japanese philosophers would seldom endorse either atomistic analysis or individualism (see Atomism, ancient; Methodological individualism). Atomistic analysis had been introduced into Japan via the Nara Schools of Jōjitsu and Kusha. Kūkai explicitly ranked them as philosophical 'mindsets' far below Kegon and Tendai, in part because only the latter endorsed this theory of whole-as-part. Individualism, with attendant theories of social contract, entered Japan via the West only in the late nineteenth century. Since it viewed the social whole as constituted by the parts, it ran counter to this esoteric assumption. Not surprisingly, individualism has never taken hold in Japan as a basis for social, ethical or political theory.

Second, esotericism's metaphysics argued that reality is self-expressive. Human beings are, of course, part of reality. When humans speak authentically or truly, therefore, they do not refer to reality, but rather are part of its self-expression. This position undermines any philosophical tendencies toward idealism (reality as a production of mind), realism (reality as pre-existing our expressions and truth as matching our expressions with that reality) or radical nominalism (expressions refer primarily to other expressions without necessary connection to non-linguistic reality) (see Idealism; Realism and antirealism; Nominalism). In the Nara Schools there were variants of idealism (Hossō), realism (Kusha and Jōjitsu) and nominalism (Sanron). Again Kūkai ranked them all below Kegon and Tendai, and certainly below what he believed to be the only comprehensive mind-set, esotericism.

This presupposition about the self-expressive nature of reality underlies most Japanese aesthetic theories as well. The Heian period was the first to develop a detailed set of aesthetic terms, for example, *miyabi* (cultured, refined elegance) and *mono no aware* (the 'ah-ness of things' or the aesthetic tinge of sadness arising from an appreciation of the evanescent). In later periods, other aesthetic terms such as *yūgen* (hidden sublimity or depth), *sabi* (the 'loneliness' of an elegance allowed to age) and *wabi* (rusticity) came to the fore. These terms have rich connotations not readily translated into English. In general, though, they signify equally a quality of the object and the response of the aesthete or artist. The aesthetic is understood to be a self-expressive resonance between the object and artist. The world expresses itself through the artist as the work of art (see Aesthetics, Japanese).

4 Medieval philosophical anthropology: Pure Land Buddhism

During the Heian period the highly literate and elegant culture of the Kyoto court was at its peak. The aesthetically pleasing rituals of esoteric Buddhism found a receptive audience among the aristocrats and clergy. They alone enjoyed the leisure time, education and resources to devote their lives to its study and practice. The general populace were left to their folk religions, an amalgamation of practices with roots in Buddhism, Shintō and Daoist alchemy.

By the early twelfth century, the court had become so politically effete that the provincial aristocracy began to vie for power and the newly risen *samurai* fought for control of territory. Plagues, famines and earthquakes were also unusually devastating. In short, to any sensitive observer of the times, it was easy to see the decadence of the social order, the harshness of nature and the corruption of the human spirit. There was little time for, or consolation in, metaphysical speculations. The philosophers turned their analyses to this world and their imaginations to wondering what failing in humanity had caused such suffering. By 1185 the Minamoto clan was victorious and in 1192 Yoritomo became *shōgun*, establishing his centre of government in Kamakura. Thus began the Kamakura period (1185-1333) and a new set of philosophical and religious orientations.

The Kamakura period philosophers such as Hōnen (1133-1212), Shinran (1173-1262), Yōsai or Eisai (1141-1215), Dōgen (1200-53) and Nichiren (1222-82) responded to the decay and suffering of their times. Each developed his

own interpretation of the human predicament with an accompanying solution. All had originally trained as Tendai monks, but these reformers eventually left the establishment and founded new Buddhist sects that served the masses as well as the elite echelons of Japanese society. Of the Kamakura schools of Buddhism, Pure Land and Zen have been the most influential in their theories of human being. Shinran was the founder of Shin Buddhism or the 'True Pure Land School; Dōgen was the founder of Sōtō Zen. Each developed most fully the philosophical foundations for his own tradition (see Buddhist philosophy, Japanese).

These two schools differ radically in their philosophical anthropologies. As Buddhists, both Shinran and Dōgen accepted the general Buddhist analysis about the source of ignorance: egoism. Egoism defines the self as an independent agent that initiates actions and has experiences. The Buddhist view, on the other hand, maintains that 'I' is no more than a name for related actions and events, not something that lies behind them. This implies that the boundaries of the self are fuzzy rather than sharply delineated. For example, from a distance we can readily identify the general course of a river, but if we move up close enough, we cannot specify exactly where the river ends and the river bank begins. If the river were self-conscious and tried to specify for itself 'my' boundaries as opposed to 'its' boundaries, the river would lose sight of the very processes that bring it into being and help define it. Analogously, Buddhists generally maintain that egoism, by attempting to define, delineate and protect the self, ignores the self's broader context. It overlooks the self's dependence on what egoism considers to be outside and separate from it.

As a disciple of Hōnen, the founder of the Japanese Pure Land School, Shinran also accepted the specific ideas of that tradition, including the theory that humanity had entered a degenerate period in history. Left to our own devices, we are presumed to be doomed to live and relive an existence of anguish, dissatisfaction and despair. Pure Land Buddhists believe, however, that a celestial buddha called Amida has seen our situation and taken pity on us. He has vowed that if we entrust ourselves totally to his compassion and call on his name, we can be assured rebirth in his Pure Land where the conditions are conducive to Buddhist practice. In his Pure Land we can perform the necessary spiritual disciplines and then return to this world to attain enlightenment. In so doing, we can be a spiritual aid to others in this world. Such was the basic tradition of Pure Land Buddhism that Shinran accepted. Within that traditional framework, however, he developed his own distinctive philosophical analysis of human being.

Shinran believed he had found a contradiction in how most Buddhists understood practice. Specifically, they self-consciously undertook various disciplines (meditation, reading texts, chanting mantras) as a means of eliminating egoism and attaining insight into reality. The implication is that one can overcome egoism by one's own power, by 'self-power.' People believed they were 'earning merit' by their religious practices. Shinran argued that if people practice as a means of achieving merit, then the actions only feed, rather than eradicate egoism: discipline is understood as a means by which *I* can improve *myself*. Shinran considered this emphasis on self-power to be the psychological foundation of the degenerate age in which he believed he lived. Because people misunderstood the relation between self and Buddhist practice, the teachings of Buddhism had indeed become unintelligible and the prospect for insight had disappeared.

Although Shinran did not explicitly deny the ontological reality of the Pure Land or the account of Amida's vow as historical, his philosophy focused more on the psychological and logical implications of the Pure Land position. For him the fundamental point was that people must surrender their egoistic senses of self by adopting an 'entrusting heart-and-mind' (*shinjin*). By completely abandoning the ego, people can have faith in the power of Amida's vow to help. They turn from 'self-power' to 'other-power.' Assured birth in the Pure Land, the realm devoid of egoism, the sense of a discrete or independent self will disappear. Yet, Shinran reasoned, if there is no self at that point, logically there can be no discrete 'other' either. There is just 'naturalness' and Amida in effect disappears as well. *Shinjin* continues as the entrusting that opens itself to this naturalness. In that egoless state, one can spiritually help other people. It can be said that one returns from the Pure Land to be reborn in this world. Yet, by assisting others in this world, the ego may once again be constituted as the 'I' who self-consciously helps 'others.' As soon as one begins to think that good deeds are done by virtue of one's own power, the whole process must be renewed. One must again see the delusion of the ego, again turn oneself over to Amida's power, again be reborn in the Pure Land, again allow self and Amida to disappear, and again return to this world from the Pure Land.

In short, Shinran agreed that to eliminate ignorance one must eliminate egoism. This can be accomplished, he believed, only by the complete renunciation of the notion that one can help oneself. Only by despairing of the efficacy of self-power and by entrusting oneself to Amida's power can one become naturally what one truly is (see Self-realization). In that egoless state one can understand reality for what it is and act freely in the world as a compassionate being. In addressing the same issue, Zen Buddhism took an almost diametrically opposed approach, however.

5 Medieval philosophical anthropology: Zen Buddhism

Like the Pure Land Buddhists, Zen Master Dōgen believed there is a fundamental flaw in the usual interpretation of Buddhist practice as the means to enlightenment. Rather than arguing that practice must be abandoned, however, he instead maintained that practice or self-discipline is an end in itself. He rejected the popular theory that his was a degenerate age in which enlightenment was no longer possible. Instead, Dōgen maintained everyone is already enlightened, but that enlightenment was not being manifested or expressed in their actions. The goal, therefore, is to authenticate what we already are.

Trained in the Zen (Chan) Buddhist tradition in China, Dōgen was sensitive to the limitations of language and mistrustful of certain types of thinking. Like other Buddhists, he understood the problem to be egoism. By hypostatizing the ego, one falls into a desire for reality to be a specific way. One seeks permanence in both self and in one's own worldview. Therefore, it is easy to project interpretations on experience, interpretations that shape the experience to meet our presuppositions, expectations and desires.

Dōgen believed that experiential immediacy is possible. In Zen meditation, one quiets the mind and merely lets phenomena appear. Dōgen called this a state of 'without-thinking' as opposed to either 'thinking' or 'not-thinking'. Thinking, for Dōgen, included any form of sustained conceptualization whether fantasy, cogitation, believing, denying, wishing, desiring or whatever. Not-thinking is the effort to blank the mind and empty it of all awareness. In without-thinking, however, there is the awareness of brute phenomena but no sustained act of bestowing meaning. There is no consciousness of a self having an experience. Furthermore, since no meaning at all is projected on the event, it is free of the distortions found in ordinary, ego-driven forms of experience. Dōgen simply called this 'the presencing of things as they are'.

Dōgen claimed this form of meditation was not a means to enlightenment. Instead, precisely because it is egoless, it is enlightenment itself. Yet, this meditation-enlightenment event is always accessible. It is, as it were, at the root of all experience, even thinking and not-thinking. In this respect we are all already enlightened but we have not authenticated that fact. Of course, to authenticate it, we must return to a state of without-thinking.

Without-thinking is, therefore, a not-yet-conceptualized immediacy. Since it is without concepts, however, it is intrinsically meaningless; but it is impossible for humans to live a life without meanings. Enlightenment must not only be authenticated in meditation. It must also be expressed in everyday life. How can this be possible?

Dōgen claimed that meaning is always contextual. He noted that the ocean has a different meaning to a fish swimming in it, a person in a boat out at sea and a deity looking down at it from the heavens. To the fish, the ocean is a translucent palace; to the person it is a great circle extending to the horizon in all directions; to the deity it is a string of jewel-like lights glittering in the sunshine. If the deity were to interpret the ocean as a circle or the person in the boat were to interpret it as a palace, however, they would not be expressing what is actually in front of them. Their interpretation would be false. Therefore, the key to truth in meaning is the appropriateness of the context.

According to Dōgen, meditative without-thinking is the 'touchstone' for determining whether the context is appropriate. Context is continually shifting and giving rise to new meanings as we live out our lives. What is 'tree branch' at one point may be 'firewood' at another and 'weapon' in a third. Dōgen referred to these points as 'occasions' of 'being-time'. For Dōgen, the problem with egoism is its resistance to accepting flux. Egoism tries to make a set of previous meanings into a fixed worldview, into *my* reality. Therefore, one projects contexts that are not actually present in the current phenomena. Through meditation, however, one can break the closed cycle of self-verifying projections. One can return to the presence of things as they are before meaning, before they are embedded in any particular context. Then, as one returns to the expressive world of everyday action, it is easier to verify the appropriateness of the contextualizing process that generates meaning (see Meaning and verification).

The philosophical anthropologies of Pure Land and Zen address the common problem of egoism, but their solutions to the problem are fundamentally different. In Pure Land Buddhism, recognizing the inefficacy of egoism leads to a psychodynamic of despair, entrusting and naturalness. In the Pure Land philosophy of human being, the ego is rejected in favour of a model of dependence or interdependence. It is a process of self-effacement and surrender. By contrast, Zen overcomes the negative effects of egoism not by self-effacement, but by self-analysis. One studies the dynamics of consciousness and grounds oneself in pure, but meaningless, presence. Pure Land and Zen agree that self-discipline is not a means to enlightenment. Yet, for Pure Land this entails the rejection of self-discipline; in Zen, on the other hand, it entails the acceptance of self-discipline as an end in itself.

These two philosophical anthropologies exemplify how Kamakura philosophers generally focused on the nature of praxis as part of an analysis of human existence. In the Heian period, the pressing philosophical question seems to have been the nature of the cosmos. In the Kamakura period it shifted to the nature of the self. Shinran and Dōgen produced particularly impressive analyses of human motivation and the structure of consciousness, and their models of the self remain influential in Japanese culture up to the present. It is significant, however, that their focus was primarily on the inner self instead of the social self. The social dimension was to become a major concern in the next major period in the development of Japanese philosophy.

6 Neo-Confucianism, the *samurai* code and Tokugawa society

Following the Kamakura period there were more periods of intermittent warfare and internal strife. A long lasting, nationwide peace arrived only with the establishment of the Tokugawa family's regime as *shogun*s. For nearly all of the Tokugawa period (1600-1868) Japan closed itself off from most interaction with outside world. For example, Christianity, which had been introduced by missionaries in the sixteenth century, was formally proscribed. The Tokugawa *shogun*s established a highly bureaucratic government, giving them unprecedented control over Japanese society from its system of education to its business practices and religious institutions. In this context, much of philosophy turned to the interests of the state and the definition of social responsibility.

During the fifteenth and sixteenth centuries, Japan had again received a strong infusion of foreign thought. In particular, Zen Buddhist monks who had visited the mainland brought back to Japan texts of the neo-Confucian traditions established in China by Zhu Xi and Wang Yangming. Since Japanese Buddhist philosophy taught little about social responsibility in secular contexts, the ethical dimension of these texts attracted increasing attention. Neo-Confucianism went further than traditional Confucianism by adding a metaphysical level to explain the natural world and how it could be known (see Neo-Confucian philosophy).

From ancient times Confucianism had played a major role in the social, bureaucratic and ethical structures of Japanese culture. In trying to organize and stabilize the government after centuries of warfare, the Tokugawa *shogun*s were naturally intrigued by this new and more comprehensive form of the social philosophy that had already served Japan in the past. Furthermore, wary of Buddhism's popularity, they probably welcomed neo-Confucianism's challenge to the near hegemony that Buddhism had established in Japanese philosophy. In any case, from early in the seventeenth century, the Tokugawa *shogun*s gave special status and support to neo-Confucianism, especially to the school called Shushigaku, the Japanese school of Zhu Xi.

With the increased peace and prosperity of the Tokugawa period, there was a new market for philosophical education, especially in the great urban centres of Kyoto, Osaka and Edo (now Tokyo). The rising merchant class wanted the social polish of an upper class education. Furthermore, because it was peacetime, many unemployed *samurai* wanted a classical education to qualify for positions in the government bureaucracy. The result was an increase in independent schools and a proliferation of teachers with different philosophical approaches.

Generally we find major philosophical development during the Tokugawa period in two areas: naturalistic metaphysics and social philosophy or ethics. The Shushigaku school introduced a theory of reality or metaphysics foreign to the Buddhist theories so entrenched in Japanese thought. In particular, it analysed reality in terms of the dynamic between 'configuration' or 'principle' (*ri*; in Chinese, *li*) and 'material energy' or 'vital force' (*ki*; in Chinese, *qi*) (see Li; Qi). According to Shushigaku, *ri* gives the universe its structure and, since *ri* is also in the mind, it is the foundation of knowledge. By 'investigating the nature of things' we come to know *ri*, both in ourselves and in the things we study. *Ki*, on the other hand, was considered the basic stuff that is ordered by *ri*.

Although the notion of *ri* was known to the Japanese through Tendai and Kegon Buddhism, the neo-Confucians

gave the term a distinctive emphasis. They embedded it into the broader enterprise of understanding of the natural world. During the Tokugawa period there was a practical interest in better understanding nature; in the sixteenth-century traders, and missionaries from Europe had introduced some Western science. With the closure of Japan this contact was severely limited, although the occasional Dutch treatise on practical science or medicine did find its way into Japan.

For the most part, Japanese philosophers found the Shushigaku emphasis on *ri* to be overly abstract. To many, it seemed that *ri* was an unnecessary transcendent realm behind physical reality that could be known only through some mysterious half-contemplative, half-empirical study. In response, many Japanese thinkers took a more phenomenalistic approach. Kaibara Ekken (1630-1714), for example, argued for the primacy of *ki*. To him, *ki* was the basic constituent of reality and should be studied directly; *ri* was no more than the name for the patterns one could abstract from the behaviour of *ki*. Certainly from the perspectives of both medicine and the martial arts, *ki* became the more important category in Japan.

Other naturalistic philosophers such as Miura Baien (1723-89) developed intricate systems of their own for categorizing natural phenomena. Such indigenous concerns for observation and classification of the natural world may not have developed into a full-blown science in the Western sense, but the orientation did show an increasing Japanese concern for observing and understanding the natural world. This phenomenalist tendency would serve Japan well in the nineteenth century when Western science and technology were reintroduced.

In the field of social or moral philosophy, an important development was the emergence of the school of ‘Ancient Learning’. Led by Yamaga Sōkō (1622-85), Itō Jinsai (1627-1705) and Ogyū Sorai (1666-1728), these philosophers rejected the metaphysical speculations of the neo-Confucianists and tried to return to the early classics of the Confucian tradition, especially the *Analects* (see Chinese philosophy; Confucian philosophy, Chinese; Confucius). They developed sophisticated philological and exegetical skills as tools for attempting to discover the original meanings of those texts. Their goal was to clarify traditional Confucian social philosophy so that it could become the basis for Japanese society. In this regard, the school of Ancient Learning put its emphasis on the nature of virtue and the development of character. Ogyū Sorai had an especially broad impact on society for his theories about education and moral training.

Some philosophers, like Yamaga Sōkō of the Ancient Learning School, mixed Confucian values with warrior values about loyalty and honour. Yamaga tried to develop a warrior mentality for service to the state that would be appropriate to peace time. Furthermore, in their unemployment, many *samurai* entered the various Buddhist orders, especially Zen, where they found a familiar emphasis on discipline and regimentation. The combined result was an idealized code of the warrior (*bushidō*) as a way of life, even for non-*samurai* and even in times of peace (see Bushi philosophy).

7 Native studies: religio-aesthetic foundation of the Shintō state

The school of Ancient Learning’s return to the original classics of Chinese Confucianism was mirrored in a movement to return to the early texts of Japan, the school of ‘Native Studies’ or ‘National Studies’ (*kokugaku*). Originally a literary and philological group, Native Studies scholars like Keichū (1640-1701), Kada no Azumamaro (1669-1736) and Kamo no Mabuchi (1697-1769) analysed the language and worldview of Nara and Heian poetry and prose. The school expanded beyond these literary goals, however, as it turned to questions of religion and national identity. In this development the philosophy of Motoori Norinaga (1730-1801) played a pivotal role.

The major shift in Native Studies began with Motoori’s decision as a philologist to decode the antiquated writing system of the *Kojiki (The Record of Ancient Matters)*. An eighth-century text, the *Kojiki* was supposedly the written version of what had formerly been an oral tradition. Mixing myth and history, it discussed the origins of the world, the formation of Japan and the succession of Japanese emperors from the beginning of time up to its present. There was a twin work in Chinese written at the same time, *Nihon shoki (The Chronicle of Japan)*. Because the orthography of the *Kojiki* died out as a writing system for Japanese shortly after the Nara period, the *Nihon shoki* became the more used text, supposedly containing the same information. The *Kojiki* had in fact become virtually unintelligible even to the educated Japanese of Motoori’s time. By decoding the text, therefore, Motoori hoped to bring to light the original Japanese worldview.

A devout follower of Shintō, Motoori's task assumed a profoundly religious dimension as well. He believed the *Kojiki* was a written account of what had been orally transmitted word for word from the time of creation. The *Kojiki* contained the very words of the deities who had created the world. Furthermore, since the text was written in an orthography that had soon fallen into disuse, Motoori believed the written text was uncorrupted by later interpreters, making it superior to the adulterated cosmogonies of other cultures. This firm belief sustained Motoori's lifelong devotion to the enormously complex task of decoding the text.

Based on his readings of Japanese classics, Motoori also developed a philosophy of poetic or religious expression: his theory of 'heart' (*kokoro*). As a technical term, *kokoro* designates the seat of thinking and feeling; it is the basis of sensitivity (see Kokoro). Heart is not, however, limited to people; things and words also have heart. If poets have 'genuine heart,' they will be touched by the heart of things and the heart of words. The poetically or religiously expressive act, therefore, is an act of the heart, something shared by the things, the person and the words. Since the genuine heart is also a goal of Shintō purification, Motoori saw in this theory the basis of religious language as well. This in turn influenced his understanding of the significance of the *Kojiki*.

If the *Kojiki* represents the original words of the deities at the time of creation, to read or study the text is virtually a ritualistic re-enactment of creation. The implication for Motoori was that the ancient Japanese language of the text is not only the language of the deities, but also the most pure intimation of the heart of things. By this line of reasoning, Motoori made the *Kojiki* into the sacred scripture of Shintō. Based on his reading of the text, Motoori founded a philosophy of Shintō supposedly free of Buddhist influence. For virtually the first time, Shintō could develop a formal doctrinal system of its own (see Shintō).

This line of thought readily supported a nationalist ideology. If the ancient Japanese language was the protolanguage of all languages, if that language were most purely resonant with the heart of things and if the Japanese emperor was the special link between the deities and humanity, obviously Japan would have a special place in the world. This sense of national superiority became especially strong in the next generation of Native Studies scholars such as Hirata Atsutane (1776-1843) and helped contribute to the movement to overthrow the Tokugawa shogunate and restore the emperor as the true leader of Japan. In this effort, it found an intellectual ally in the Mito School, a Shintō-Confucian synthesis, that argued for the centrality of the emperor as the 'body of the state'. The restoration of the emperor was completed in 1868, the beginning of Japan's modern era.

In summary, the introduction of neo-Confucianism from China and the establishment of a stable state under Tokugawa rule created a new fertile environment for Japanese philosophy. Ultimately, neo-Confucianism itself did not become a dominant philosophy in Japan, but its presence challenged the dominant Buddhist philosophies. In this new context Japanese philosophy grew more concerned with social ethics, the study of the natural world and cultural identity. In this period developed the idea of the warrior-turned-bureaucrat, as fiercely loyal to the organization as formerly to the lord. As there was more interest in studying and classifying the physical processes of nature, there was also a newly defined aesthetic of sensitivity and poetic expression (see Aesthetics, Japanese). For the first time, Shintō became a major intellectual force in Japanese thought and there was an attendant sense of the uniqueness and superior quality of Japanese culture. All these factors became the intellectual background for the emergence of the modern era after 1868, and its related philosophies.

8 Modern Japanese philosophy and its critique of Western philosophy

The Tokugawa policy of seclusion ended with the appearance of US gunboats in 1854 and their demand that Japan open itself to international trade. To protect its sovereignty from infringement by the Western powers, Japan believed it had to become a modern industrial and military power in its own right. The government sent its brightest young intellectuals to Europe and the United States to study what was needed for modernization, such as medicine, engineering, agriculture, postal systems and education. This effort included the study of Western thought as a means to understanding Western society and the ideas behind its science and technology. Although there was some sustained interest in American pragmatism (see Pragmatism), most Japanese philosophers turned toward Germany for their inspiration (see German idealism).

Throughout the nineteenth century, most Japanese leaders hoped Japan could superimpose Western science and technology on a society that remained true to Asian cultural values. By the first decade of the twentieth century, Japan had successfully developed the technology and military might needed to defeat both Russia and China in

wars. Many Japanese intellectuals feared, however, that this was at the expense of traditional values. The ideal of detached objectivity in Western science threatened the tradition of apprenticed learning through imitation of the master. The Buddhist and Confucian theories of reality were in jeopardy of being overwhelmed by Western scientism. The new egalitarian ideals of education so helpful in developing a technological society were also part of a democratic worldview that emphasized the individual as basic unit of society and threatened the traditional Confucian virtues and social hierarchy. How to negotiate the differences between traditional Asian and modern Western values became a major concern among Japanese philosophers in the first half of the twentieth century.

The most influential development in modern Japanese philosophy was the emergence of the Kyoto School of thought (see Kyoto School). By the early twentieth century, philosophy had become an academic study in Japanese universities. An influential circle of philosophers clustered around Nishida Kitarō (1870-1945), a professor at Kyoto University. This group tended to address problems about the meaning of self, the nature of knowledge, the role of spirituality and the place of both ethical and aesthetic value.

Nishida was the single most influential philosopher in the prewar period. His philosophical goal was to locate empiricism and scientific thinking within a larger system that would also give value judgements a non-subordinate place. *Zen no kenkyū (An Inquiry into the Good)*, his first major work, developed the notion of ‘pure experience’, an idea adapted from William James and perhaps developed in light of Nishida’s own Zen Buddhist practice. The book’s theme is that there is a thrust toward unity in all experience. Thought arises out of the disruption of the unity of immediacy and serves as a means to establishing a more comprehensive unity. In Nishida’s phrase, pure experience is the ‘alpha and omega of thought’.

Nishida himself subsequently decided this early effort was too ‘psychologistic’ and ‘mystical’, and developed a different philosophical system in the 1920s and 1930s that emphasized the ‘logic of place (or *topos*)’. According to Nishida, every judgement is restricted by the logic of its context, which in turn derives from a broader experiential domain that it cannot explain in its own terms (see Logic in Japan). An empirical judgement, for example, excludes the subject of the experience (see Empiricism). Its internal logic precludes the consideration of the self. Yet, of course, there can be no empirical data without an experiencing subject; so, the logical place within which empirical judgements are made is within a broader experiential context that assumes the function of the self. If that broader context is then made the logical domain for judgements, we have idealism. In turn, according to Nishida, the experiential locus that makes idealist judgements possible cannot be spoken of logically within the domain of idealism. Nishida calls this experiential locus ‘place of absolute nothingness’, the ground of ‘acting-intuiting’. This region cannot be expressed in any logical form, but is the basis of all logical expression. It is also the ground of value: spiritual, ethical and aesthetic.

In this way, Nishida argued that the realm of empirical judgement is necessarily grounded experientially in a realm of value that it cannot analyse from its own standpoint. Nishida’s system attempted to grant Western science its logical place while showing that its experiential ground was what traditional Asian values had affirmed all along. Religion, at least in its Asian forms, was not antagonistic to science, nor was it endangered by science. On the contrary, Nishida argued that spiritual experience is what makes science logically possible.

Nishida argued for the synthesis of Eastern values and Western values by analysing the logic of epistemology. He was joined in this logical or epistemological approach by other philosophers connected in some way with the Kyoto School such as Tanabe Hajime (1885-1962) and Nishitani Keiji (1900-90). Other Kyoto School philosophers addressed the issue from the other direction, by analysing values. Hisamatsu Shin’ichi (1889-1980), for example, analysed the religio-aesthetic worldview of Zen Buddhism, advocating it as the basis for a style of life. Miki Kiyoshi (1897-1945), on the other hand, developed a ‘logic of creativity’ inspired by both Buddhist and Marxist theories of praxis.

Among the modern Japanese ethicists, the most influential was Watsuji Tetsurō (1889-1960), a professor at Tokyo University and not technically a member of the Kyoto School. Watsuji explained that Western ethics takes the individual for its prime locus. Western ethics is constituted *vis-à-vis* individual needs and the focus of morality is the individual agent. In contrast, Watsuji said, Confucian ethics takes the social as its prime locus, being constituted out of the primary social relations. Watsuji maintained both traditions are faulty in seeing only one dimension of the whole. As an alternative, he developed a philosophical anthropology emphasising ‘betweenness’, a dialectical tension between the individual and the collective. The collective establishes norms within which one

can act in a given society, whereas the individual serves as the locus of freedom. If unqualified by the opposing pole, the collective suppresses freedom and the individual rejects the objective validity of norms.

Watsuji concluded, therefore, that true ethical behaviour is possible only as a ‘double negation’ that rejects both poles without settling in either. In this ‘betweenness’ we find the dialectical tension between the social and the individual, the fundamental definition of our human being. So, the nature of ethics follows from the definition of human being, and ethics is the fundamental way of realizing our humanity. Watsuji developed these ideas first in his *Ningen no gaku to shite no rinrigaku (Ethics as the Study of Human Being)* (1934) and then more fully in his *magnum opus*, a three-volume work called simply *Rinrigaku (Ethics)* (1937-49).

9 Postwar developments

The defeat in the Second World War caused many philosophers to rethink their positions. Tanabe and Watsuji, for example, explicitly repented some of the nationalistic implications of their earlier writings. In his *Zangedō to shite no tetsugaku (Philosophy as Metanoia)* in 1946, Tanabe developed an intricate, self-critical dialectical method to check the emergence of philosophical ideologies. In conceiving this method he drew inspiration from the philosophical analysis of Shinran’s thought done by one of his students, Takeuchi Yoshinori. The connection with religious philosophy has become a recurrent theme in the further development of the Kyoto school as exemplified in the works of Nishitani, Takeuchi and Ueda Shizuteru. In a spirit reminiscent of the Kamakura Buddhist thinkers, many of the postwar philosophers have turned inward to re-examine the nature of human existence, now able to be formulated in relation to the problematics of existentialism as well as Buddhism.

At the same time some Japanese philosophers have continued to specialize in the scholarly study of Western philosophy. In many Japanese universities there are departments of philosophy where much of the work is indistinguishable from what might find in a philosophy department in Europe or North America. In general, the Continental traditions of philosophy, rather than the British analytic traditions, continue to dominate.

Lastly, and especially since the 1960s, there are individuals and groups of philosophers who have explored new provocative directions, drawing their ideas from a wide variety of sources including Western science, psychoanalysis and phenomenology as well as traditional Asian thought and medicine. This phenomenon is another example of a recurrent pattern in the history of Japanese philosophy: the assimilation and adaptation of foreign ideas against the background of an ongoing tradition.

Jaspers, Karl (1883-1969)

Karl Jaspers is generally known as an existentialist, but he also developed interesting conceptions in other fields of philosophy: in philosophy of religion, the concepts of Transcendence, cipher and philosophical faith; in philosophy of history, the thesis of an Axial Period in history; in political philosophy, the idea of a new, reasonable politics. His existentialism deals mainly with personal moral attitudes and private aspects of individual self-realization in boundary situations and intimate interpersonal communication. His political philosophy concentrates on controversial political affairs and some of the urgent problems of his age (for example, the possibility of extinguishing all life on earth by the atom bomb, or of establishing a world-wide totalitarian regime).

1 Life

Karl Jaspers studied medicine and became a psychiatrist and psychologist before turning to philosophy at the University of Heidelberg in 1920. His first major book, *Allgemeine Psychopathologie (General Psychopathology)* (1913), is a study in the methodology of psychiatry focusing on the relevance of phenomenological and hermeneutical approaches for the methods of psychopathology, while his second major book, *Psychologie der Weltanschauungen* (1919), sets forth a psychology of worldviews. This book shows clearly how much he was influenced by Immanuel Kant, Søren Kierkegaard, Friedrich Nietzsche and Max Weber. Other formative influences on his philosophy stem from Plato, Plotinus, Friedrich Hegel, Friedrich Schelling, Wilhelm Dilthey and Edmund Husserl. Jaspers' existentialism is developed extensively in the three-volume *Philosophie* published in 1932. During the Nazi regime in Germany he was denied the right to teach and forbidden to publish. In 1948 he moved from Heidelberg to Switzerland where he earned a professorship at the University of Basel. The experience of Nazi terrorism led to a break in the continuity of his philosophizing: he no longer understood his philosophy as an existential philosophy, but as one of reason, reflecting on actual political concerns. This change in Jaspers' philosophical perspective becomes evident in his major book in political philosophy, *Die Atombombe und die Zukunft des Menschen (The Atom Bomb and the Future of Man)* (1958). During this period, Jaspers also published his main works in philosophy of religion, *Der philosophische Glaube (The Perennial Scope of Philosophy)* (1948) and *Der philosophische Glaube angesichts der Offenbarung (Philosophical Faith and Revelation)* (1962) and began developing a new and original conception of world-philosophy. When he died, only a single volume of a history of world-philosophy had been published.

2 Existentialism

Jaspers' existentialism is grounded on a conception of the human being as a dual project of self-realization. Combining some ideas of Kant and Kierkegaard, he sees a human being as an empirical phenomenon and as a phenomenon with a non-empirical dimension. In the empirical dimension he distinguishes three modes of human being or self-realization: (1) vital existence or naïve vitality (*bloßes Dasein*); (2) consciousness-as-such (*Bewußtsein überhaupt*), that is, the dimension of logical thinking and rationality; (3) spirit (*Geist*), that is, the dimension of ideas which becomes manifest in personal ideals, creative conceptions of the arts, and so on. These three modes of self-realization are the empirical media for another mode which is non-empirical and non-objective, which Jaspers calls '*Existenz*'. *Existenz* is the authentic ground of human being, the intimate dimension of personal autonomy, existential freedom and true selfhood. No empirical studies or doctrines of ontology, philosophical anthropology, or ethics can give an adequate understanding of this dimension of subjectivity and humanity. Such an understanding is possible only by realizing this dimension in one's own life or by elucidating it through philosophizing.

But how can one realize one's personal autonomy and *Existenz*? Jaspers' answer is that *Existenz* cannot be planned or managed at all because it is a gift from a non-objectifiable being which he calls 'Transcendence'. Furthermore, realization of *Existenz* in specific moments of life is possible only under two conditions: first, the experience of boundary situations and, second, the experience of mutual existential communication with a partner. Boundary situations like death, suffering, struggle, and guilt cannot be overcome by using the objective and rational knowledge that helps us solve everyday problems. They require a radical change in our attitudes and common ways of thinking. In *Psychologie der Weltanschauungen* and volume 2 of *Philosophie* Jaspers presents a remarkable range of deep psychological insights into boundary situations drawn from his experience as a

psychiatrist and psychologist. He shows that many of the usual reactions to such situations prevent us from realizing our *Existenz*. The boundary situation of death, for example, can be the source of fear, anxiety and nihilistic despair, but it can also evoke the urgency of living authentically without delay and self-deception.

Jaspers distinguishes four types of communication operative in the four modes of being by which we exist. In the dimension of naïve vitality a human being lives in primitive communities with other human beings using other people only to reach vital ends. The second dimension, consciousness-as-such, is linked to a type of intellectual communication based on logical and rational categories. In the third dimension, spirit, a human being experiences communication in the close community of an 'idea of a whole', a religion, family, university, party, society, state and so on. The highest and most valuable form of communication, where the human being realizes *Existenz*, is existential communication. This is a non-objective, very intimate personal relationship between two persons, friends, lovers, a married couple, parent and child, or teacher and student. This type of communication cannot be adequately described and verbally communicated in an objectifying language. In Jaspers' subtle analyses of different reactions to boundary situations, as well as in his reflections on existential communication, a number of moral attitudes are mentioned which are highly significant for his concept of *Existenz*: courage without self-deception, composure, self-possession, dignity, fidelity, existential solidarity, responsibility, autonomy. These values constitute a specific ethos of humanity in Jaspers' existentialism (see Existentialism).

3 Metaphysics and philosophy of religion

Self-realization as *Existenz* is experienced as a gift from a transcendent source. This experience directs the subject to a dimension of being which Jaspers calls 'Transcendence', absolute being, being-as-such, God and the Encompassing. His metaphysics rejects every type of metaphysical system or speculation that aims to bridge the gap between immanence and Transcendence. The task of metaphysics is instead to appeal to every human being to 'read' the cipher-script or the 'language' of Transcendence for its own sake. A cipher is a subjective and intuitive symbol that always remains open in its meaning and functions as a signpost to Transcendence. Everything in the world is able to become a cipher. Jaspers explicitly mentions: nature, creations of the arts, metaphysical systems, myths and religions. He emphasizes the experience of foundering (*Scheitern*) as a special cipher and signpost to Transcendence.

Jaspers' philosophy of religion does not accept an objective historical revelation of God. God is hidden forever and cannot speak to us in an objectifying language through mediators. We can only be aware of Transcendence as *Existenz* in a non-objective act of cipher-'reading'. But no cipher can give any information about Transcendence beyond the horizon of historicity. It is a necessary consequence of this position that Jaspers understands Jesus as one of the 'examplary men' in human history alongside Confucius, Buddha and Socrates. Because of the paradigmatic way that Jesus realized existential possibilities, such as the ability to love and capacity for suffering, he is relevant to human beings at all times. In place of any religious faith grounded on a revelation of God, Jaspers holds out the conception of philosophical faith. This sort of faith has no objectively guaranteed proof of the existence of Transcendence and is not bound to rituals, churches, priests and theologians, who claim to be the interpreters of God's revelation. Philosophical faith is an optimistic credo involving confidence in the possibility of freedom and humanity and in the existence of a meta-empirical dimension of being (Transcendence, God, the Encompassing). It claims neither absolute certainty with respect to the possession of moral truth, nor an absolutely true knowledge of this dimension of being (see Existentialist theology).

4 Philosophy of reason and political thinking

The concept of reason became increasingly dominant in Jaspers' later philosophy. His comprehensive book, *Von der Wahrheit* (1947), is an extensive study of the dimensions of reason explicated in the context of the doctrine of the Encompassing. Reason is the bond of all modes of the Encompassing, a dynamic principle that expresses an anti-dogmatic and pluralistic intention, on the one hand, and a universalizing and communicative intention, on the other. These basic intentions of reason influenced Jaspers' political philosophy after the Second World War. During this period, he was concerned with the nature of German guilt for the rise of the Nazi movement in *Die Schuldfrage (The Question of German Guilt)* (1946), and with the problem of German reunification, as well as with global problems such as an emerging world order, the dangers of totalitarianism, the chance for worldwide communication among different nations in the face of the atom bomb and the cold war, the importance and deficiencies of the United Nations Organisation, and the necessary conditions of world peace. Reason works in this

context as a dynamic principle to prevent the dogmatization of political worldviews. It is also the task of reason to give normative impulses to traditional politics, that is, 'Realpolitik', as a means for gaining power and domination over others. Reason transfers the ethos of humanity and moral ideals characteristic of Jaspers' concept of *Existenz* from the private sphere of life to the public sphere. In this way a new reasonable politics based on moral attitudes (for example, intellectual integrity, open-mindedness, tolerance, respect for other persons, groups and people in their cultural and ethnic diversity) may help overcome the two universal political-boundary situations of the modern age: the possibility of annihilating all life on Earth with the atom bomb and the possibility of establishing a worldwide totalitarian regime.

5 Philosophy of history and history of philosophy

Jaspers' philosophy of history, which he develops in *Vom Ursprung und Ziel der Geschichte (The Origin and Goal of History)* (1949), argues for the existence of an Axial Period in history (800-200 BC). During the Axial age the basic categories of human thought, culture and religion were developed in China, India and the West. Those categories have enabled the self-understanding of mankind to continue up to the modern period. The historical consciousness of the Axial Period reminds us not only of certain cultural highlights of mankind (in China, the thoughts of Confucius and Laozi; in India, the Upanishads and Buddha; in Palestine, the prophets; in Greece, the great philosophers and tragedians), but also of the threefold origin of the culture of mankind and of the importance of pluralism in universal history. This historical consciousness provides impulses for a worldwide communication beyond all differences of creed and political opinion in our time. Jaspers' philosophy of history is nondeterministic: history is not a teleological process whereby individuals are determined by historical laws, inevitable fate, or socioeconomic mechanisms immune from human will and intention. Rather, human beings help direct the historical process through their freedom without ever being able completely to predict future tendencies by means of total planning.

For Jaspers, studying the history of philosophy entails an existential act of encounter with great human beings in the history of mankind. Great philosophers can influence life orientations and modes of thinking in all times because they make us aware of basic existential possibilities and fundamental attitudes of thinking as such. Jaspers intended to write a world history of philosophy based on five distinct approaches to the history of philosophy (historical, thematic, genetic, practical, dynamic). This project remained unfinished. During Jaspers' lifetime, only the book *Die Großen Philosophen (The Great Philosophers)* (1957) appeared; but two volumes with fragments of this immense project were published in 1981, long after his death.

Jefferson, Thomas (1743-1826)

Thomas Jefferson came from a privileged background, began his public career as a lawyer, and rose to hold the governorship of his home state of Virginia and to serve his country successively as minister to France, secretary of state, vice-president and president. His proudest declared achievements were to have been author of the Declaration of Independence, and of the Statute of Virginia for religious freedom, and founder of the University of Virginia. An architect, inventor, scientist, educator and writer, he was one of the most versatile and brilliant men of his generation. In philosophy his main contribution was to political theory, where he supported a social contract theory and a doctrine of natural rights.

1 Life

Thomas Jefferson was born on 13 April 1743 at Shadwell in Virginia, heir of a wealthy family. Educated (1760-62) at William and Mary College, he became a lawyer, served (from 1769) in the Virginia House of Burgesses, and in 1775 and 1776 in the Continental Congress. In June 1776 he was appointed head of a committee of five to prepare the Declaration of Independence, of which he was the principal author. From 1779 onwards he held a number of major political posts, including that of US minister to France (where he succeeded Benjamin Franklin in 1785), the vice-presidency of the USA from 1796 to 1800, and the presidency from 1800 to 1808.

2 Philosophical outlook

Jefferson's intellectual debts were particularly to John Locke, Isaac Newton, Dugald Stewart, Destutt de Tracy, Pierre-Jean Cabanis, and J.P. Flourens. He was a materialist whose model of reality derived from Newton, but also a deist who considered Jesus a great moral teacher but not divine. From Stewart and the Scots he absorbed the moral sense theory, but his realism owed more to the French Ideologues than the Scots (see Enlightenment, Continental).

Jefferson's philosophical contribution was in political philosophy. He was a firm believer in the social contract theory and in natural rights, which he believed were based in the biological constitution of the individual and God's benevolence in making possible the satisfaction of those needs with which individuals were created. Jefferson's view of the political order was normative rather than descriptive, but it was empirical in that it was founded on the moral sense - violations of natural rights are immediately known to be wrong. Majority rule, while essential to democracy, cannot therefore involve infringement of the natural rights of the minority. Believing that sovereignty lay undivided in the people, he thought the people could employ multiple political agents to perform their will. This led to a hierarchy of political units - individual, local, state, and Federal - on the principle that each should be responsible for those functions which it can perform alone, delegating to the larger unit those which it cannot.

Although concerned with the machinery of government and the methods of balancing the units to prevent concentration of power, Jefferson believed that structure was not enough; the success of democracy lay in the values and attributes of the people. But these in turn, he thought, were influenced by society and education. For Jefferson, a free society had to be one in which people were independent, not only politically but also economically, through the ownership of property. In the society of yeomen farmers he saw the nearest realization of his ideal of a nation of free, responsible, and moral individuals. Free elections, he believed, would result in leadership being furnished by the 'natural aristocracy' of talent and virtue, for the cultivation of which he proposed a system of public education. But Jefferson's democracy did not include blacks; although he condemned slavery, he held slaves and regarded blacks as inferior.

Jewish philosophy

Jewish philosophy is philosophical inquiry informed by the texts, traditions and experiences of the Jewish people. Its concerns range from the farthest reaches of cosmological speculation to the most intimate theatres of ethical choice and the most exigent fora of political debate. What distinguishes it as Jewish is the confidence of its practitioners that the literary catena of Jewish tradition contains insights and articulates values of lasting philosophical import. One mark of the enduring import of these ideas and values is their articulation in a variety of idioms, from the mythic and archetypal discourse of the Book of Genesis to the ethical and legislative prescriptions of the Pentateuch at large, to the admonitions of the Prophets, the juridical and allegorical midrash and dialectics of the Rabbis, and to the systematic demonstrations, flights of imagination, existential declarations and apercus of philosophers in the modern or the medieval mode.

1 The nature of Jewish philosophy

Students of Jewish philosophy, especially those who aspire to contribute a window or a wing to the edifice, must learn many languages, to read and listen to voices very different from their own. Just as the writers of the Genesis narratives or of the Pentateuch had to recast and reinvent the ancient creation myths and the ancient Babylonian laws to express the distinctively universal ethical demands and aesthetic standards of their God, and just as the Deuteronomist had to rediscover the ethical core in the original Mosaic legislation, hearing God’s commands now as urgent reminders through the very human voice of Moses, so in every generation new interpreters are needed, to rediscover what is essential and living in the tradition. Such interpreters have always needed to negotiate the rapids of historical change - not just with regard to idiom but also with regard to content, refocusing and restructuring the living tradition, sculpting it philosophically with their own moieties of reason. Such thinkers have worked always with a view to the continuity of the tradition; that is, to the faithfulness of its future to its past, but also to the vitality and vivacity of what they found timeless in the tradition and therefore capable of acquiring new meanings and new spheres of application in the present.

The confidence of the practitioners of Jewish philosophy in the conceptual vitality and continually renewed moral and spiritual relevance of the tradition is typically the reflex of an existential commitment to that tradition and to the people who are its bearers. That confidence, and its repeated vindication by the richness of the tradition itself, is also a wellspring of renewal and encouragement for the commitment that energizes it - even, and especially, in times of historical crisis and external pressures, which have rarely confined themselves to sheerly intellectual challenges. Symptomatic of that commitment is the prominence and recurrence of the philosophy of Judaism among the concerns of Jewish philosophy. However, the two should not be confused. The philosophy of Judaism is inquiry into the nature and meaning of Jewish existence. Its questions address the sense to be given to the idea of a covenant between the universal God and the people of Israel, the meaning of that people’s mission, their chosenness, their distinctive laws, customs and rituals and the relation of those norms to the more widely recognized norms of humanity, of which the Prophets of Israel were early and insistent messengers.

The philosophy of Judaism wants to understand Zionism, the Holocaust, the Jewish Diaspora and the historical vicissitudes that gave shape to Jewish experience over the millennia, from the age of the biblical patriarchs to the destruction of the first and second temples in Jerusalem, to the exile of the Jewish people and the return of many, after a hundred generations, to the land they had been promised and in which they had prospered, a land which some had never left but which most, for centuries, had pictured only through the sublimating lenses of sacred history, apocalypse and philosophy. The philosophy of Judaism wants to understand the ancient Jewish liturgy, the exegetical practices and hermeneutical standards of the Jewish exegetes. Like Freud, it wants to understand Jewish humour. Like Pico della Mirandola, it wants to understand Kabbalah, Jewish mysticism, and like Buber, it wants to understand Hasidism. The concerns of the philosophy of Judaism touch every aspect of Jewish experience, just as the concerns of philosophy at large touch every aspect of experience in general. But the concerns of Jewish philosophy, like those of general philosophy, do not confine themselves to Jewish experience. They are, in fact, the same concerns as those of general philosophy, rendered distinctively Jewish by their steady recourse to the resources of the tradition, and sustained as philosophical by an insistence on critical receptivity, responsible but creative appropriation of ideas and values that withstand the scrutiny of reason and indeed grow and give fruit in its light.

2 Strengths and weaknesses

There are two weaknesses in Jewish philosophy as practised today. One is a tendency to historicism, that is, the equivocal equation of norm with facticity and facticity with norm that leads to an abdication of philosophical engagement for a detached clinical posture or an equally unwholesome surrender of judgment to the flow of events. Historicism is a natural by-product of respect for tradition, or of expectation of progress. It becomes particularly debilitating under the pressure of positivism, whether of the logical empiricist sort that dominated philosophy for much of the early twentieth century, or of the more endemic sort that thrives on the sheer givenness of any system of law and ritual or that allows itself to be overwhelmed by the press of history itself. It is not unusual, even today, when logical positivism is widely thought to be long dead, to find scholars of Jewish thought who substitute historical descriptions for philosophical investigations, often in the process begging or slighting the key philosophical questions. Nor is it unusual among those of more traditional stamp for scholars to be found who imagine that a faithful description of the contents of authentic Jewish documents constitutes doing Jewish philosophy - as though faithfulness to the tradition were somehow a substitute for critical grappling with the issues and problems, and as though the question as to what constitutes faithfulness to the tradition, conceptually, historically, morally and spiritually, were not itself among the most crucial of those issues and problems.

The second weakness is a narrowing of the gaze, a tendency to substitute philosophy of Judaism for the wider discourse of Jewish philosophy, as though the resources of the tradition had nothing (or nothing more) to contribute to ethics, or natural theology, or metaphysics and logic, for that matter. The work of the great practitioners of Jewish philosophy has repeatedly given the lie to such narrow expectations. In every epoch of its existence, Jewish philosophy has played an active role in the philosophical conversation of humankind - which is a universal conversation precisely because and to the extent that those who take part speak every language and bring to the conversation experiences that are universal as well as those that are unique.

But if two weaknesses are to be mentioned here, at least one strength should be cited as well: Jewish philosophy, although intimately engaged throughout its history with the philosophical traditions of the West, has also been a tradition apart. The open access of most of its practitioners to the Hebrew (and Aramaic) Jewish sources has afforded a perspective that is distinctive and that can be corrective of biases found in other branchings of the tree of philosophical learning. The early access of medieval Jewish philosophers to Arabic philosophical and scientific writings, and to the Greek works preserved in Arabic, enriched and broadened their philosophical repertoire. The scholastic learning of later medieval Jewish philosophers and their collaboration with scholastic thinkers made them at once participants and observers of in the lively philosophical debates of their day. The immersion and active participation of Renaissance and Enlightenment Jewish philosophers in the movements that spawned modernity gave them a similar philosophical vantage point. All philosophers must be, to some degree, alien to their society - Socrates and Nietzsche, and for that matter even Plato, Aristotle and Descartes were, to some degree, intellectual outsiders in their own times - not so alien as to have no word or thought in common with their contemporaries, but not so well integrated as to become mere apologists, or complacent and unquestioning acquiescors in the given. Jewish philosophy has long made and continues to make a distinctive, if today underutilized, contribution to cosmopolitan philosophical discourse in this regard. It shares the problematic of Western philosophy but typically offers a distinctive slant or perspective that calls into question accepted verities and thus enhances the critical edge of philosophical work for those who study it.

3 Movements and important figures

Jewish philosophy has over the course of its history been the source of a number of different types of study based on the philosophically relevant ideas of the Hebrew Bible, Rabbinic Law (Halakhah), Rabbinic theology and Rabbinic homiletics, exegesis and hermeneutics (midrash) (see Bible, Hebrew; Halakhah; Theology, Rabbinic; Midrash). The anti-Rabbinical, biblicist movement known as Karaism and the mystical tradition of the Kabbalah are examples of differing types of movements which have emerged (see Karaism; Kabbalah), while Jewish voluntarism and Jewish Averroism were fields for the rivalry between intellectualist and less deterministic, more empiricist views of theology as it was played out among Jewish thinkers (see Voluntarism, Jewish; Averroism, Jewish). More modern movements include the Jewish pietist movement founded by Israel Baal Shem Tov and known as Hasidism, the Jewish Enlightenment movement known as the Haskalah, and Zionism, the movement that led to the establishment of the modern State of Israel (see Hasidism; Enlightenment, Jewish; Zionism).

The first exponent of Jewish philosophy was Philo of Alexandria, a major contributor to the synthesis of Stoicism, Middle Platonism and monotheistic ideas that helped forge the tradition of scriptural philosophy in the West. Other early figures include Daud al-Muqammas and Isaac Israeli, two of the first figures of medieval Jewish philosophical theology. Al-Fayyumi Saadiah Gaon (882-942), the first systematic Jewish philosopher, was also a major biblical translator and exegete, a grammarian, lexicographer and authority on Jewish religious law and ritual. The rationalism, pluralism and intellectual honesty evident in his work made it a model of Jewish philosophy for all who came after him. Solomon ibn Gabirol (*c.*1020-*c.*1057), long known as a Hebrew poet, was discovered in the nineteenth century to have been the author as well of the famous Neoplatonic philosophical work, preserved in Latin as the *Fons Vitae*. Moses ibn Ezra (*c.*1055-after 1135) is notable for his poetic and philosophic conributions. Abraham ibn Ezra (*c.*1089-1164) is likewise noted for his hermeneutical ideas and methods; his forthright approach to the Hebrew Bible was a critical influence on the thinking of Jewish philosophers from the Middle Ages to Spinoza and beyond. A less familiar figure is Abu 'l-Barakat al-Baghdadi (*fl. c.*1200-50), a brilliant Jewish thinker who converted to Islam late in life. He developed highly independent views about the nature of time, human consciousness, space, matter and motion. His work undercuts the notion that the medieval period was simply an age of faith and static commitment to a faith community.

A polymath of rather different spirit was Abraham bar Hayya in the eleventh century, who wrote on astronomy, mathematics, geography, optics and music as well as philosophy and who collaborated on scientific translations with the Christian scholar Plato of Tivoli, the transmitter of the Ptolemaic system to the Latin world. Bar Hayya's *Meditation of the Sad Soul* expresses the forlornness of human life in exile from the world of the divine, a forlornness tinged with the hope of future glory. Joseph ibn Tzaddik (d. 1149) similarly developed Neoplatonic ideas around the theme of the human being as a microcosm.

Bahya ibn Pakuda (early twelfth century) wrote as a pietist philosopher. He placed philosophical understanding and critical thinking at the core of the spiritual devotion called for by the sincerest form of piety. Judah Halevi (before 1075-1141), probably the greatest Hebrew poet after the Psalms, wrote a cogently argued philosophical dialogue best known as the *Kuzari*, but more formally titled, *A Defence and an Argument in behalf of the Abased Religion*. Set in the Khazar kingdom, whose king, historically, had converted to Judaism, the work mounts a trenchant critique of the intellectualism of the prevalent philosophical school and the spiritualizing and universalizing ascetic pietism that was its counterpart. Calling for a robust recovery of Jewish life and peoplehood in the Land of Israel, the work is not only a striking anticipation of Zionist ideas but a remarkable expression of the need to reintegrate the spiritual, intellectual, moral and physical dimensions of Jewish life.

Abraham ibn Daud (*c.*1110-80), a historian as well as a philosopher, used his historiography to argue for the providential continuity of the Jewish intellectual and religious tradition. His philosophical work laid the technical foundations that made possible the philosophical achievement of Moses Maimonides (1138-1204), the greatest of the philosophers committed to the Jewish tradition. Besides his medical writings and his extensive juridical corpus, which includes the authoritative fourteen-volume code of Jewish law, the *Mishneh Torah*, Maimonides was the author of the famous *Guide to the Perplexed*. Written in Arabic and intended for an inquirer puzzled by the apparent discrepancies between traditional Judaism and Aristotelian-Neoplatonic philosophy, the *Guide* is a paradigm in the theology of transcendence, addressing questions ranging from the overt anthropomorphism of the scriptural text to the purposes of the Mosaic legislation, to the controversy over the creation or eternity of the world, the problem of evil, and the sense that can be made of the ideas of revelation, providence, divine knowledge and human perfectibility. Like Halevi's *Kuzari* and Bahya's *Duties of the Heart*, the *Guide to the Perplexed* continues to be studied to this day by Jews and non-Jews for its philosophical insights.

Abraham ben Moses Maimonides (1186-1237), the son of the great philosopher and jurist, began his scholarly life as a defender of his father's work against the many critics who feared Maimonidean rationalism. In his mature work he became the exponent of a mystical, pietist and ascetic movement, largely influenced by Sufism. Moses Nahmanides (1194-1270), exegete, theologian and a founding figure of the Kabbalistic theosophy, championed Judaism in the infamous Barcelona Disputation of 1263 and played a leading role in the Maimonidean controversy. He struggled to harmonize his conservative and reactive tendencies with his respect for reason and the unvarnished sense of the biblical text.

Ibn Kammuna (d. 1284) was a pioneer in other areas. Besides his work in the Ishraqi or Illuminationist tradition of

theosophy, laid out in commentary on the Muslim philosopher Ibn Sina (Avicenna), he wrote a distinctively dispassionate study of comparative religions, favouring Judaism but fairly and unpolemically presenting the Christian and Muslim alternatives.

Shem Tov ibn Falaquera (*c*.1225-*c*.1295) was a warm exponent of Maimonidean rationalism and an ardent believer in the interdependence of faith and reason. His selections in Hebrew from the lost Arabic original of Ibn Gabirol's magnum opus allowed modern scholars to identify Ibn Gabirol as the Avicebrol of the surviving Latin text, the *Fons Vitae*.

Hillel ben Samuel of Verona (*c*.1220-95), physician, translator, Talmudist and philosopher was a Maimonist who introduced numerous scholastic ideas into Hebrew philosophical discourse. Immanuel of Rome (*c*.1261-before 1336) was a prolific author of philosophical poetry and exegesis, often praising reason and intellectual love. Judah ben Moses of Rome (*c*.1292-after 1330), known as Judah Romano, was an active bridge person between the Judaeo-Arabic and the scholastic tradition of philosophical theology.

Levi ben Gershom, known as Gersonides (1288-1344), was an important astronomer and mathematician as well as a biblical exegete and philosopher. His *Wars of the Lord* grappled with the problems of creation, providence, divine knowledge, human freedom and immortality. Aiming to defend his ancestral faith, Gersonides followed courageously where the argument led, often into radical and creative departures from traditional views.

Hasdai Crescas (1340-1410), an ardent defender of Judaism against Christian conversionary pressures, was among the most creative figures of Jewish philosophy, challenging many of the givens of Aristotelianism, including the idea that the cosmos must be finite in extent. Crescas' student Joseph Albo (*c*.1360-1444) sought to organize Jewish theology into an axiomatic system, in part to render Jewish thought defensible against hostile critics.

Profiat Duran (d. *c.* 1414), also known as Efodi, used his extensive understanding of Christian culture to criticize Christianity from a Jewish perspective. Deeply influenced by Moses Maimonides and Abraham ibn Ezra and by Neoplatonic and astrological ideas, he sought to balance the practical with the intellectual aspects of the Torah. Simeon ben Tzemach Duran (1361-1444) contributed an original approach to the project of Jewish dogmatics and an implicit critical examination of that project.

The Shem Tov family included four thinkers active in fifteenth century Spain (see Shem Tov family). Their works follow the persecution of 1391 and the ensuing mass apostasy of Spanish Jews and seek to rethink the relations of philosophy to Judaism. Shem Tov, the *paterfamilias*, criticized Maimonides and endorsed Kabbalah, but his sons Joseph, a court physician and auditor of royal accounts at Castile, and Isaac, a popular teacher of Aristotelian philosophy, and Joseph's son, again named Shem Tov, wrote numerous Peripatetic commentaries. These offspring charted a more moderate course that enabled Jewish intellectuals to cultivate philosophy and the kindred arts and sciences while asserting the ultimate primacy of their revealed faith.

Isaac ben Moses Arama (*c*.1420-94), like Nahmanides, was critical of Maimonidean and Aristotelian rationalism but did not discard reason, seeing in it a crucial exegetical tool and an avenue toward understanding miracles and providence. Isaac Abravanel (1437-1508), leader of the Jews whom Ferdinand and Isabella exiled from Spain in 1492, like Arama criticised Maimonidean rationalism in the interest of traditional Judaism as he saw it, but at the same time put forward a theistic vision of history and strikingly modern views about politics and the state. His son, Judah ben Isaac Abravanel, also known as Leone Ebreo (*c*.1460-*c*.1521), wrote the *Dialoghi d'amore*. Couched in the language of courtly love, the work explores the idea that love is the animating force of the cosmos. The work stands out as a brilliant dialectical exploration of the differences and complementarities of the Platonic and Aristotelian approaches to philosophy.

Judah Messer Leon (*c*.1425-*c*.1495) was a philosopher, physician, jurist, communal leader, poet and orator. Awarded a doctorate in medicine and philosophy by the Emperor Frederick III, he could confer doctoral degrees in those subjects on the students in his *yeshivah*. He saw logic as the key to harmonizing religion and philosophy and favored scholastic logic over the Arabic logical works. His encyclopedia became a popular textbook, and his systematic elicitation of Hebrew rhetoric from the biblical text, in *The Book of the Honeycomb's Flow*, one of the first Hebrew books to be printed, was a masterpiece of cross-cultural humanistic scholarship. But Messer Leon failed to curb the spread of Kabbalah, whose underlying Platonic metaphysics he abhorred and whose appropriation by Christian Platonists he held in deep suspicion. Indeed, his own son turned toward the Kabbalah

and sought to combine its teachings with the Aristotelianism favored by his father.

Yohanan ben Isaac Alemanno (1433/4-after 1503/4) brought together in his thinking Averroist, Kabbalistic, Neoplatonic and Renaissance humanist themes. He instructed Pico della Mirandola in Hebrew and in Kabbalah, bringing to birth what became a Christian, syncretic Kabbalism. Elijah Delmedigo (*c*.1460-93) was an Aristotelian and Averroist. He translated works into Latin for Pico della Mirandola and developed a subtle critique of the kabbalistic ideas that in his time were rivaling and often displacing what he saw as more disciplined philosophical thinking. Abraham Cohen de Herrera (*c*.1562-*c*.1635) was a philosophically oriented kabbalist of Spanish origin. His Spanish writings, in Latin translation, were blamed for inspiring Spinoza's views.

4 Movements and important figures (cont.)

Moses Mendelssohn (1729-86), a leading figure of the European Enlightenment, spread Enlightenment ideas to Hebrew literature, fought for Jewish civil rights and did pioneering conceptual work on political theory, especially with regard to religious liberty in his Jerusalem. Solomon Maimon (1753/4-1800) took his name in honour of Moses Maimonides. Trained as a rabbi, he pursued secular and scientific learning and became an important and original critic of the philosophy of Kant. Nachman Krochmal (1785-1840), a leader of the Jewish Enlightenment in Galicia, found anticipations of Kant, Hegel and Schelling in the ancient Jewish writings. His work shows how a thinker whose underlying assumptions differ from those of the idealist philosophers could take their views in quite a different direction from the one they chose.

Hermann Cohen (1842-1918), a major Kantian philosopher and one of the first non-baptized Jews to hold an important academic post in Germany, applied his own distinctive version of critical idealism to the understanding of Judaism as a spiritual and ethical system. Franz Rosenzweig (1886-1929), an important Hegelian thinker, went on to formulate a Jewish existential philosophy that deeply influenced many of the most prominent Jewish thinkers of the twentieth century. Martin Buber (1878-1965), Zionist advocate of accommodation with the Palestinian Arabs and an admiring student of Hasidic traditions, added his own stamp to the continental tradition of Jewish philosophy by developing a widely influential dialogical philosophy that privileged relationships experientially and celebrated the I-thou, a mode of relation that allows for authentic encounter.

A number of twentieth century philosophers of Judaism have grasped at diverse threads of the Jewish experience, illustrating both the attractions of the tradition and the fragmentation produced by centuries of persecution that would culminate in the Holocaust, only to be accentuated by the centrifugal tendencies of Jewish life in post-Holocaust liberal societies. Ahad Ha'Am, the pen name of Asher Ginzberg (1856-1927), was an essayist who argued that the creation of a 'spiritual centre' of Jewish culture in Palestine would provide the sustenance needed to preserve the diaspora Jewry from the threat of assimilation. No state was needed. David Baumgardt (1890-1963) was a philosopher who sought to reconcile ethical naturalism with the ideals he found in the Jewish sources, but, unlike Hermann Cohen, Baumgardt did not explore those sources in close detail. Mordecai Kaplan (1881-1981) sought to devise a social mission and communal identity for Jews without reliance on many of the core beliefs and practices that had shaped that identity in the past. Abraham Joshua Heschel (1907-72) sought to salvage the spiritual dimensions of Jewish experience, which found expression both in ritual and in ethical and social action. Joseph Soloveitchik (1903-93) gave canonical expression to Orthodox ideals by focusing on the intellectual and ritual rigours of his archetypal figures, Halakhic man and the Lonely Man of Faith. Yeshayahu Leibowitz (1903-94), an influential Israeli thinker, struggled for the disengagement of authentic and committed religious observance from the toils of governmental officialdom. Jews are mandated, he argued, to observance, as a community. That imperative is not to be put aside. Neither can the observant pretend to ignore the State of Israel. But the State can give no mandate to religious observance, and religious faithfulness can impart none of its aura to the State. For it is essential not to place God in the service of politics. Emil Fackenheim (1916-) seeks an authentic response to the Holocaust, which he formulates in an intentionally inclusionary way, as a '614th' commandment, not to hand Hitler a posthumous victory but to find some way, that might vary from individual to individual, of keeping alive Jewish ideas, practices and commitments.

L.E. GOODMAN

Jewish philosophy in the early 19th century

Although Jewish philosophy flourished in the Middle Ages, it underwent a serious decline in 1492, when the Jews were expelled from Spain. The period following Kant and Mendelssohn witnessed an attempt to reintegrate Jewish philosophy into the mainstream of Western culture. The strategy of reintegration consisted of two elements: (1) showing that there is more to Judaism than the study of Scripture and (2) arguing that some of the ideas that won favour in the Enlightenment were anticipated by Jews centuries earlier.

The most central idea that Jewish thinkers claimed as their own is a shift in focus from theoretical issues to practical ones. As important features of the medieval worldview fell into disrepute, many philosophers began to ask whether there are limits to what human reason can know. Can it really prove that God exists or that the soul is immortal? One response was to argue that even if no proof can be found, there are still grounds for believing, particularly if our understanding of ourselves as moral agents makes no sense without them.

But it did not take long for people to argue that moral agency requires not just a God but a free and transcendent God capable of issuing commands to free agents created in the divine image. Here too, Jewish thinkers claimed that the idea of a God who is not limited by nature and insists on mercy and justice for all people was an integral part of monotheism as understood by the Hebrew prophets.

1 The legacy of Mendelssohn and Kant

It is generally agreed that Jewish Emancipation and modern Jewish philosophy began with Moses Mendelssohn. A product of, and participant in, the Enlightenment, Mendelssohn saw no incompatibility between his commitment to Judaism and his integration into modern European society (see Enlightenment, Continental). According to Mendelssohn (1783), the truths on which religion is based - the existence of God, divine providence, and the immortality of the soul - can be grasped by all people through the aid of reason. Since these truths are required for the pursuit of happiness, revelation is not only unnecessary but unjustifiable. Why would God reveal the secrets of happiness to one nation and leave the rest of humanity in the dark? Thus Mendelssohn recognizes no eternal truths other than those comprehensible to human reason and capable of being verified by it. With respect to Judaism, Mendelssohn points out that the Torah contains no commandment that says ‘Thou shalt believe…’. Rather than articles of faith, Judaism is based on revealed legislation. Although this legislation presupposes truths accessible to all humanity, the only thing incumbent on Jews alone is a system of behaviour.

Mendelssohn’s stress on the practical nature of Jewish spirituality bears a strong resemblance to the critical philosophy of Immanuel Kant. While Kant is often credited with the destruction of metaphysics, it would be more accurate to say that he attempts to move metaphysical ideas from a theoretical context to a practical one. Though reason cannot prove the existence of God, the immortality of the soul, or personal freedom, we must presuppose these foundational ideas if we are to make sense of our duties under the moral law. The result is that our idea of God is not a ‘demonstrated dogma’ but a necessary postulate. As Kant says in the introduction to the *Kritik der Reinen Vernunft (Critique of Pure Reason)*, his intention is to limit knowledge in order to make room for faith (*Glaube*).

Not surprisingly, Kant concludes that the only content we can ascribe to our idea of God is moral. Even if we could prove that a necessary Being exists, we could not get a satisfactory idea of divinity because the crux of that idea is the notion of a perfect or holy will. It could be said, therefore, that Kant’s view of God is much closer to the prophetic model of a judge and law-giver than it is to the idea of a first cause. This is important because scientific speculation is not indigenous to Judaism. The prophets sought God not by reasoning from effect to cause but by trying to awaken people’s conviction that the world could be better and that it is our obligation to make it so. In short, they sought God in ideas like commandment and repentance, both of which play a central role in Kant’s understanding of morality.

Kant argues for an idealized form of Christianity, which is to say a religion which recognizes all moral duties as divine commands. Looking beyond sectarian quarrels, he stresses the importance of trying to overcome the propensity of the human heart to do evil. Religion becomes spurious when people believe they can please God in ways that do nothing to improve behaviour, that simply wearing the right clothes or performing the right ritual is

more important than purifying one's motives. Kant's picture of a religion that rejects intolerance and dogmatic pronouncements could not help but appeal to Jews, even though Kant himself did not think much of Judaism as a religion. Yet Kant's attempt to formulate an idealized form of Christianity raised the question of whether the same could be done for Judaism.

2 S.D. Luzzatto (1800-65)

Luzzatto agrees with Mendelssohn that Judaism is not based on articles of faith but carries this conclusion much further. Sharply critical of the medieval philosophers who tried to justify the principles of Judaism with rational arguments, Luzzatto argues that metaphysics is impossible and trust in human reason, unfounded. In fact, the whole attempt to view Judaism as a source of truth about God is characteristic of what Luzzatto terms 'Atticism'. In his view, Greek ethics was an attempt to achieve happiness through wisdom. But experience shows that the Greek view of human behaviour is fundamentally flawed: intelligence alone will not yield lasting wellbeing or cure human ills. Luzzatto therefore proposes that we understand wisdom not as contemplation of abstract truths but as a condition in which people act with care and thoughtfulness, trusting in the saving grace of God (see Grace).

The positive side of Luzzatto's thought is his emphasis on compassion. All that is abiding in human life is the joy of performing acts of kindness and love, putting aside self-interest to help others. In Luzzatto's view (1880), these emotions, ignored by rationalist philosophers, permeate every aspect of the legislation of the Torah. In the days of Abraham, Isaac and Jacob, Luzzatto claims, religion was not enforced by a system of rewards and punishments. People understood the difference between right and wrong and invariably chose the former. Without proofs or arguments, they believed in God and worshipped in a natural, self-initiated fashion. It was only when the Israelites became a nation and began to mix with other nations that they needed the laws, rituals and educational imperatives revealed to Moses. Thus Judaism is autonomous before and heteronomous after Sinai.

Luzzatto's scepticism about human reason goes well beyond anything found in Mendelssohn and Kant. In fact, his emphasis on moral emotions and natural religion is suggestive of Rousseau. Although his influence was not nearly as great as Mendelssohn's, Luzzatto was one of the first Jewish thinkers to break with medieval Jewish rationalism.

3 Moritz Lazarus (1824-1903)

Closer in spirit to Mendelssohn and Kant is the thought of Moritz Lazarus. In a two volume work entitled *Die Ethik des Judentums (The Ethics of Judaism)* (1901), he argues that the Bible does not expound dogmatic teachings about the nature of God. Obedience to God is not based on omnipotence or omnipresence but on God's moral perfection. God commands an act because it is right; it is not right because God commands it. It is not God's command but its own moral necessity that makes a law binding. 'Law' and 'morality' here mean Kant's categorical imperative. In Lazarus' view, this principle underlies all the commandments, sayings and moral insights scattered through the Torah and Talmud.

Lazarus argues that Judaism is committed to the autonomy of the moral subject. When Kant says that morally we are subject only to a law of which we can regard ourselves as author, the point is not that we have created the law ourselves but that our moral self recognizes and accepts the validity of the law. God may be the one who gives the law, but it is the recognition of its validity that determines its moral character. Sanctification, as Lazarus says several times, is moralization. Not surprisingly, Lazarus goes to great length to stress the universal features of Jewish law. All people are created by God and formed in the image of God. Thus the Bible commands the Israelite to 'love thy neighbour as thyself' (Leviticus 19: 18) and to ensure that there is 'one law for you and for the stranger in your midst' (Leviticus 24: 22; Numbers 15: 15). The election of Israel has nothing to do with blood or moral superiority but with the fact that Israel was commanded to follow a universal moral law.

Book Two of *Die Ethik des Judentums* is mainly a study of the psychological foundations of Jewish ethics. The purpose of ethics is not to negate human nature and promote asceticism but to assign boundaries to the various instincts clamouring for satisfaction and to harmonize the opposing claims that arise in social intercourse. Lazarus maintains that Jewish teachings foster sympathy, charity and love of one's fellow human beings. His focus on the psychological foundation of Jewish ethics is both the strong point and the weak point of his system. The strong point, because he sheds considerable light on Jewish ritual: each practice either curbs an instinct or fosters a virtue

(see Ritual). The weak point, because Kantian ethics is supposed to be based on the objective necessity of the moral law, not on the feelings it engenders or the social harmony it promotes.

4 Solomon Ludwig Steinheim (1789-1866)

A very different reaction to Kantian philosophy can be found in the thought of Solomon Ludwig Steinheim, whose major work, *Die Offenbarung nach dem Lehrbegriffe der Synagoge (Revelation according to the Doctrine of the Synagogue)* (1835), is a critique of all attempts to justify religion with arguments derived from philosophy. The crux of Steinheim's argument is that it would be silly and superfluous for God to reveal a doctrine that we are capable of discovering on our own. Steinheim therefore rejects scholastic attempts to argue that reason and revelation are alternative ways of arriving at the same truth. This does not mean that the contents of revelation are secret, ineffable, or unfathomable. On the contrary, Steinheim insists that revelation offers us a doctrine that is both communicable and comprehensible. His point is that it must give us something new, something beyond what our reason, conscience, or feelings already provide.

By 'revelation', Steinheim means a historical event, not an evolutionary process or rational discovery (see Revelation). Although our understanding of revelation may change and grow over time, the contents do not. Revelation is needed because reason cannot free itself from antinomies regarding freedom and necessity. Reason conceives of the world according to necessary connections. Whether God is understood as the first member of a causal chain or as a being whose essence implies existence, it is still true that the God of reason must submit to the rule of necessity. According to Steinheim, this means that the God of reason is not a free and spontaneous agent who creates the world but a mechanical force that resides within it. The problem is that reason has no choice but to uphold the principle *ex nihilo nihil fit*, from nothing comes nothing. If this principle is true, every event must be preceded by a cause. It follows that reason cannot conceive of anything that is spontaneous, least of all a creation that is genuinely *ex nihilo*. The only creation it can subsume under causal laws is the ordering of an eternal, formless matter. But, in Steinheim's opinion, this sort of creation is no creation at all. So reason cannot account for the existence of the world in time.

What is true of creation is also true of human action. If every event must be preceded by a cause, individual moral responsibility is impossible. Like creation, the initiation of action requires spontaneity, a coming into being from nothing. Freedom is an undeniable fact, the basis of all ethical judgments. But without the teaching of revelation, this fact also would be simply an event without a cause.

In Steinheim's view, we have no choice but to admit the superiority of revelation: that is, a creating God, human agents made in the image of God, and the immortality of the soul. Although Steinheim is sometimes read in light of Kierkegaard, the comparison is wide of the mark. We do not give up reason in order to embrace absurdity but go beyond reason in order to avoid determinism. Note, however, that Steinheim's view of the contents of revelation corresponds to Kant's idea of the postulates of pure practical reason. So while Steinheim may be right in saying that reason, understood as a faculty that moves from cause to effect, cannot account for spontaneity, it does not follow that we have no choice but to affirm revelation as a historical fact. The Kantian retort is that reason also has a practical employment compatible with freedom.

5 Solomon Formstecher (1808-89)

If the thought of Lazarus and Steinheim is a reflection on Kant, that of Formstecher is a reflection on Hegel and Schelling. In *Die Religion des Geistes (The Religion of Spirit)* (1841), Formstecher emphasizes that Judaism is based not on the apprehension of timeless truths given to Moses but on an evolving conception of spirit that achieves greater clarity over time.

Formstecher's philosophy begins with the idea of a world soul (*pneumatikon*) that manifests itself either as spirit or as nature. The world soul is a unity that underlies the world and exists independently in the sense that the world soul could exist without the world but not vice versa. Formstecher insists, however, that the world is not created by a necessary causal process but by free choice. Put otherwise, God, the bearer of the world soul, is a free, self-conscious, self-determining entity, separate from the world but responsible for its existence. Formstecher thus rejects any form of pantheism. Of the two spheres of reality, only spirit is conscious both of itself and of nature. Thus the world soul can be conceived only under the guise of spirit.

The duality of nature and spirit gives rise to two forms of religion: one based on necessity, the other on freedom. Formstecher identifies the first type with paganism; the second, with Judaism. Paganism deifies nature by worshipping objects within it or identifying God with the forces that control it. The outgrowth of paganism is detached contemplation of the beauty of nature and the attempt to decipher its secrets. But a religion of spirit stresses freedom over necessity and goodness over beauty. It is here that knowledge becomes more than awareness of an external object and attains self-consciousness in the true sense. The essence of Judaism is ethical monotheism: God stands apart from nature, and our purpose in life is not to achieve unity with God but to emulate God's ways by striving for the moral ideal.

Formstecher treats revelation not as a single event but as the process by which spirit becomes aware of itself. A liberal, he looks forward to the day when Judaism will de-emphasize ritual and stake its claim on greater understanding of the process of spiritual development. In Formstecher's view, Christianity is an attempt to bring the religion of spirit to the nations of the world. But where Hegel saw the doctrine of incarnation as an attempt to bridge the gap between an infinite creator and finite creation, Formstecher sees it as a concession to paganism.

6 Samuel Hirsch (1815-89)

Like Formstecher, Hirsch interpreted the history of religion in terms of the historical development of spirit. His major work, *Die Religionsphilosophie der Juden (The Religious Philosophy of the Jews)* (1842), argues that while European society has begun to tolerate Jews, it has failed to recognize the unique contribution of Judaism to world culture. Thus Kant did not regard Judaism as a religion at all, and Hegel thought of it as an inferior religion superseded by Christianity.

At the root of Hirsch's philosophy is the act of self-consciousness or recognition of the self as an 'I'. It is in this act that we separate ourselves from nature and come to experience freedom. But, being abstract, this freedom is empty. Religious life is the process by which true freedom is realized. For freedom to become concrete, it must acquire content by facing the choice between real freedom, which implies virtue, and illusory freedom, which implies sin (see Freedom and liberty).

According to Hirsch, freedom is experienced as a gift, so there must be a divine dispenser of freedom who is absolutely free. Humans are the image of God, and history is the human quest for perfect freedom. Hirsch took strong exception to the Pauline doctrine of original sin, on the grounds that it compromises the idea of freedom. I am not guilty of sin until I exercise my own free choice (see Sin). Like Formstecher, Hirsch sees Christianity as an attempt to bring the truth about God to the nations of the world. But, unlike Formstecher, he does not argue for the inherent superiority of Judaism. In his view, both religions are evolving and will reach their perfect or absolute state in the days of the Messiah. With respect to Judaism, Hirsch played a decisive role in the founding of the Reform movement.

7 Conclusion

Despite their differences, all the philosophers discussed in this article tried to integrate Judaism into Western culture or what Formstecher called 'the universal religion of civilized people'. All stress the importance of human freedom, the need to undertake moral action, and the existence of a transcendent God. As the nineteenth century drew to a close, the influence of Hegel began to wane and rationalist thinkers returned to Kant. After the First World War, the primary debate in Jewish philosophy became that between Kantians like Hermann Cohen and existentialists like Martin Buber and Franz Rosenzweig.

Jewish philosophy, contemporary

Jewish philosophy is pursued by committed Jews seeking to understand Judaism and the world in one another's light. In this broad sense, contemporary Jewish philosophy maintains the central focus of classical, medieval and Enlightenment Jewish philosophy. But a certain kind of traditionalism distinguishes many contemporary Jewish philosophers from their predecessors: an effort to show how Judaism maintains continuity and coherence despite historical change. Jewish thinkers who are traditionalists in this sense are no longer preoccupied with showing non-Jewish philosophers how Judaism fares when evaluated by universal reason, as their classical, medieval and modern predecessors were. Nor is their chief concern with exhibiting the good reasons for remaining Jewish and not converting to Christianity or Islam, as was that of many earlier Jewish thinkers. One work that sets an agenda for many of these traditionalists is Franz Rosenzweig's Der Stern der Erlösung (The Star of Redemption) (1921). Like Rosenzweig, (1) they often reject the Enlightenment demand for a transcendental propaedeutic as a prelude to asking substantive questions. Instead, they address Jewish thought, ethics and experience head on. (2) None among this group thinks of his work as beholden primarily and inevitably to standards of thought articulated first and foremost outside distinctively Jewish experience. (3) The six points of Der Stern der Erlösung (The Star of Redemption) - Creation, Revelation, Redemption, God, Israel, and the World - mark the large themes they aim to define or the categories through which they propose, explore and defend their claims. Besides traditionalism thus understood, contemporary Jewish philosophy, particularly among philosophers with analytic training, is marked by efforts philosophically to reanimate the classic texts of medieval Jewish philosophy, especially the work of Moses Maimonides.

1 Classical and medieval background

What counts as contemporary Jewish philosophy? Posing the question historically is virtually inevitable, because the discipline recurrently contends with its own past. Locating Jewish philosophy in the context of classical and medieval thought seems relatively easy, especially with the aid of hindsight: We might describe such philosophy as a reasoned and disciplined investigation by committed Jews of humankind-in-God's-world, or as their search 'for the deepest truth the world has to offer' (Novak 1995: 6). Typically, the philosophers engage extensively with traditional Jewish texts, especially the Hebrew Scriptures and Talmud. Philo of Alexandria, Al-Fayyumi Saadiah Gaon, Judah Halevi and Moses Maimonides are salient examples.

For most classical and medieval Jewish philosophers, the confluence of Jewish with non-Jewish sources - for example, Plato and Aristotle - is decisive. Thus Jewish philosophy is syncretistic all the way down. With the destruction of an independent Jewish state and the emergence of the cosmopolitan imperial cultures in which the key figures of classical and medieval Jewish philosophy typically wrote, a central question motivating many Jewish philosophers well versed in the philosophical canon of the cosmopolitan culture was this: how can learned and reasoning people embrace the claims that Jewish texts seem to make? A tension was all but inevitable between views rooted in Jewish history and tradition and what non-Jewish philosophers typically saw and presented as universal truths. Are Jewish claims about humankind-in-the-world compatible with, even deducible from, the principles and claims of universal reason, as articulated, say, in the Graeco-Roman philosophical tradition?

2 Modern background

Classical and medieval Jewish philosophers, living in cosmopolitan Alexandria, in Muslim-governed countries, or the ghettoes of Catholic Europe, saw themselves as free to pursue their basic questions in ways that allowed them to live, act and think openly as Jews. Their concerns over possible tensions between particularity and universality persist into the modern period. But the writing of many modern thinkers takes a new turn, under the threat of a Protestant theocracy, as in the case of Spinoza, or under what might be called the tyranny of liberal Protestant civility, as with Mendelssohn, Cohen, Rosenzweig, Buber and others.

Responding to his intellectual and spiritual environment, Spinoza treated both Judaism and Christianity as significant, but human, cultural constructions with no privileged authority *vis-à-vis* the universe. He could thus lay conceptual foundations for a liberal republic welcoming to a plurality of reasonable religions that would benefit the public welfare by inculcating moral constraints and, as Jefferson would later put it, 'neither pick [our] pocket[s] nor break [our] leg[s]'.

Much influenced by Spinoza, Mendelssohn (1783) shared a liberal, republican agenda with many of the Protestant thinkers of his day. But he could not share a vision of grace and law that is so heavily laden as theirs often is with ancient anti-Hebraic grudges and disparaging misreadings of Judaism. He had to rebuff his Protestant admirers when they urged him, in the name of his own philosophy, to abandon Judaism for Christianity. He demanded separation of church and state and dismissed claims to political control over the human mind and spirit. Jewish life and thought, he argued, are compatible with universal reason and at least as conducive to liberal republican polity and culture as Christianity. But they depend necessarily on freedom of conscience.

Cohen went a step further. In *Die Religion der Vernunft aus den Quellen des Judentums (Religion of Reason out of the Sources of Judaism)* (1919) he argues that Judaism, more than other religious options, offers the morality, piety and spirituality that a thinking, liberal person requires. Buber's *Ich und Du (I and Thou)* (1923) similarly celebrates the Jewish covenant as central to the universal values of human life at its best. He actually dismisses any vestige of Jewish law, so as to render Judaism a paradigm of the 'grace-ful' existential attitude that is conducive to a liberal democratic community, open to divinity - the ultimate Thou - and capable of thriving among the nations (see Buber, M.).

Franz Rosenzweig was at first attracted to liberal Protestantism but ultimately rejected its blandishments. He turned the tables on Buber's Jewish existentialism, arguing for a religious philosophy that renders any and every humanism, including every kind of liberal or socialist doctrine, dependent on a prior theology. The core of this theology is the conception of God's word, embodied eternally, outside the historical life of the nations, by the Jewish people, even as it is embodied historically in the Christian Church(es) and their militant quest for peace and understanding among the nations.

Rosenzweig presents himself as a *ba'al teshuvah*, a penitent returning to Judaism from the theologically liberal tradition that runs from Spinoza through Mendelssohn to his own teacher, Hermann Cohen. Rosenzweig's stance as a returning Jew is crucial in understanding contemporary Jewish philosophy. At least for many paradigm cases, a similar attitude of return sets the tone and orients much of the programme - certainly for Fackenheim (1973, 1982), Levinas (1969, 1990), Novak (1995) and Wyschogrod (1983). How is this so?

3 Characteristics of contemporary Jewish philosophy

First, philosophers as diverse as Fackenheim, Hartman, Leibowitz, Levinas, Soloveitchik and Wyschogrod have learned the lesson Rosenzweig taught: that it is possible to drop the Kantian (or Lockean) transcendentalist demand for a philosophical propaedeutic before first-order questions can be asked. None of them takes the transcendental turn before turning to traditional religious issues - as Rosenzweig himself still did in Part One of *Der Stern der Erlösung* (1921), seeking to refute, not simply reject, transcendentalism. None of these figures asks such Lockean or Kantian questions as 'What are the conditions for the possibility of thought, language, knowledge, science, ethics, or experience' in general, or of religious thought, language, knowledge, ethics, or experience in particular (see Locke, J.; Kant, I.)? Rather, each investigates Jewish thought, ethics and experience head on, asking in particular the following questions. How good are these things? How can they help us shape our lives? What resources do they give us to conceptualize problems of meaning that threaten our human capacity to endure or triumph, physically, cognitively, morally, in the face and wake of suffering, absurdity and evil? How do they fare when compared with challengers or competitors, opposers, or nay-sayers? Perhaps most often addressed is this question: how did Enlightenment philosophy thin out the rich tradition of Judaism that once gave Jews conceptual and practical tools for understanding and acquitting themselves with grace, mercy and justice in God's vexed and vexing world? Even more significantly, how can Jewish thought, ethics, and experience be restored to their cultural, social and personal thickness, their traditional complexity, profundity and open-ended creative dynamic?

These preoccupations mark many contemporary Jewish philosophers as traditionalists in the sense that they are seeking, as William James might have put it, 'a minimum of jolt and a maximum of continuity' in Jewish ways of thinking and living. As David Novak puts it in his own case (1995), they embrace a traditionalism that tends to avoid both historicism and fundamentalism, two orientations that had already rejected the Enlightenment project. Historicism, as they see it, undercuts the coherence of Jewish tradition by rendering it into discrete, ultimately incommensurable epochal, or time-sliced, cultures. Fundamentalism, by contrast, assumes too much invariance in

the tradition. It transforms Jewish continuity and coherence into a monolith and blunts its vital and vibrant diversity - just as what we might call Enlightenment fundamentalism assumed too much invariance in rationality.

Historicists are left with many Judaisms but no tradition. Fundamentalists are left with a purportedly essential Jewish tradition that lacks historical dynamic or nuance. Traditionalists, seeking a way between this Scylla and Charybdis, contend that the task for a living Jewish philosophy is to discover how Judaism maintains continuity and coherence through all the vicissitudes it has suffered and all the changes it has undergone - not merely despite them. This approach, they claim, reflects the open-textured character of Judaism; it also permits a full-fledged philosophy of Judaism and clarifies Judaism's contributions to philosophy at large.

If this characterization of such thinkers as Fackenheim, Hartman, Leibowitz, Novak, Soloveitchik and Wyschogrod makes sense, a second Rosenzweigian characteristic of their work readily comes into view: None among these contemporary traditionalists thinks of his work as beholden, primarily or inevitably, to standards of thought and action articulated first and foremost outside distinctively Jewish experience. To be sure, like Rosenzweig, each learns from mentors and gleans arguments where or when he finds them; and, like him, some, at least, will be much concerned with relations between Judaism and Christianity - although none will adopt Rosenzweig's duplex theology, dividing the work of true religion between Jewish spirituality and Christian worldliness. There is no sense among them that Jewish ideas, as such, must be checked for their validity, as a matter of sound principle, against any purportedly universal philosophical standard, whether Greek, Cartesian, Kantian, Hegelian, or existentialist. They abandon any variety of Enlightenment fundamentalism. This marks a departure from the practice of Jewish philosophers from Philo to Buber. Indeed, much of the Jewish philosophical writing of these contemporary traditionalists reflects on and continues the work of Jewish sources, often using commentary with a marked family resemblance to Jewish midrashic and *aggadic* discourse.

Third, as we have suggested, for these traditionalists, Rosenzweig's *Der Stern der Erlösung* outlines the basic points of concern. The six points of this work - (1) Creation, (2) a Revealed Covenant for an elect People, (3) the promise of Redemption, (4) God as the Creator and Revealer of Covenant, (5) Israel as God's Elect and (6) the World as the beneficiary of God's Promise of Redemption - mark out the ground they aim to defend and provide the categories through which they explore, discover and urge their claims.

Fourth, and linked with this agenda, if this group shares *bêtes noires*, they are thinkers who despoil or reject any of the above six points. Thus, perhaps no *bête* is more *noire* than Spinoza (see Fackenheim 1982; Hartman 1985; Levinas 1969; Novak 1995). Spinoza here is the great and baleful alternative to Rosenzweig's return. He is the classic renegade who abandons Judaism and rejects its deepest truths. And he is the father of academic anti-Hebraism, the watershed figure who teaches the likes of Kant and Hegel to portray Judaism as spiritually crippled, fanatically nationalistic, and superstitiously, slavishly loyal to 'the Law'.

For the contemporary traditionalists, Spinoza was the first and perhaps most challenging philosopher to attempt a complete dismantling of transcendence; he directly attacks all six points of *Der Stern der Erlösung*. Where Judaism contends that we live in a created world, Spinoza argued that the idea of creation explains nothing. Where Judaism contends that the world is governed by a God who especially cares for humankind and reveals that care in the covenant by which he elects the people Israel, Spinoza maintained that the world is explainable through natural principles that relate only randomly to human wish and will (see Fackenheim 1982; Hartman 1985). For Spinoza, although everything is grounded in divine power, God has no particular role in establishing the Hebrew covenant. The Hebrews legislated that covenant for their own local purposes, in essence electing God (see Novak 1995). Where Judaism finds in God's world profound reasons for hope or the expectation of redemption, since God, in cooperation with Israel and all humankind, works to realize, in due time, the good life and the establishment of his kingdom, Spinoza seems to picture humankind as an incident within and among the many incidents of a self-perpetuating and unending process, a motiveless but all-encompassing system of physical or natural cause and effect (see Fackenheim 1982; Hartman 1985; Levinas 1969; Soloveitchik 1944).

Finally, like Rosenzweig, the modern traditionalists turn the tables on the mainly Protestant liberal philosophical theologies that emerged in the intellectual and cultural wakes made by Kant and Hegel: Paradigmatically, they reject the anthropologizing of religion they find apparent in Kant's *Die Religion innerhalb der Grenzen der blossen Vernunft (Religion within the Limits of Reason Alone)* (see Kant, I. §14) (see Fackenheim 1973; Hartman 1985; Leibowitz 1992; Novak 1985; Soloveitchik 1944; Wyschogrod 1983). Parallel with neo-orthodox Protestant

thinkers like Karl Barth, they are confident of reaching perfectly reasonable religious decisions and conclusions out of unabashedly covenantal sources and theocentric lines of thinking (for parallels with Barth, see Novak 1985 and Wyschogrod 1983). As part of this aspect of their 'return', they reject Kant's insistence on the self-legislation - and in that sense, autonomy - of ethics, attempting to restore what might be described as Micah's view, that justice and mercy towards the neighbour and stranger are grounded in the humble love of God and are virtually inseparable from it (see Fackenheim 1973, 1982; Levinas 1969).

Naturally, they find in Kant's academic anti-Hebraism an unappreciative and distorted reading of Jewish sources that reduces the mutuality of the covenant to tyrannical legalism and that caricatures the *mitzvot* as onerous and alienating obedience (see Fackenheim 1973; Soloveitchik 1944). They reject the Protestant/Hegelian triumphalist history-of-religions narratives at work in liberal theology, the Hegelian presumption picked up by such writers as Otto, Wach, and Eliade, that irreversible, unidirectional progress from religious particularism to religious universalism (of a decisively Christian incarnational kind) is either somehow historically inevitable or normatively optimal for genuinely religious people or peoples (again, see Fackenheim 1973, but also Soloveitchik 1944).

The contemporary traditionalists barely bother to contend any longer with Enlightenment attacks on transcendence or demands for epistemological or metaphysical propaedeutics. The theological liberalisms that emerged out of the German Enlightenment, which reduced full-bodied - and fully bodied - Jewish tradition to some thin, vague, relatively nondescript and typically secularized confession are hardly engaged, even as straw men. The single issue emerging from the German Enlightenment that still divides traditionalists is that of religious pluralism (see Religious pluralism). Some, like Fackenheim, Hartman and Novak, construe an appreciation for other religious traditions as a kind of moral, social, or intellectual requirement. Others, like Soloveitchik, find such appreciations tangential to *halakhic* life. Still others, like Leibowitz, find such pluralism actually beside the point, covenantally speaking.

Most exponents of contemporary traditionalism find four episodes in twentieth-century Jewish history decisive in the emergence of their outlook: the Nazi destruction of European Jewry, the wartime abandonment of the Jews by the North Atlantic democracies, the re-establishment of the State of Israel in the wake of the Second World War, and the disaffection of increasing numbers of American Jews from traditional Jewish life, in response to the attractions of secular affluence and assimilation. These events locate Jewish philosophy socially and culturally in a context vastly different from that of its classical, medieval, or Enlightenment counterparts. They seem to render almost irrelevant the particularist/universalist, faith/reason problematics of the medievals and the more distinctively modern challenges of liberal Christian civility. It is widely supposed that if the First World War did not render the German Enlightenment tradition quaint, then surely the Third Reich's Final Solution and the moral abdication of the North Atlantic republics exposed in its implementation a depth of hypocrisy that soured the entire enterprise (see Holocaust, the).

Liberal, secular and assimilationist paths seem to many clearly to spell the extinction of the ancient tradition. And many, especially in the United States, suppose that cultural Zionism, or a diaspora sensibility centred on Israel can alone render appealing the commitments of Jewish traditional life (see Zionism). But these assumptions are highly debatable, if rarely argued pro or con with much rigour. In fact, Jewish philosophers, like virtually all other philosophers as the century ends, have barely begun to come to grips with the profound events affecting Jewish life throughout the twentieth century.

4 Contemporary problems and prospects

Many characteristics of contemporary traditionalism reflect the course philosophy itself has taken, especially in western Europe, notably, with the emergence of existential, phenomenological, hermeneutic, Marxist, feminist and other cultural critiques of the Enlightenment. The works of Fackenheim, Levinas, Soloveitchik, Wyschogrod and others must be read in this context. So too must Israelis like Halbertal and Margalit 1992), who address traditional Jewish concepts like idolatry and worship in analytically and phenomenologically rigorous ways. Here, too, we have philosophers abandoning the Enlightenment thinning of tradition and reduction of religion to, say, the presumptive categories of science (error and accuracy), ethics (duties and inclinations), and aesthetics (appropriateness and inappropriateness). For many of the new traditionalists, authenticity means giving a full-blooded religious culture an honest and appreciative hearing in something like its own terms.

Paralleling the Continental developments, English-speaking philosophers, especially Wittgensteinians, and analytic pragmatists like Quine, Sellars, Davidson, Putnam and Rorty, have subjected basic Enlightenment assumptions (such as that about 'the given' or 'the very idea of a conceptual scheme') and distinctions (such as those between analytic and synthetic judgments, or between things and phenomena) to severe criticism. Many of the English-speaking philosophers have themselves essayed what might be construed as forms of traditionalism. But no contemporary Jewish philosopher has attempted to construct a Wittgensteinian philosophy of Judaism, and virtually none has come to grips with the pragmatists - despite Harry Austryn Wolfson's pronouncement (1912) that the tangles between the Halevian and Maimonidean approaches in philosophy prefigure what Wolfson considered the major philosophical debate of his time (which surely overlaps with ours): the debate between pragmatism and eternalism - or what we might now call realism.

Among English-speaking religious philosophers, the vacuum left by the collapse of modern Enlightenment projects has been filled largely by analytically trained thinkers, many of whom study classical, medieval, or scholastic texts and issues. Here an asymmetry must be noted between the works of Christian and those of Jewish philosophers. Christian philosophers like Alvin Plantinga, William Alston, or James Ross engage in historical studies of Christian scholasticism (broadly construed) but go on to converse about various issues in the wider Christian intellectual community, and finally to contribute variations on scholastic Christian arguments to current epistemological, semantic and metaphysical debate. Analogous Jewish philosophers, by and large, have not followed suit. Unlike their traditionalist Jewish peers, most have focused on reorienting and reanimating the history of medieval Jewish philosophy itself, especially as represented in the work of Moses Maimonides, treating his thought with the philosophical sophistication it deserves and opening up avenues for renewed philosophical engagement with it. Such engagement may both reflect and stimulate a constructive turn in Jewish philosophy that is more appreciative of the role of (a restrained, chastened, or more epistemically catholic) reason in religious thought and more sanguine about the light it can shed on Judaism and on the world - witness the recent ambitious work by Lenn Goodman (1991, 1996). Still it remains true that few have yet sought to help revitalize or heighten the tenor of intellectual concern and philosophical conversation in the general Jewish community; and few have yet contributed arguments to current epistemological, semantic, or metaphysical debate out of distinctively Jewish sources or commitments. How this asymmetry between Jewish and Christian philosophy is to be explained - by the negligence or diffidence of the potential practitioners or their marginalization by the intellectual community - and whether it will disappear in years to come are questions that remain to be answered.

Jhering, Rudolf von (1818-92)

Jhering saw law as a mechanism for achieving current purposes, supplying the compulsion needed where other levers were insufficient to secure the conditions of social life. In this, he took issue with those other nineteenth-century German jurists who regarded law as a settled hierarchy of rules and concepts. He had considerable influence on the development of jurisprudential thought both in Germany and in the USA.

Born in Aurich, a lawyer by education, Jhering taught at various universities, including Basle and Vienna, spending sixteen years at Giessen and twenty at Göttingen, where he died in 1892. He was a gifted lecturer, a prolific and often entertaining writer, a robust debater, an enthusiastic supporter of Bismarck, a once-failed parliamentary candidate and a twice-married family man who enjoyed social life.

Jhering's first research was in Roman law, which remained a lifelong interest. Soon, however, he was concentrating on its evolutionary and comparative aspects, publishing, from 1852-8, several volumes on *Geist des römischen Rechts (The Spirit of Roman Law)*. The work was never completed, as he turned to the development of his own philosophical approach.

This was largely a reaction to the views of two allied and influential schools of German thought. One saw law as something that grew unconsciously, reflecting the spirit of a people (see Jurisprudence, historical; Savigny, F.K. von). The other treated it as a settled hierarchy of rules and concepts, the terms used being sufficient to resolve any problem that might arise. Jhering also took issue with English utilitarianism. Though espousing the notion that law has a purpose and certain of their ideas about human motivation (Jhering expresses these in ways also reminiscent of Adam Smith), he rejected Bentham and Mill's individualism.

Jhering's own views are found in *The Struggle for Law* (1872), arguing that law develops as the result of a 'conscious struggle for claims', and in *Law as a Means to an End* (1877-83). Also unfinished, this presented law as directed to the fulfilling of human interests or purposes, which involve securing 'not merely the conditions of physical existence, but all those goods and pleasures which in the judgment of the subject give life its true value' (1877-83: 331). This requires cooperation, individuals connecting their own interests with those of others and 'the converging of all interests at the same point'. Certain social levers are needed to bring this about. Where duty, love or economic reward prove insufficient, the law steps in to provide the compulsion required.

The connections Jhering made between law, social utility and interests were influential for, though not entirely endorsed in, US thought (see Pound, R.) and for the development of *Interessenjurisprudenz* (the jurisprudence of interests) in Germany, while his analysis of legal coercion seems to foreshadow the ideas of Hans Kelsen.

Some sociologists, however, maintain that his statist and coercive conception of law inadequately reflects social facts. He is also criticized for endorsing such a conception, for taking relativistic views of social utility and justice, and for subordinating individual to social interests. On another understanding, he was actually arguing that it is only possible to secure individual interests in a 'realized partnership of the individual and society'.

Jia Yi (201-169 BC)

Jia Yi, in forging a brilliant synthesis of classical Legalist, Daoist and Confucian doctrines, fashioned a coherent political and educational philosophy in support of strong central government. Jia's impact on Chinese history can hardly be overestimated; his philosophy significantly shaped the imperial institutions of the Han dynasty (202 BC-AD 220), which became the models for successive dynasties of imperial China.

Jia Yi's writings show him to have been a forceful, often iconoclastic thinker. At 20, in recognition of his remarkable erudition, Jia was appointed academician (*boshi*), the highest scholastic honour usually reserved for senior teachers, at the court of Emperor Wen of Han (179-157 BC). By that time, Han rule had been established for some twenty years. Fearing that the court had been lulled into a false sense of security by self-serving advisors, Jia insisted that the empire was neither at peace nor well-ruled. According to Jia's most famous essay, 'Faulting the Qin', an empire may be won by arms but it can only be preserved by 'benevolent government' for: 'The common people in every single case are the basis for the state. … Calamity and good fortune [for the ruler] does not depend upon Heaven, but upon the [will] of the people.' To win their support, good government should (1) establish more lenient penal, tax and *corvée* codes; (2) encourage the 'basic' occupations of farming and weaving, while prohibiting the wasteful production of luxury items; and (3) adopt a new calendar and new ritual standards to further distinguish Han rule from that of the Qin, the previous dynasty, which was widely regarded as oppressive. Once the ruler has won the approval of the masses, Jia argued, he can then inculcate in them the social values that make for stable community. In the process, the ruler maximizes the number of trustworthy subjects from whom he may gather necessary information and advice.

To reduce the likelihood of civil and foreign wars, which inevitably impose the greatest hardship upon the common people, Jia proposed a series of daring initiatives. In effect, the semi-feudal institutions adopted by the Han founder would be dismantled and replaced with centralized institutions. At the same time, Jia devised an insidious plan by which to sap the strength of China's nomadic enemies: Chinese luxury goods, rather than crack troops, would be sent deep into Xiongnu territory. Though senior advisors at court, stung by Jia's criticisms and jealous of his undeniable charisma, persuaded Emperor Wen to send him into virtual exile, most of Jia's policy proposals were implemented soon after his untimely death.

Jia's masterwork, the *Xinshu (New Book)* contains a number of chapters that are less overtly political. For example, the essay 'Arts of the *Dao*' builds upon early Mohist attempts to define systematically fifty-six ethical terms and their antonyms. Three essays identify and consider six patterns inherent in human nature that will lead to virtue if fostered by a classical education: the Way (*dao*), grace, disposition, divine charisma, brilliance and destiny. In addition, several chapters devoted to education attribute the development of the moral sense less to human nature than to intelligent social engineering. Therefore, the skilled use of ritual precepts (especially sumptuary regulations) designed to counter the profit motive can promote a society in which 'no man who is treacherous will benefit, and so all will be good'. Convinced that the single most effective educator in the state is the ruler, whose suasive example in turn insures the survival of the dynasty, Jia Yi also details the proper training of the heir apparent in the ritual and legal precedents that make for strong, yet benevolent government.

Jia's work shows a philosophical coherence far beyond mere rhetorical skill, despite a fundamental tension between his desire to consolidate imperial power and his drive to inculcate ethical values in order to maintain a workable balance of power within the state. With Jia's sophisticated analysis tracing the success of public policy to the quality of the contemporary ritual and educational systems, his writings in these areas are still of considerable interest today.

Joachim of Fiore (*c.*1135-1202)

Joachim was a charismatic monastic reformer and inventive scriptural exegete whose study of the Bible led him to propound complex theories of history. Especially interested in the Apocalypse as a guide to history, he believed that the advent of the Antichrist and a violent end of the age were imminent. Contemporaries considered him a prophet, and this reputation - furthered by spurious works attributed to him - endured for four centuries. His theology, however, was widely criticized by such authoritative thinkers as Aquinas, Bonaventure and Bradwardine.

Joachim was born near Cosenza in Calabria, Italy. Educated as a notary, he began his career at the court of the Norman Kingdom of Sicily. An interior conversion around 1167 prompted him to devote himself to religious life. After false starts as a hermit, itinerant preacher and ordained priest, in 1171 Joachim became a monk (and later abbot) at the Benedictine monastery of Corazzo, where he began his intensive study of the Bible and the Church Fathers. From 1184, he became increasingly preoccupied with his writing, and with the pursuit of a more rigorous monasticism, eventually founding a new monastic order and monastery, San Giovanni in Fiore, around 1190.

Joachim's four major works - *Liber de concordia novi ac veteris testamenti (The Book on the Concord of the New and Old Testaments)*, *Expositio in apocalypsim (Commentary on the Apocalpyse)*, *Psalterium decem chordarum (The Ten-Stringed Psaltery)* and *Tractatus super quatuor evangelia (Treatise on the Four Gospels)* - all begun in or after 1183, interweave novel principles of exegetical theory with the exegesis itself. Except for the *Psalterium*, a study of the Trinity in the form of a commentary on the Psalms, each of these works shows his concern with the patterns of history. The *Liber de concordia* expounds the correspondence of persons and events in the Old Testament to those in the New; the *Expositio* charts the history of the church in the events of the Apocalypse; and the *Tractatus* shows the correspondence of events in the Gospels with events in the shared history of the Jews and the Greek and Latin churches. The premise of all three works is that an understanding of relations between past and present, as read through Scripture, reveals something of future history.

Joachim simultaneously adhered to several theories of history, including the Augustinian seven-age scheme (see Augustinianism) and the division of all history into two periods, one before Christ's incarnation and one after. His own theory, informed by Trinitarian theology, divides all history into three overlapping ages (*status*). Each age, in order, is identified with one person of the Trinity - Father, Son and Holy Spirit - and the relations between the ages reflect relations within the Trinity (see Trinity). Thus, the second age arises out of the first, and the third has its sources in both the first and the second. In the fullness of the third age, the Holy Spirit is to bring peace and religious perfection to the world through a new type of monks, a renewed church and a perfect 'spiritual understanding' of the Old and New Testaments. Joachim believed that tribulations traditionally associated with the end of human history and Christ's return would instead mark the transition to the third age, which he expected by the mid-thirteenth century.

Though he was an idiosyncratic exegete, Joachim's doctrinal polemic against Peter Lombard shows that he was not entirely isolated from the scholastic currents of his day. Joachim's *De unitate et essentia trinitatis* is no longer extant, but we know he accused Lombard of transforming the Trinity into a 'quaternity' by making the divine essence into something really distinct from the three persons. According to Lateran Council IV (1215), which vindicated Lombard and condemned *De unitate*, Joachim erroneously explained the divine essence as a composition of the three persons, thereby compromising divine simplicity (see Simplicity, divine).

Joachim's two other important theological treatises, *De prescientia Dei et predestinatione electorum (On the Foreknowledge of God and the Predestination of the Elect)* and *De articulis fidei (On the Articles of Faith)*, contrast strikingly with his four major works. Setting aside his theories of history, he concentrates on explaining Christian doctrine. *De prescientia* attempts to show that human freedom is compatible with divine grace and foreknowledge. Salvation is impossible without grace, but grace is available to all. It is a matter of free choice whether a person accepts and remains in grace, or rejects it. He emphasizes humility as the virtue by which one can best see and accept God's offer of grace (see Grace; Salvation). Joachim carefully distinguishes between divine foreknowledge and predestination, arguing that God foreknows, but does not predestine, all things. Foreknowledge, he argues, does not compromise human freedom, because God's knowledge is not the antecedent

cause of a future human action, but is itself dependent on that future action's being chosen (see Omniscience).

John of Damascus (*c*.675-*c*.750)

John of Damascus, who lived in the seventh and eighth centuries, is known for his Fount of Knowledge, which became the standard textbook of theology in the Eastern Orthodox tradition, and his opposition to the Iconoclasts, who opposed the use of images in Christian worship. The Fount of Knowledge, which drew heavily on patristic sources, was translated in the West by Robert Grossteste, where it had an influence on writers such as Peter Lombard.

John Mansur, also known as Chrysorrhoas (Golden-tongued), was born of a well-to-do Christian family in Damascus about 675 AD. He was educated by Cosmas, a ransomed Sicilian prisoner. The city was under Arab rule, but John rose in the Muslim administration until the anti-Christian Caliph Malik came to power in 685, when John retired with Cosmas to become a monk at Mar Saba near Jerusalem. He died about 750.

John composed a summa of theology, the *Fount of Knowledge* (after 743), divided into three parts. The first part, translated in the West by Robert Grossteste as the *Dialectica*, is a philosophical dictionary intended as an aid to the study of theology. It defines key terms in logic and metaphysics, many with theological implications, and generally follows the Eastern patristic tradition and responds to its concerns. The logical definitions draw heavily on Porphyry's *Isagōgē*, Ammonius Hermeae's commentary on the same and Aristotle's *Categories* (see Ammonius; Aristotle; Porphyry). The second part, also translated by Grosseteste, is a history of heresies, following verbatim the *Panarion* of Epiphanius of Constantia in most of it, and some other work for more recent heresies. In the last three chapters, which are of John's own composition, he discusses the Muslims, the Iconoclasts and a sect, otherwise unknown, that rejected the sacraments and the priesthood. The third part, the *Exposition of the Orthodox Faith*, was highly regarded in the East, where it has the same status as Aquinas' *Summa theologiae* in the West. Four translations were made of the work in the medieval West, where it was known as *De fide orthodoxa (On the Orthodox Faith)*, the most popular being those of Burgundio (1153-4), and Grosseteste's revision of Burgundio's translation (1235-40). PeterLombard used Burgundio's translation in his *Sentences*. John also wrote polemical tracts against the Muslims, Manichees and various Christian heretics, and *Sacred Parallels*, a collection of biblical and patristic texts chiefly on moral questions, arranged in alphabetical order by topic. Of his devotional and ascetic works, the three sermons on the Assumption of Mary are most famous.

John's writing is a patchwork of selections, generally uncredited, from earlier authors, though his own opinion usually emerges in his selection, omissions and commentary. The lost *Apology* of Aristides was discovered as a speech in his hagiographical romance, *Barlaam and Josaphat*. His philosophical and theological convictions are essentially those of the Cappadocian Fathers (see Patristic philosophy) and Pseudo-Dionysius. Thus he emphasizes the incomprehensibility of God's nature, particularly in connection with the Trinity, where the distinction of Persons is only thought, but nonetheless objective. He shows no knowledge of Augustine, or any other Western writer except Leo the Great. In the West, Walter of St Victor identified John as an opponent of the Augustinian *filioque* doctrine, which holds that the Spirit proceeds from both the Father and the Son, and John did hold, with Gregory of Nyssa, that the Son and the Spirit 'co-originate' from the Father, and though the Son is first-born, the nature of this priority cannot be grasped intellectually. In particular, though the Spirit proceeds from ([eacgr]k) the Father ('from' indicating a causal relation), it arises and is manifested through (δι[aacgr]) the Son (see Trinity).

John is most noted for his role in the Iconoclastic controversy, supporting the veneration of images in three *Discourses Against the Iconcolasts* (726-30) that formed the basis for the orthodox view in the Eastern Church. He could oppose the Iconoclastic Emperor Leo III in part because he lived outside the Byzantine Empire. Though condemned in the Iconoclastic Synod of 754, John was vindicated by the second Nicaean Council of 787, and has been considered a saint since the ninth century. He argued that God is beyond both being and knowledge, and so before the Incarnation it was suitable that he not be represented by any earthly image. However, he is now just as suitably worshipped in his manifestation as Jesus Christ, for just as Christ is truly God and truly man, and even the fleshly man Jesus is worthy of worship, so an image of this man is truly an image of God. It represents the now visible God, even when it represents suffering and ignominy. Therefore, whoever confesses the genuineness of the Incarnation ought to accept the veneration of images.

Florovsky, G. (1987) *The Byzantine Fathers of the Sixth to Eighth Century*, trans. R. Miller and A.M. Dollinger-Labriolle, Collected Works of Georges Florovsky, Vaduz: Bücher vertriebs anstalt, vol. 9, 254-92. (An excellent discussion of John's theology.)

John of Jandun (*c.*1280/9-1328)

John of Jandun was the most important medieval philosopher in the Latin West to consider Averroes the true interpreter of the thought of Aristotle. He considered Aristotle to be 'the prince of philosophers', and Averroes to be the best philosopher after him. Jandun's defense of Averroes' attributing to Aristotle the doctrine that the intellect is one for all humans, and his own interpretation of various doctrines of Averroes, were much debated and criticized in Italy during the late fifteenth and the sixteenth centuries.

John of Jandun was a native of the small town of Jandun, near Rheims. Since he was a master of arts at Paris by the year 1310, he must have been born sometime before 1290, probably between 1280 and 1289. His earliest work was a question on the agent sense written in reply to a sophisma on the subject by Bartholomew of Bruges. He taught at the new College of Navarre from 1315 onwards. Jandun was closely identified with Marsilius of Padua, and fled Paris with him in 1326 when Marsilius' authorship of the *Defensor pacis* became known. Both went to the court of Emperor Ludwig of Bavaria. Excommunicated in 1327, Jandun died the following year.

In his questions on Aristotle's *Physics*, which were finished in 1315, Jandun insists that philosophical reasoning must be based on self-evident principles that agree with what is experienced by the senses. The first part of natural philosophy, namely physics, has as its subject matter mobile being or mobile body. It treats of things in motion, motion itself and the principles of motion. This science is in no way subordinated to metaphysics. Indeed, it is necessary for human happiness, since without it humans cannot know God perfectly in this life. It belongs to the natural philosopher and not to the metaphysician to demonstrate the existence of God and separated substances (the Intelligences), and to prove that they and God are immaterial (see Natural philosophy, medieval). The metaphysician's proper task is to determine the quiddity of God and the separated substances. Jandun denies that philosophers such as Aristotle and Averroes (see Ibn Rushd) could have known creation from nothing, since their knowledge starts with what can be known through the senses. That all things were created by God, including the first man, must be held both according to Christian faith and according to truth. In like fashion, while the resurrection of numerically the same individual human being is impossible according to the philosophers, it should be asserted on the basis of faith.

Jandun's psychological views are to be found especially in his questions on Aristotle's *De anima*. (There are two versions of Books I and II but only one of Book III.) However, he also discusses psychological topics in other question-commentaries on Aristotle and in independent questions. Although he does take Aristotle and Averroes to be the best and the next best philosopher and spends much effort on explicating their common position on the soul and intellect, he makes clear that he does not think that they knew the truth. Against their views, Jandun proclaims that he accepts as true that the human soul is created from nothing by God, is the form of the human body that gives existence to the body, and has immaterial powers of an agent intellect and a potential possible intellect. However, he insists that none of these things was held by Aristotle, nor can any of them be demonstrated by natural reason. On the contrary, since the miraculous is involved, these things are held only on faith.

Against Albert the Great and Thomas Aquinas, he maintains the plurality of forms in the human being. Jandun is insistent that if the intellective soul were the act of the body, giving it existence (*esse*) and united to it in existence - as Aquinas held - it would be corruptible. There are in fact two forms of the human body. The one is the sensitive or cogitative soul which gives existence to the body; the other is the intellective soul that is a single separate substance and one for all humans. It is a form only in an extended meaning of the term. Borrowing from the *de anima intellectiva* of Siger of Brabant, whom he mentions by name, Jandun explains that the intellective soul is an active cause that operates within the body (*operans intrinsecum*). It is united to the body in its operation as a sailor is united with his ship. Jandun attempts to answer two objections, namely that his account of Aristotle and Averroes would mean that the individual human being (a) does not really think and (b) lacks unity. The latter objection he admits to be the greatest difficulty and the strongest point of those who attack Averroes (see Soul, nature and immortality of the).

The intellective soul is itself composed of two different essential parts, an agent intellect and a potential (possible) intellect. Jandun denies that the agent intellect is God for Averroes, and against Thomas Wilton's proposal that the potential intellect is active, Jandun insists that it is not. He takes the phantasm to be the immediate active principle

of the intelligible species produced in the potential intellect, while the agent intellect is simply the immediate active principle of the act of thinking. The agent intellect's 'abstracting' is not a process of universalizing the content of the phantasm, but rather simply causes the act of thinking. Jandun's attributing the notion of intelligible species to Averroes was later attacked by Renaissance Aristotelians such as Agostino Nifo.

Jandun maintains that after the human being has developed its speculative intellect and has been united to all the intelligible species in the possible intellect, it knows the separate agent intellect intuitively and then ascends through the different separate substances until it enjoys an intuitive knowledge of God.

In the realm of metaphysics, Jandun shows his allegiance to Averroes in his denial that there is any distinction of essence and existence. Unlike Siger of Brabant, he does not appear to accept the doctrine of participation as central to his metaphysics. In various writings, Jandun accuses Aquinas of attempting to contradict Averroes but considers his labours to have been in vain (*Physics* VII, q.2). Jandun's different treatises on the agent sense would mark him as one of the major sources of the long discussion of this topic that lasted until the end of the sixteenth century.

List of works

John of Jandun (before 1328) *In libros Aristotelis De coelo et mundo quae estant quaestiones subtilissimae (Commentary on Aristotle's On the Heavens and Earth)*, Venice: Iuntas, 1552.(This edition also contains a work on the *De substantia orbis* that is not by Jandun.)

John of Jandun (before 1328) *Quaestio de habitu intellectus (Question on the Disposition of the Intellect)*, in Z. Kuksewicz, 'Les trois "Quaestiones de habitu" dans le ms. Vat. Ottob. 318. Editions des textes de Jean de Jandun, Guillaume Alnwick et Anselme de Côme (?)', *Mediaevalia philosophica Polonorum* 9, 1961: 3-30. (Edition of one of Jandun's Questions.)

John of Jandun (before 1328) *Quaestio de infinitate vigoris Dei (Question on God's Power)*, in Z. Kuksewicz, '*De infinitate vigoris Dei* des Pariser Averroisten Johannes de Janduno', *Manuscripta* 9, 1965: 167-70.(Edition of one of Jandun's Questions.)

John of Jandun (before 1328) *Quaestio de notioritate universalium (Questions on Universals as Better Known [than Particulars])*, in Z. Kuksewicz, 'La *quaestio de notioritate universalium* de Jean de Jandun', *Mediaevalia philosophica Polonorum* 14, 1970: 87-97.(Edition of one of Jandun's Questions.)

John of Jandun (before 1328) *Quaestio de principio individuationis (Question on the Principle of Individuation)*, in Z. Kuksewicz, '*De principio individuationis* de Jean de Jandun', *Mediaevalia philosophica Polonorum* 11, 1963: 93-106.(Edition of one of Jandun's Questions.)

John of Jandun (before 1328) *Quaestio utrum aeternis repugnet habere causam efficientem (Question: Is Having an Efficient Cause Incompatible with Eternal Things)*, in A. Maurer, 'John of Jandun and the Divine Causality', *Mediaeval Studies* 17, 1980: 198-207; repr. in A. Maurer, *Being and Knowing: Studies in Thomas Aquinas and Later Medieval Philosophers*, Toronto, Ont.: Pontifical Institute of Mediaeval Studies, 1980, 275-308.(Edition of one of Jandun's Questions.)

John of Jandun (before 1328) *Quaestio utrum forma substantalis perficiens materiam sit corruptibilis (Question: Is the Substantial Form that Perfects Matter Corruptible?)*, in Z. Kuksewicz (ed.) *Averroïsme bolonais au XIVe siècle: Edition des textes*, Ossolineum: Editions de l'Academie Polonaise des Sciences, 1965.(Edition of one of Jandun's Questions.)

John of Jandun (before 1328) *Quaestiones in duodecim libros Metaphysicae iuxta Aristotelis et magni Commentatoris intentionem disputatae (Disputed Questions on Aristotle's Metaphysics and the Great Commentator's Intention)*, Venice: Hieronymus Scotus, 1553; repr. Frankfurt: Minerva, 1966.(Edition of the disputed questions.)

John of Jandun (before 1328) *Quaestiones super metaphysicam (Questions on the Metaphysics)*, Book IV, q. 6, Book VI, q. 8 and Book VII, q. 6, are reprinted in R. Lambertini and A. Tabarroni, 'Le *Quaestiones super Metaphysicam* attribuite a Giovanni di Jandun. Osservazioni e problemi', *Medioevo* 10, 1984: 41-104. (Questions on Aristotle.)

John of Jandun (before 1328) *Sophisma de sensu agente (Sophisma on the Agent Sense)*, in A. Pattin (ed.) *Pour l'histoire du sens agent: La controverse entre Barthélemy de Bruges et Jean de Jandun, ses antécédents et son évolution*, Louvain: Presses Universitaires de Louvain, 1988, 118-65.(Jandun on the intellect.)

John of Jandun (before 1328) *Super libros Aristotelis De anima subtilissimae quaestiones (Questions on Aristotle's On the Soul)*, Venice: Heirs of Hieronymus Scotus, 1587; repr. Frankfurt: Minerva, 1966. (Questions on Aristotle, Jandun's major psychological work.)

John of Jandun (before 1328) *Super octo libros Aristotelis de physico auditu subtilissimae quaestiones (Questions on Aristotle's Physics)*, Venice: Iuntas, 1587; repr. Frankfurt: Minerva, 1969.(Questions on Aristotle.)

John of Jandun (before 1328) *Super parvis naturalibus Aristotelis quaestiones perutiles ac eleganter discussae (Questions on Aristotle's Parva naturalia)*, ed. M. Zimara, Venice: Heirs of Octavianus Scotus, 1505. (Questions on Aristotle.)

John of Jandun (before 1328) *Tractatus de laudibus Parisius (A Treatise on the Praises of Paris)*, in *Paris et ses historiens aux XIV^e et XV^e siècles*, ed. Le Roux de Lincy and L.M. Tisserand, Paris: Imprimerie Impériale, 1867, 32-79.(Jandun on the city of Paris.)

John of Jandun (before 1328) *Tractatus de sensu agente (A Treatise on the Agent Sense)*, in A. Pattin (ed.) (1988) *Pour l'histoire du sens agent: La controverse entre Barthélemy de Bruges et Jean de Jandun, ses antécédents et son évolution*, Louvain: Presses Universitaires de Louvain, 166-222.(Jandun on the intellect.)

John of La Rochelle (d.1245)

John of La Rochelle was one of the first generation of Franciscan theologians at the University of Paris. What little is known of his life places him as a close partner to the greatest of the early Franciscan teachers, Alexander of Hales. John collaborated with Alexander not only in steering the Franciscan order towards some sort of institutional equilibrium, but also in the elaboration of the first synthesis of Franciscan theology, the Summa Fratris Alexandri (Summa of Brother Alexander). Whole sections of the Summa were written by John, most notably the treatment of moral law. John wrote in his own voice a number of theological works and two books on the soul, the Tractatus de divisione multiplici potentiarum animae (Treatise on the Multiple Division of the Soul's Power) and the Summa de anima (Summa on the Soul).

John seems to have entered the Franciscan order around 1230. He then studied theology at Paris, perhaps under Alexander of Hales, the most important Franciscan theologian. John became a Master of Theology in 1236, but he remained associated with Alexander in his work and in the public imagination. Indeed, he joined with Alexander in helping to depose Brother Elias as minister general of the Franciscans. He then collaborated with Alexander and two other Franciscans to write an important commentary on the Franciscan rule in 1240-1. John was also, and more influentially, a member of the team of editors that composed a massive summa of theology, which was attributed as a whole to Alexander, from affection or filial piety, under the title *Summa Fratris Alexandri (Summa of Brother Alexander)*. Significant sections of the *Summa* were written by John, most notably the treatment of moral law. He also wrote in his own name in the genres typically used by Parisian masters of theology, producing sermons, a treatise on preaching, disputed questions and various short treatises (on grace, the articles of faith, the sacraments and topics in moral theology). John was praised by his contemporaries for his gift of clarifying inherited material by organizing it around central theological themes.

John's interest in philosophical topics seem to have been focused on the human soul, its nature and its moral dispositions. In this interest, John shows himself the heir of several twelfth-century genres, most notably treatises on natural philosophy, summaries of virtues or vices and handbooks of spiritual psychology. John also inherits Aristotle's *On the Soul* and the annexed biological books, as well as the ample erudition of newly translated Arabic medicine. He is, like his contemporary Vincent of Beauvais, within reach of an ever-expanding philosophical library. The temptation merely to accumulate citations was real, but not fatal. Indeed, John's two works on the soul move from encyclopedism to a more disciplined consideration of the soul. The first work, the *Tractatus de divisione multiplici potentiarum animae (Treatise on the Many Divisions of the Soul's Powers)*, is encyclopedic in its selection and handling of authorities. The second work, the *Summa de anima (Summa on the Soul)*, excludes a number of topics and precedent texts in order to present a tighter arrangement of its teaching. Unfortunately, only the *Tractatus* is readily available in a modern edition. Fortunately, it shows more clearly than the *Summa* how John appropriates and begins to transform his philosophical sources.

According to John's own explanation, the *Tractatus* is divided into three parts that correspond to three ways of considering the soul: according to definition, according to division and according to completion or perfection. The parts are not equal in length nor, one presumes, in importance. The division of the soul's powers is by far the longest; the consideration according to definition by far the shortest. There is also marked variety in the complexity of internal organization. The first part proposes and explains in linear sequence eleven different definitions of the soul. The second part can be broken into five sections: philosophical divisions of the soul's powers, with special attention to Avicenna (see Ibn Sina); medical divisions; a division by John Damascene (see John of Damascus); a division by Augustine; and a review of some individual powers. These powers include what John distinguishes as reason, intellect, spirit (in both intellectual and physiological senses), will, intelligence and imagination. His third part can be understood as treating three large topics: grace and its divisions; the virtues, both philosophical and theological; and beatitude.

Even this brief summary will suggest that John has luxuriant vocabularies for discriminating among internal 'faculties'. His problem is rather to simplify than to complicate the resulting descriptions. John's typical procedure in each of the three parts of the *Tractatus* is to assemble authoritative texts on the point at hand and then to analyze their competing vocabularies. These authorities cover an enormous range, and are by no means exclusively

philosophical. Definitions of the soul are taken from Plato, Aristotle, Seneca, the Book of Genesis, Nemesius of Emesa (cited as ‘Remigius’), John Damascene and the anonymous Cistercian work *On Spirit and Soul*. Among the five different divisions of the soul considered, there are medical schemata taken from Johannitius (Hunayn ibn Ishaq) and Avicenna’s *Canon of Medicine*. Even when John moves on from these schemata to consider some of the soul’s powers individually, he seems principally concerned to catalogue various descriptions of each. But John is no mere copyist, even in the *Tractatus*. He often uses one or another text to provoke an extended discussion in the style of a disputed question. For example, a definition taken from Boethius occasions a string of questions on what kind of existence ultimate happiness can have in the soul. John replies with careful distinctions among virtue, passion, habit and power, as well as with technical efforts to situate the gift of blessedness with respect to each power’s sphere of action. In this way, John’s *Tractatus* shows the labour of conceptual clarification required during the first half of the thirteenth century as masters of theology read their ways into the flood of newly translated philosophy.

John of Mirecourt (*fl. c.*1345)

The traditional view that John of Mirecourt was condemned because he was a radical sceptic has been brought into question by more extensive research on his writings. For example, it appears that he did not doubt the existence of God as he was accused of doing. John was, however, greatly interested in describing as accurately as possible the kinds of evidence that lead to knowledge and the means by which they are produced.

John of Mirecourt, a Cistercian monk, lectured on the *Sentences* of Peter Lombard at the University of Paris during 1344-5. Propositions drawn from his *Sentences* commentary were condemned by the chancellor of the university in 1347. Against an initial list of condemned propositions, Mirecourt issued an apology in 63 articles, and then later, in reply to the official list of condemned propositions, he issued a further apology in 41 articles. Study of Mirecourt's thought has been hampered by the lack of a critical edition of the full *Sentences* commentary. The edition of the two apologies includes brief excerpts from the commentary, and questions I 2-6 (on knowledge) and I 13-16 (on enjoyment of God) have been edited. In addition, a few scholars have based their discussions of specific issues on examinations of unedited questions. However, as the table of contents printed in Tessier (1974) indicates, much more remains to be done before Mirecourt's thought may be properly assessed.

As is true of several of his contemporaries at Paris, Mirecourt's areas of special interest and the methods of inquiry he uses to pursue them show the influence of debates at Oxford earlier in the century. For example, Mirecourt displays interest in specifying and carefully describing the kinds and sources of human knowledge. He distinguishes suspicion or opinion (based on 'inevident assent' given with some concern about actual or potential error) from knowledge proper, relying on 'evident assent' given without fear of actual or potential error. Two sorts of evidence lead to evident assent: 'special' and 'natural'. Only the principle of non-contradiction, conclusions based upon it and propositions reducible to it are specially evident. Propositions derived from experience are nearly always proven only by natural evidence; the only exceptions (an example Mirecourt derives from Augustine) are those referring to the speaker's own existence, since one who doubts such a proposition would contradict one's intuitive awareness of one's own existence.

Mirecourt's careful investigation of the cognitive processes by which we acquire natural evidence shows not scepticism about the reliability of natural compared with special evidence, but deep interest in the debates at Oxford about the mechanism and respective priority of intuitive and abstractive cognition. His familiarity with these debates is revealed as a result of his style of argument: he tends to include a wide range of possible positions and to give detailed arguments for and against each one. While it is not always easy to determine Mirecourt's own view - he does not always indicate which side (if either) of an argument he prefers - on the whole it appears that Mirecourt tightens up the conditions for the acts of cognition that precede assent to natural evidence so as to reduce or eliminate intermediaries between the object of cognition and its subject. Like Adam Wodeham, Mirecourt rejects any extension of intuitive cognition to cover cases other than simple apprehension in the presence of its object: he ascribes Scotus' and Ockham's imperfect intuitive cognition (the cognition of an existent object not present at the time) to memory, and appears also to reject any intuitive cognition of non-existents (see Duns Scotus, J.; William of Ockham). While Mirecourt agrees with the usual view that abstractive cognition does not depend on the existence and presence of its object, he advances a number of arguments that propose (as Ockham did) that it does not rely on intermediary *species*, but instead results more directly from a prior intuitive cognition or from a *habitus* (that is, a disposition produced by one or several cognitions in the past).

Besides the compendious tendency of his questions, another characteristic of fourteenth-century English philosophy found in Mirecourt is his interest in using new logical and scientific techniques in order to discuss theology. For example, he uses proportional analysis to explain the conventional distinction between *usus* and *fruitio*, the 'use' and 'enjoyment' of an achieved end, and discusses questions of human will and merit using theories of intension and remission and of extrinsic limits (see Natural philosophy, medieval; Oxford Calculators). It may have been the style and methodology of Mirecourt's commentary more than the views it expressed that got him into trouble with the authorities at Paris: if, indeed, the condemnation was motivated by anything other than the simple malice to which Ceffons and d'Ailly attribute it (for the suggestion that the real controversy producing the Paris condemnations was over methodology, and references to the remarks of Peter Ceffons and Pierre d'Ailly,

see Tachau (1988): 379-80, and Courtenay (1973): 173).

John of Paris (*c*.1260-1306)

John of Paris was a prominent Dominican theologian at Paris at the end of thirteenth century. He began his career with polemical works in defense of Thomist positions. In them, he asserts the distinction between essence and existence, the unity of substantial form and the function of matter as principle of bodily individuation. John later took part in wider controversies, including those between the French crown and the papacy. His best known work is a treatise on the mutual independence of secular and spiritual authority.

John of Paris (or John Quidort) spent much of his life as a controversialist. After the deaths of Thomas Aquinas in 1274 and Albert the Great in 1280, the Dominicans were pressed to explain their appropriation of Aristotelian doctrines in theology (see Aristotelianism, medieval). However, the strife between Thomists and anti-Thomists, or ‘Aristotelians’ and ‘Augustinians’, was symptomatic of deeper tensions in the theological use of philosophy. The controversies produced by these tensions dominated John’s career as a teacher and writer.

The year of John’s birth is uncertain. Probably he was studying as a Dominican in Paris by the end of the 1270s. What is certain is that John’s first large-scale work, written in the early 1280s, was a work by a Dominican on behalf of Dominicans. It had its origin in a controversy that threatened the standing of the order generally and of its Parisian house in particular: the controversy over Thomas Aquinas’ adaptations of Aristotle.

After March 1277 and before August 1279, the Franciscan William de La Mare wrote his *Correctorium fratris Thomae (Correctory of Brother Thomas)*, a collection of about 118 passages from Aquinas’s works, mostly from the first part of the *Summa theologiae*. William described, criticized and refuted each passage by authoritative texts drawn from the Bible and other authorities. In 1282, the Franciscan order decreed that Aquinas’ *Summa* was not to be read in Franciscan houses except when it was accompanied by William’s ‘declarations’. However, the Dominicans, who dubbed William’s work the ‘Corruptory’, had already begun to produce rebuttals. John of Paris undertook to write one of these, which is known by its opening word as *Sciendum*. His eclectic defence of Thomas is marked by an emphasis on the logic of terms and demonstrations, and is concerned primarily with showing flaws in the complaints of his opponents.

In 1292, John began his commentary on the *Sentences* of Peter Lombard, in which he takes up and augments Thomist positions. It is perhaps not surprising, then, that sixteen theses in it were singled out as heterodox. John’s point-by-point replies to the charge seem scattered and pusillanimous. Still, John also defended himself in a public disputation on the distinction between essence and existence. His defence contains several striking passages of metaphysical analysis.

John’s best known and most influential work is the short treatise *De potestate regia et papali (On Royal and Papal Power)*, his contribution to the quarrel between Philip IV of France and Pope Boniface VIII. The quarrel began in 1296 over the crown’s right to tax clerical property without seeking permission from the papacy. The resolution of the immediate dispute did not settle its principles, the most pertinent of which was the king’s claim that in the temporal regimen of his kingdom he was not subject to the rule of the pope. Boniface asserted the papacy’s right to judge the actions of all, kings included. The French party replied with a call for Boniface’s trial before a general council of the Church on charges of heresy and simony. In this atmosphere, but before agents of the French king finally arrested the pope, John wrote his measured defence of the separation of royal and papal power.

The treatise traces something like the dialectic of a medieval disputed question. Its first ten chapters describe general principles of secular and ecclesiastical power, including the principle that bishops have as such no civil jurisdiction. In the eleventh chapter, John rehearses forty-two arguments for the opposing, papal side. He then turns in Chapters 12 and 13 to deciding the question, to weigh the merits of the two sides. He argues that God gave to the Church a spiritual power comprising the capacity to perform its sacraments, the authority to teach the faithful and to coerce those who despise the sacraments, and a proper provision both for the differentiation and support of its ministers. God did not give the Church as such any direct temporal power or jurisdiction. Having set forth this determination, John proceeds in Chapters 14-20 to reply to each of the forty-two arguments advanced from the other side. He then adds five chapters in something like an appendix, addressing the so-called ‘donation of Constantine’, the claim that the papacy was immune from criticism and the issue of papal abdication. John’s

treatise proved quite influential, especially in the Gallican movement of the seventeenth century.

Determinatio de modo existendi corporis Christi in sacramento altaris (Determination on the Manner of Existing of Christ's Body in the Sacrament of the Altar), John's last and in some ways most controversial work, was an attempt to offer an alternative to Aquinas' understanding of the transubstantiation of bread and wine in the celebration of the Eucharist, namely that Christ assumes the bread and wine as he assumed a human body. This view was immediately contested. In 1305, John was censured by an episcopal commission for his alternative teaching. He died at Bordeaux in September 1306 while awaiting a ruling on his appeal to the papacy.

John of Salisbury (1115/20-1180)

John of Salisbury is one of the most learned and penetrating of twelfth-century Latin writers on moral and political matters. In his style as in his teaching, John represents a style of medieval philosophy heavily indebted to Roman models of rhetorical education. His interests in grammar, dialectic, politics and ethics are subordinated to an over-arching concern for moral formation. Three of John's works stand out. The Entheticus de dogmate philosophorum (Entheticus of the Teaching of the Philosophers) is a satire on the pretensions and immoralities of those who divorce eloquence from philosophy in order to pursue power. The Metalogicon defends the traditional arts of the trivium *and asserts the unity of eloquence and the other verbal arts with philosophy. By far the most important is the* Policraticus*, a sustained argument for philosophic wisdom against the vanities of worldly success, especially in politics.*

1 Life

John of Salisbury is one of the most learned, acerbic, reactionary and penetrating of twelfth-century Latin writers of moral and political philosophy. His writing and teaching represent the culmination of a style of medieval philosophy heavily indebted to Roman models of rhetorical formation, especially to Cicero and Seneca. His discussions of grammar, dialectic, politics and ethics are subordinated to an over-arching concern for moral formation. Indeed, John may well be considered one of the pre-eminent figures for the history of moral philosophy in the Latin West before the re-introduction of Aristotle's *Nicomachean Ethics*.

Little is known of John's early life. He traveled in 1136 to Paris to study at Mont-Saint-Geneviève, then the site of numerous schools of the liberal arts and theology. From the *Metalogicon* we learn that John studied with Peter Abelard, William of Conches, Thierry of Chartres, Adam of Petit-Pont and Gilbert of Poitiers. In 1147, John joined the household of Theobald, Archbishop of Canterbury, traveling as his envoy to the Continent and managing his complex domestic affairs. Among Theobald's other aides, and so among John's friends, the most notable figure was Thomas Becket. In 1156, Henry II banished John from the English court for two years for being over-loud in defence of Church rights against the crown. He regained favour, only to lose it again by supporting Becket's cause after 1162. He spent much of the 1160s in exile on the Continent, lobbying for the rights of the English church and trying to find some middle ground between the arrogance of the crown and the recalcitrance of his friend, the archbishop. After Becket's murder, John returned to England and to new ecclesiastical offices. In 1176, he was called back to the Continent as bishop of Chartres, where he died in 1180.

John complained of the pressures of his ministerial occupations, but found time for a brilliant literary career. His writings fall into two classes. Before the struggles of the 1260s, John wrote a number of works in the liberal arts and philosophy. Three of these are notable for their philosophic teaching: *Entheticus de dogmate philosophorum (Entheticus of the Teaching of the Philosophers)*, completed probably in 1156, the *Metalogicon* in 1159, and the *Policraticus*, also in 1159. Later, John turned to ecclesiastical history, writing his memoirs of the papal court, the *Pontifical History*, and very polished lives of Anselm of Canterbury and Becket.

2 Works

The *Entheticus* is the earliest of John's major works, and it sketches out in poetic form some of the concerns that would preoccupy him in all of them. There is evidence that the *Entheticus* was never finished and, hence, never intended for circulation outside a small circle of friends. It is hard to imagine a satire of such specific ferocity ever being offered to the public. The work begins by defending the alliance of reason and eloquence against the decadence of John's contemporaries. It next extols philosophy, bringing forward the principal teachers of antiquity. The conclusion of the hortatory argument is the superiority of Christian wisdom and the folly of an exclusive infatuation with logic. The poem then breaks off to describe, in harsh terms, the little book's imagined voyage to the royal court. It ends with a brief epilogue on grace. Readers have found it hard to discern any single plan in the *Entheticus*; John took his patterns of composition from the dialectical, digressive masters of Roman oratory. He is less concerned with demonstration or analysis than with producing rhetorical effects by which the reader may be persuaded to a virtuous life.

The *Metalogicon* is often pillaged for what it records of the Parisian schools in the twelfth century. It deserves

better. With the *Metalogicon*, John first achieves the kind of scope needed for his pedagogical project. The work presents itself as a reply to unnamed opponents who have, once again, arrogantly denied the importance of eloquence to philosophy, thereby upending the whole order of liberal arts and so wrecking the foundation of philosophy. John undertakes to show what unites the verbal arts with each other and why they are all necessary for philosophy. Much of what follows in the *Metalogicon* is an erudite rehearsal of lessons about the interrelations of grammar and logic, including all of the pieces of Aristotle's *Organon*. Shorter, more elliptical lessons are recalled about philology and eloquence. However, John interrupts or enriches his rehearsal with explanations of the sources of cognition, the nature of moral virtue and the limitations of philosophy in regard to faith. The *Metalogicon* is not so much a handbook of the verbal arts, then, as an extended argument for the instrumental use of a unified *trivium* in the service of moral philosophy.

The *Policraticus*, John's last and most famous philosophical book, is typically studied as a work of political philosophy, best known for some remarks on the justice of killing tyrants, but the work is considerably more. John intends it as an extended invitation to take up philosophic life, by which he means the pursuit of the moral good. The basic contrast of the *Policraticus* is between the 'frivolity of courtiers' and the 'traces of the philosophers', between the evident emptiness of lives squandered on worldly ambition and the alluring reminders of lives devoted to the pursuit of truth. For example, Book 1 shows how the talented are corrupted by cheap gifts into the pursuit of any number of unsuitable ends: hunting, gambling, theatre and especially the shams of magic. Book 2 then distinguishes useless superstition from the pious interpretation of natural phenomena as signs of divine will. This dialectical progression, of invective and instruction, of misuse and right use, runs throughout the *Policraticus*.

For that reason, the work cannot be mapped in a small space. Indeed, John takes different maps for different parts of his text. *Policraticus* 4, for example, is loosely ordered as a commentary on Deuteronomy 17: 14-20, a passage introduced to support the claim that princes ought to be subservient to the divine law. John not only dilates the commentary over eight chapters, he omits, perhaps deliberately, certain parts of the biblical text, such as its prescriptions for the selection of rulers. Book 5 develops an analogy between the human body and human government: the prince is the head, the senate the heart, and so on. Present throughout the work are bits of moral invective, poetic quotations and historical examples, both pagan and biblical. The examples are probably the most important element in John's notion of moral teaching. He seems to find in these carefully chosen tales not just colour or incident, but the deeper logic of moral consequences.

If John's larger structures are loose, they are not negligible. In one crucial case, the structure of his argument settles a vexed problem of interpretation: whether John does or does not advocate the killing of tyrants. The claim that he does usually relies on an extended discussion of tyranny in *Policraticus* 8, though the text seems very unsatisfying as a guide to assassination. It is a description of tyranny as a moral anti-type, as a negation of what should be sought in a philosophically ordered life. Tyrants live deformed lives and so meet with hideous deaths, which they deserve because their lives deform what is fundamental in human morality. The discussion of tyranny is a striking and even terrifying depiction of the anti-type of morality. The reader can learn this from Book 8's rhetorical structure. It begins with a critique of the Epicureans, who, John says, taught self-love and self-indulgence, the fundamental vices from which tyranny springs and also, not coincidentally, the typical vices of courtiers. Hence the critique of Epicureanism, the antithesis of philosophy, is properly followed by the depiction of the tyrant and then by a moral peroration in which the reader is asked for a last time to reject the failed life of Epicureanism, the vanity of courtiers, in favour of the morally good life taught by philosophy (see Epicureanism).

What remains truly puzzling in the *Policraticus* is John's integral appropriation of pagan philosophy even as he professes the Christian faith. He is fond of juxtaposing the two: he compares Christ with Odysseus, and supplements Socrates with the Bible. He does sometimes stop to justify at least a piece of his practice, as when he argues that he can use pagan examples because Paul used them. However, John seems most often to proceed as if Christianity could complete pagan philosophy without conflict and without remainder. If he censures pagan superstition, he immediately praises pagan wisdom, and he frequently quotes the Roman poets as moral authorities. In these details as much as in his professed teaching, John shows a characteristic confidence in the unity of human learning. He also shows his antipathy to the separation of philosophy either from the liberal arts that lead to it or from the Christian theology that completes it.

John of St Thomas (1589-1644)

The seventeenth-century Portuguese Dominican, John of St Thomas or John Poinsot, was a major figure in late scholastic philosophy and theology. Educated at Coimbra and Louvain, he taught both disciplines in Spain: at Madrid, Plasencia and Alcalá. Aspiring to be a faithful disciple of Thomas Aquinas, he published a three-volume Cursus philosophicus thomisticus (Thomistic Philosophical Course) and before he died began the publication of a Cursus theologicus (Theological Course). His philosophical writing was explicitly on logic and natural philosophy. However, in both his philosophical and theological works, he treated many metaphysical, epistemological and ethical issues. His logic is divided into two parts, formal and material. Of particular interest is his semiotic doctrine which appears in the second part. In natural philosophy, he explained Aristotle with a Thomistic slant. While following Aquinas in theology, John at times developed his master's doctrine along new lines. Both in his own time and after he has had considerable authority within scholasticism, especially for Thomists. Among those whom he has influenced in twentieth-century Thomism are Joseph Gredt, Reginald Garrigou-Lagrange, Santiago Ramirez, Jacques Maritain and Yves Simon.

1 Life and works

John of St Thomas was born John Poinsot in Lisbon. He studied humanities and philosophy at the University of Coimbra, where in 1605 he received a bachelor of arts degree. While studying philosophy, he probably attended lectures given by the Jesuits who directed the College of Arts at Coimbra and whose course in philosophy was published in five volumes which appeared successively between 1562 and 1606 (see Collegium Conimbricense). In October 1605, John began the study of theology at Coimbra and the following year he continued this at Louvain where in 1608 he gained his bachelor's degree in biblical studies. On 17 July 1609, he entered the Order of Preachers (the Dominicans) at the Convent of Our Lady of Atocha in Madrid, where he spent the next year. On 17 July 1610, he made his formal profession as a Dominican and at this time chose the name by which he would be known in religion: John of St Thomas. From 1610 to 1615 he studied philosophy and theology at the Atocha convent where from 1615 to 1620 he taught arts. In 1620, he went as lecturer in theology to the Dominican priory at Plasencia. Between 1625 and 1630 he was a lecturer in arts and theology at the Dominican College of St Thomas in Alcalá. In 1626, he became regent of studies there and in 1627 was appointed a consultant for the Supreme Tribunal of the Spanish Inquisition. From 1630 to 1640, he held the *cátedra de vísperas* (chair of vespers) in theology at the University of Alcalá. During this period he received his doctorate in theology in 1633 and he published, at Alcalá and Madrid, his logic and natural philosophy, which, printed together at Rome in 1637-8 and at Cologne in 1638, became his *Cursus philosophicus thomisticus (Thomistic Philosophical Course)*. At Alcalá in 1637, he began to publish his *Cursus theologicus (Theological Course)*, which was completed posthumously from its author's manuscripts edited by Diego Ramirez, Jacques Quetif and Francis Combefis. In 1641 he attained at Alcalá the theological *cátedra de prima* (chair of prime), which he held until 1643. In that year, he was appointed confessor to King Philip IV. Accompanying the king on an expedition to Catalonia, John was stricken by fever at the siege of Lerida and died at Fraga in Aragon.

Most of all, John of St Thomas aimed at being a true disciple of Thomas Aquinas. As he tells us in his *Cursus theologicus* (I d.2 a.5), this entailed two things: (1) to follow Aquinas' doctrine as true and Catholic, and (2) to develop it as much as possible. Since beyond Aquinas in philosophy there was Aristotle, John's own philosophical work was also very much in the vein of Aristotelian commentary (see Aristotelianism, Renaissance). Explicitly, as published, that work was in logic and natural philosophy. However, in both his philosophical and theological writings, he covered numerous issues in metaphysics, epistemology and ethics. On such issues he almost invariably sought to defend Thomistic doctrine against its adversaries. Chief among these, as John saw them, were the Jesuits, Gabriel Vásquez (1549-1604) and Francisco Suárez.

2 Logic

John of St Thomas' logic is divided into two parts. In the first part, his concern is with the formal theory of correct thinking. This part, which includes such medieval items as supposition, exponibles and consequences, corresponds especially to the *Summulae Logicales* of Peter of Spain and the *Prior Analytics* of Aristotle. In the larger second part, which corresponds to the *Isagōgē* of Porphyry, plus the *Categories* and the *Posterior Analytics* of Aristotle,

he deals with material logic, which is a general theory of scientific demonstrations and the necessary connections they involve depending upon their content. Organized according to the three operations of the intellect (simple apprehension, judgment and reasoning) the first part treats of terms, propositions, consequences and syllogisms, along the way attending to definitions, divisions and their various facets. In the second part, John reflects upon the nature of logic itself, which he thinks is at once an art and a science. As science, he says, 'logic is essentially and absolutely in virtue of its own principles speculative, but it takes on the manner of a practical science in so far as it offers rules and direction for speculation itself' (*Ars Logica*, II q.1 a.4). The object of logic is beings of reason, such as species, genus, subject, predicate, antecedent, consequent and so on, formed by the mind's reflections upon its own operations. Such beings of reason, which have some foundation in reality outside the mind, fall under a wider notion that includes beings of reason like chimeras. These last lack such a foundation because they are impossible (that is, self-contradictory) objects. Contrasted with both sorts of beings of reason are real beings which are divided into the various Aristotelian categories (see Logic, medieval §4).

The categories are the central concern of the second part of John's logic. He rejects Duns Scotus' teaching that *ens* (being) is said univocally of the categories (see Duns Scotus, J. §5). Rather, as Cajetan (§2) thought, 'being' as said of the categories is 'formally analogous with an analogy of proper proportionality' (*Ars Logica*, II q.14 a.3). Passing through each category in succession he concurs with Cajetan's interpretation of Aquinas (*Summa theologiae* Ia.28.1) to the effect that relation is unique because it can be found in the order either of real being or being of reason. Only relation, since it is not just 'in' something but also 'towards' something, can transcend categorial status and be conceived apart from real existence either in itself (that is, the mode of existence proper to a substance) or in something else (the mode proper to an accident). This thought was to be central to John's doctrine of signs.

The doctrine of signs itself, which in part at least reflects the influence of John's Jesuit teachers at Coimbra, forms a treatise which runs over questions 21-3 in the second part of his logic. Essentially relational, signs are divided first into formal and instrumental, and second into natural, conventional and customary. All signs make something else known: formal signs (for example, a concept or an impressed species) do so without themselves first being known; instrumental signs (such as smoke or a spoken word) are themselves first known and then lead to the knowledge of something else. Natural signs (smoke) differ from conventional signs (words) inasmuch as the former simply arise from causal connections in the natural order while the latter result from human choice. Customary signs also result from choice but can be natural when a custom leads us naturally to its cause. Signs involve two non-reciprocal relations: between the sign and the significate (as in the relation of measured to measure) and between the sign and the cognitive power of a knower (as in the relation of measure to measured). Considered just as such, these relations are not in the line of physical causality but rather in that of intentionality in which the sign substitutes for the significate. Within this line of intentionality the ability of relation to transcend real being and being of reason becomes the basis of a unified semiotic doctrine respecting all signs of whatever sort they are (see Collegium Conimbricense; Language, Renaissance philosophy of §1).

3 Natural philosophy

John originally planned his natural philosophy in parts corresponding to four subject areas: mobile being in general, incorruptible mobile being, corruptible mobile being and animated mobile being. The second part, a tract on astronomy, may have existed in manuscript but was never published. The first part contains twenty-six questions principally expounding the matter of Aristotle's *Physics*. Thus after a question about the science of natural philosophy, its formal object (mobile being), its unitary character and way of proceeding, he proceeds to explain the principles of natural things (matter, form and privation). Going beyond Aristotle, he here *Naturalis philosophiae*, I q.7) discusses subsistence and existence, and he defends the Thomistic real (*a parte rei*) distinction of essence and existence in creatures. Continuing with natural philosophy, he follows Aristotle to explain nature versus both art and what is forced or unnatural, causality in general, the four basic causes (material, formal, efficient and final), motion, the infinite, place, the void and time. Near the end of this part (*Naturalis philosophiae*, I q.24 a.3) he treats Aristotle's Prime Mover. This he identifies with God whose attributes of infinity, immateriality, intelligence, ubiquity, eternity and unity he deduces from the fact that God is pure act. The third part corresponds to Aristotle's *On Generation and Corruption* and *Meteorology*. Through twelve questions on the *On Generation*, it deals with such topics as substantial generation, corruption, alteration, intension, remission, action and reaction, mixing, condensation and rarefaction, nutrition and growth. This last provokes the question:

‘How does a living thing remain the same during the whole time of its nutrition and growth?’ (*Naturalis philosophiae*, III q.9 a.6). To this John replies with Aquinas that living flesh remains the same not according to that within it which is material but according to that which is formal, that is, according to a disposition continuing over time to retain a certain figure, temperament, and order in respect of other parts and the form of the whole. The fourth part contains John’s philosophical psychology. After a brief summary of Book 1 of Aristotle’s *On the Soul*, it discusses issues raised in Books 2 and 3 about the soul in general, the vegetative soul, the sensitive soul with its external and internal sense powers, and finally the rational soul. In a more Thomistic than Aristotelian way, he defends (*Naturalis philosophiae*, IV q.9 a.1) the immortality of this last on the basis of Scripture and with two philosophical arguments. These are, first, that the operational independence of the soul from the body indicates its ability to survive the death of the body, and second, that a need for ethical sanctions here and now suggests the soul’s survival to receive reward or punishment in an afterlife (see Natural philosophy, medieval §§8-9).

4 Metaphysics

In his *Cursus theologicus* John addressed a variety of metaphysical questions about the existence, nature and operations of God. Like Aquinas (§13), he rejects the assertion that God’s existence is self-evident. Instead, a demonstration must be mounted from creatures as effects to God as their cause. In this, he retraces and explains the famous ‘five ways’ of Aquinas. He also follows Aquinas in his general deduction of the attributes of God. Distinctive, however, is his interpretation of Aquinas to the effect that it is the very act of intellection itself which is ‘formally constitutive of the divine nature’ (*Cursus theologicus*, I d.16 a.2). Also distinctive, but perhaps more a matter of updating, is John’s elaborate confrontation, here (d.18 a.4) as well as earlier in his logic (*Ars Logica*, II q.2 a.4), of the late scholastic question of whether God knows impossible beings of reason. In contrast with Vásquez, he maintains that while God may not form such beings of reason, he can know them as formed by us. Both the question itself and his discussion of it have an important bearing on scholastic intentionality teaching. Finally in his moral doctrine, yet another difference with Aquinas which John most likely saw as an updating was in his embrace of ‘probabilism’, the theory that one may resolve a moral doubt by accepting any opinion proposed by a prudent moral authority (*Cursus theologicus*, IV d.12 a.3) (see God, concepts of).

Johnson, Alexander Bryan (1786-1867)

Johnson was a self-taught philosophic genius who, completely alone, set out in the 1820s to analyse the nature and limits of language. He was the first thinker who consciously and systematically based his whole approach to philosophical problems on a critique of language. According to Johnson, a knowledge of the nature of language is important because it 'bears the same relation to all speculative learning as a knowledge of the qualities of drugs bears to the practice of medicine or as a knowledge of perspective and colours bears to painting' (1854).

Johnson tried to show that most of the propositions and questions of speculative philosophers are neither true nor false, but 'insignificant'. They arise from our 'misunderstanding of the nature of language'. He found the source of the misunderstanding in our tendency to interpret nature by language. 'My lectures', Johnson wrote, 'will endeavour to subordinate language to nature - to make nature the expositor of words, instead of making words the expositor of nature. If I succeed, the success will ultimately accomplish a great revolution in every branch of learning' (Rynin 1947: 300). Johnson's work did not attract any attention until the 'linguistic turn' in philosophy in the twentieth century made his rediscovery possible.

Born in 1786 in Gosport, England, of Dutch-Jewish ancestry, Johnson emigrated to the USA in 1801 and settled in Utica, New York, where he embarked on a long and successful career in banking. He published books on banking, on politics, and on religion and morality. However, what engrossed him most was language and philosophy. He published three books on language: *The Philosophy of Human Knowledge* (1828), *A Treatise on Language* (1836) and *The Meaning of Words* (1854). He also published two books on the theory of knowledge: *The Physiology of the Senses* (1856) and *Deep Sea Soundings and Explorations of the Bottom* (1861). In his unpublished autobiography Johnson briefly summarized what he thought his writings had accomplished:

> The verbal systems of speculative philosophy are as interminable as the different tunes that can be formed out of the notes of a piano, and realizing how barren such philosophies have ever been for the settlement of the questions for which such philosophies are employed, I have essayed the new system as an ultimate and fixed limit of all speculative knowledge; and which will in time…cause an abandonment of the old and endless speculations of the verbal philosopher.
>
> (Johnson's unpublished autobiography, date of writing unknown)

Johnson conceived of his philosophical task as that of setting limits to our knowledge: in *The Physiology of the Senses*, the limits of what we can perceive; in his books on language, the limits of what we can say; and in *Deep Sea Soundings*, the limits of what we can think. These limits are determined by the nature of reality and the nature of human beings. Human beings, according to Johnson, are physical, emotional and intellectual (he called it 'Man's Triplicity') and reality as it appears to us is divisible into three irreducible classes: the physical (sights, sounds, tastes, feels and smells), the emotional (the emotions of joy, pain, fear, awe, and so on) and the intellectual (concepts such as cause, identity, infinity, and so forth, which Johnson called 'intellections'). Johnson considered the failure to discriminate clearly these three irreducible classes the main cause of philosophical confusions.

> Properly discriminated into its organic classes, all our knowledge is free from mystery, or equally mysterious if we prefer to esteem it mysterious; but we add an unnecessary mystery at our inability to discover sensibly what is not sensible. Human knowledge can be analyzed no farther than into the organisms to which it pertains; and all attempts to delve below or beyond this boundary are founded in ignorance of the inconvertibility into each other, of the information yielded by our several organisms.
>
> (Johnson 1861: 10)

Johnson's conception of the nature and tasks of philosophy is amazingly similar to that of Wittgenstein. According to Johnson, speculative philosophers are 'misled by language', or 'deceived by the forms of language'; they 'play bo-peep with words', and their 'misuse of language' causes intellectual 'perplexity', 'amazement' and 'mystery'. Thus, Johnson's verdict on previous philosophy is: 'much of what is esteemed as profound philosophy is nothing but a disputatious criticism on the meaning of words' (1836: 282) and 'Nearly all the perplexing questions of speculation are produced by verbal equivokes… Such equivokes pass usually for profound mysteries; but all

mystery vanishes' when we understand the nature of language correctly (1854: 231-2). Like Wittgenstein, Johnson's goal in philosophy is to make philosophical problems 'vanish' or to 'terminate the mystification'.

To make all philosophical perplexities 'vanish', Johnson concentrated much of his efforts on the study of language, especially its inherent defects. On the title page of *The Meaning of Words* we find the statement: 'Four ineradicable fallacies are concealed in the structure of language: it identifies what unverbally are diverse, assimilates what unverbally are heterogeneous, makes a unit of what unverbally are multifarious, and transmutes into each other what unverbally are untransmutable'. This structural defect is one of the main causes of philosophical problems. Language consists of a limited number of words, but they are used to talk about an infinite number of things. And because we use one word to refer to many things, we assume there must be something in common among these things. As Johnson puts it, 'In all our speculation, we estimate created existences by the oneness of their name' (1836: 47). For example: 'I am speaking, I am standing, several persons are present. Each of these assertions is a truth. But if we seek among these truths for truth itself, believing it to be a unit, we are seeking a nature for what is merely a contrivance of language' (1836: 73).

Johnson used his insights on language to throw light on a whole host of traditional philosophical puzzles and in the process anticipated many ideas which became fashionable one hundred years later. For example: 'Words have no inherent signification; but as many meanings as they possess applications to different phenomena' (1836: 73); and 'If we wish to know the meaning of the word truth in any given case, we must examine the circumstances to which the word is applied' (1836: 73); another example: 'After hearing all that he can adduce in proof of the earth's sphericity, consider the prepositions significant of these proofs. If you deem it significant beyond them, you are deceived by the forms of language' (1836: 129). Similarly, a theory 'is significant of nothing but the data which are adduced in proof of the theory' (1836: 236).

Johnson, Samuel (1696-1772)

Johnson was the first important philosopher in colonial America and author of the first philosophy textbook published there. He derived his views largely from others, combining in one system elements from diverse sources. He followed the empiricists in holding that knowledge begins with sensations but held the Augustinian view that knowledge of necessary truths comes only from the mind's illumination by divine light. With Berkeley, he denied matter's existence, viewing bodies as collections of ideas. He held that these ideas are 'faint copies' of God's archetypal ideas, which he thought of in much the same way as had Malebranche and John Norris. His ethical views, influenced by William Wollaston, take happiness to be the supreme good, stressing that human beings should seek a happiness consonant with their nature as rational, immortal and social beings.

1 Life

Born at Guilford, Connecticut in Colonial America, Johnson was brought up as a Calvinist and educated at Yale in the Ramist philosophy favoured by the Puritans. At eighteen, he wrote 'An Encyclopedia of Philosophy', a compendium of learning set forth in 1,271 propositions. At this stage of his intellectual development he considered the masters of modern philosophy to be Ramus and his followers Richardson and Ames. While still a student at Yale, Johnson's outlook underwent a twofold revolution: after reading works of Bacon, Locke, Newton and John Norris, he became a keen defender of the 'new philosophers'; and after reading works of Anglican apologetics, he converted to Anglicanism and became, in 1722, a priest. During the next four decades, he produced successive versions of his compendium of philosophical learning (not all appeared in print), first revising his 'Encyclopedia' in light of his new views (1716), then composing a 'Logic' (1720), several versions of *An Introduction to the Study of Philosophy* (1731) and finally *Elementa philosophica* (1752). The *Elementa*, his most important work, consists of two parts, 'Noetica: Or the First Principles of Human Knowledge' and 'Ethica: Or the First Principles of Moral Philosophy' (the latter a revision of his 1746 *A New System of Morality*). Locke and Newton were important influences on Johnson once he was 'wholly changed to the New Learning'. But from 1730 onwards, his dominant influence was Berkeley, whom he visited during the latter's residence in Rhode Island, with whom he carried on a notable correspondence, and to whom he dedicated *Elementa philosophica*. Johnson was a founder of King's College (today Columbia University) and its first president.

2 Epistemology and metaphysics

With Locke, Johnson held that knowledge begins with 'ideas' received from the senses, ideas that are either simple (for example, red, sweet, hard) or complex (such as our idea of an apple). But he followed Berkeley in insisting that these ideas do not *represent* bodies to the mind; rather, a complex idea of sensation - for example, a certain combination of colour, shape, odour and so on - *is* a body; again like Berkeley, he held that, since bodies are combinations of ideas and ideas cannot exist without a mind that perceives them, bodies exist only if perceived.

Having got ideas from sensation, the mind, reflecting on its own operations and states, gets 'simple notions' of perceiving, remembering, willing and the like, and the complex notion of itself as a 'spirit' (mind). Self-reflection further discloses to the mind that, although it passively receives ideas from the senses, it is essentially active and capable of self-determination - a view that led Johnson to attack belief in predestination (see Predestination). From sensation and reflection we thus get notions of two kinds of being: bodies (passive beings that exist only because they are perceived) and spirits (active, perceiving beings). Only an active being can be a causal agent, so spirits are the sole true causes. We are immediately aware only of our own minds and of the ideas we perceive, but we infer, from their bodily behaviour, the existence of other finite spirits. Further, we have abundant evidence of the existence of God, the infinite spirit. (Johnson gave several arguments for God's existence, one inspired by Locke's argument in *Essay concerning Human Understanding* IV.10; one taken from Berkeley's *Principles of Human Knowledge* §§146-7; and one a version of the Augustinian argument that infers, from the existence of 'eternal and necessary truths', the existence of an eternal mind that knows them - see Augustine).

Johnson acknowledged Berkeley as his chief inspiration, but he also expressed high regard for Locke, Wollaston, Norris, Malebranche and Fénelon. By the last three he was persuaded of the Augustinian doctrine that we can know 'eternal truths' of logic, mathematics, metaphysics and morality only because God, by 'divine light', directly illuminates our 'pure intellect', disclosing to it an 'intelligible realm'. To Johnson, the doctrine that God

immediately causes our knowledge of the intelligible order seemed the complement of Berkeley's doctrine that God immediately causes our perception of the sensible order. And he found a use for Malebranche's and Norris' doctrine that there is in the divine mind an 'ideal world' - the intelligible, non-sensuous model of which the natural or sensible world is a copy. Berkeley had held that there are, in God's mind, archetypal ideas that are somehow correlated with our sensible ideas, but he never gave a very full account of his theory of archetypes, though Johnson several times, in his letters, asked him to do so. With Johnson, the doctrine of archetypes became part of a theory of representative perception: our impermanent, private sensible ideas are 'faint copies or images' that represent to us a stable, ideal world that exists, independently of our minds, in the divine mind.

3 Ethics

Happiness, for Johnson, is the 'natural good', the end all conscious beings strive for; but the happiness we seek should be consonant with our nature. Hence, ethics must begin with the study of human nature. We have senses like the animals, argued Johnson, but we also have reason; our bodies will perish after a time, but our souls are immortal; we have private interests but are also by nature social and mutually dependent. We must seek, therefore, a happiness consonant with our rational, immortal, social nature. Hedonists fall into error not in taking happiness to be our natural end but in failing to discover our true nature. These considerations led Johnson to a threefold account of duty: we have duties to ourselves, to God and to our fellow creatures. To ourselves, our duty is to pursue a kind of happiness befitting our nature; we fail in this duty if we gratify our senses at the expense of reason, temporal interests at the expense of eternal ones, private interests at the expense of public ones. Our duty to God is to love and worship him, both because we owe that to the being from whom our existence derives and because it is in his power to make us happy. To others, our duty is to increase their happiness and relieve their suffering when we can, both because reason shows us that happiness is also their natural end, and because our own happiness is bound up with theirs. One who fulfils each of these duties has the *virtues*, respectively, of temperance, piety and benevolence; one who fulfils them all has the virtue of justice, rendering to all persons what is their due.

Elementa philosophica was the philosophy textbook used at the colonial colleges that became the University of Pennsylvania and Columbia University. With his pupil Jonathan Edwards, Johnson was one of the earliest American defenders of idealism, a species of philosophy that, in one form or another, has been a recurring motif in American thought.

Locke, J. (1689) *An Essay concerning Human Understanding*, ed P.H. Nidditch, Oxford: Clarendon Press, 1975. (Johnson's early 'Logic' closely followed the Essay's account in Book 2 of the origin and kinds of ideas, and in Book 4 of the degrees of knowledge and of probable assent. The Essay's influence is still evident much later in *Elementa philosophica*.)
Schneider, H.W. (1958) *The Puritan Mind*, Ann Arbor, MI: University of Michigan Press.(Chapter 5 contains a good account of Johnson's development by a leading historian of American philosophy.)

Johnson, Samuel (1709-84)

Famous as a man of letters and lexicographer, Johnson was no formal academic philosopher - indeed he was suspicious of abstractions. His works perfectly embody the darker side of the eighteenth-century mind, with its distrust of theoretical reason and system-mongering, and a profound sensitivity to the imperfections of a human existence in which there was more to be endured than to be enjoyed.

Born on 18 September 1709 in Lichfield, Staffordshire, the child of ill-matched parents, Samuel Johnson was a sickly child. At the age of three he was taken by his mother to Queen Anne in London to be cured of a scrofula through the ‘royal touch’.

He matriculated at Pembroke College, Oxford, but poverty forced him to leave after only two years. For the next two decades his life was a struggle with penury and with psychological traits (awkwardness, anxiety, anger) that left him prey to melancholy, and which manifested themselves in a profusion of personal eccentricities. His melancholy coloured his views of human nature and destiny. A pious, even superstitious Anglican, he found little solace in a faith that left him with a profound sense of the misery of human existence in general, and of his personal shortcomings and culpability.

Having moved to London in 1737, he obtained employment on the *Gentleman’s Magazine* as a parliamentary reporter and hack writer. His poem *London*, a satire on the great city, appeared anonymously in 1738. In 1747 he was commissioned by London’s main booksellers to prepare a *Dictionary of the English Language*, in two volumes. It was eventually published in 1755. Johnson had no belief in any such thing as an ideal language; nevertheless, in his view it was one of the lexicographer’s duties to regulate and stabilize language.

Meanwhile in January 1749 he published *The Vanity of Human Wishes*, an imitation of the tenth satire of Juvenal and an expression of his own vision of human folly. Around the same time, his tragedy, *Irene*, was finally staged by his erstwhile pupil, David Garrick.

About a year later, he began to publish *The Rambler*, a magazine in the manner of the *Spectator* containing short essays on morals, manners and literature. This was followed in 1758 by *The Idler*. Johnson’s essays were sober, moralistic and instructive, commenting insightfully on human failings. In the meantime, he published a review of Soame Jenyns’ *A Free Enquiry into the Nature and Origin of Evil* (1757). Jenyns had argued, in a rather Leibnizian way, in favour of the doctrines of cosmic optimism and plenitude: all evils (for example, illness and disability) were only apparent, part of a larger scheme of benevolence created by a superfecund Deity. Johnson countered that Jenyns’ views were specious rationalizations that trivialized pain and suffering and discredited philosophy.

Meditations on malevolence and the vanity of human wishes formed the core of Johnson’s only extended work of fiction, *Rasselas*, published in 1759. Its protagonists, Rasselas and Imlac, Nekayah and Pekuah, leave their ‘happy valley’ in Abyssinia to see the world, but find only suffering, pride, fatuity and self-deception in a series of exploits that parallel *Candide*, the contemporary work by Voltaire. Johnson’s work ends in a ‘Conclusion, in which nothing is Concluded’. For rather traditional Christian reasons, Johnson could not easily subscribe to Enlightenment notions of human goodness and progress.

From the 1760s, Johnson was befriended by the Scot James Boswell. Thanks to Boswell, Johnson is remembered as a conversationalist, famous for his trenchant, peremptory, but often deeply humane, sentiments.

In the 1770s Johnson wrote as a political polemicist, first in defence of the British title to the Falkland Islands, and then on the side of the Crown in the dispute with the American colonies. *Taxation no Tyranny* shows Johnson as an authoritarian Tory, though in his off-the-cuff remarks he often supported the underdog against authority. In 1765 his edition of Shakespeare had appeared; the first four volumes of the *Lives of the Most Eminent English Poets* were published in 1779, the remaining six in 1781.

ROY PORTER

List of works

Johnson, S. (1750-52) *The Rambler*, London: Payne & Bouquet; ed. W.J. Bate and A.B. Strauss, New Haven, CT: Yale University Press, 1969, 3 vols.(Magazine containing short essays on morals, manners and literature.)
Johnson, S. (1755) *A Dictionary of the English Language*, London: Strahan, 2 vols.(Not, as sometimes imagined, the first major English dictionary, but the first with copious instances from literature of the proper use of the words in question.)
(1757) 'A Review of Soame Jenyns' *A Free Enquiry into the Nature and Origin of Evil*', in B. Bronson (ed.), *Samuel Johnson, Rasselas, Poems and Selected Prose*, San Francisco, CA: Rinehart Press, 1971, 219-28. (Johnson's attack on Jenyns was perhaps the most biting and devastating attack on the vacant moral optimism in fashion in the mid eighteenth century.)
(1758-60) *The Idler*, London: Newbery; ed. W.J. Bate, J.M. Bullitt and L.F. Powell, New Haven, CT: Yale University Press, 1963.(Together Johnson's *The Rambler* and *The Idler* essays take the form of the brief essay earlier pioneered by Addison and Steele and give the genre an altogether more serious moral twist.)
(1759) *The Prince of Abissinia: A Tale*, London: Dodsley; repr., ed. J.P. Hardy, Oxford: Oxford University Press, 1988.(Popularly known today as *Rasselas*. Rightly regarded as the English equivalent to Voltaire's exactly-contemporaneous *Candide*, Johnson's moral tale poses the question of the choice of life before ending with a conclusion in which nothing is concluded.).
(1779-81) *The Lives of the Most Eminent English Poets*, London: Bathurst; repr. ed. A. Waugh, London: Oxford University Press, 1952.(Johnson's book helped to establish the 'canon' of great English poetry while offering sometimes provocative judgments, as with his rather negative verdicts on Milton.)
(1968) *Selected Writings*, ed. P. Cruttwell, Harmondsworth: Penguin.(Includes Johnson's 1738 poem *London*, published anonymously and his *Vanity of Human Wishes* of 1749.)

Journalism, ethics of

It is sometimes suggested that ethical principles, even fundamental ones like nonmaleficence and beneficence, are totally out of place in journalism, and that it should be shaped solely by market forces. This suggestion should be resisted. One reason why journalism should be ethical is that in a democracy it is expected to serve the public interest, which means that it should accept the responsibility to circulate the information and opinion without which a democracy could not operate, and to enable it to do this the freedom of the press is acknowledged.

If journalism is to serve the public interest, then a commitment to truth-telling is fundamental. Journalists should also be fair and accurate in reporting news, should publish corrections, should offer a right of reply. They should avoid discrimination, deception, harassment, betraying confidences and invasions of privacy. But ethical journalism is more than lists of requirements and prohibitions. In investigative journalism, for example, some deception or intrusion into privacy could be justified in order to uncover corruption. Ethical journalism is therefore reflective understanding of the underlying principles of harm and benefit and the public interest, and an ability to apply them in particular cases.

1 The very idea of ethics in journalism

There are good reasons why journalism should be regarded as a practice governed by ethics, but also good reasons why this is problematic. It is expected of any group of practitioners who aspire to professional status that they base their practice in ethics, often by adhering to an explicit code of practice that specifies the expected behaviour in accordance with an acknowledged set of ethical principles ruled by the twin principles of nonmaleficence (do no harm) and beneficence (do good) (see Professional ethics). Those in breach of the professional code may be penalized in some way, with expulsion from the profession as the ultimate sanction. Clear examples are regulated professions like medicine, nursing, social work, law and teaching, in which the practitioner provides care or service for the client (patient, student) with individual and identifiable needs (see Medical ethics; Nursing ethics).

But can journalism be fitted into this model? Whereas it is easy to say that journalism too should be governed by nonmaleficence and beneficence - because these principles are all-encompassing - it is not so easy to see further analogies between journalism and the traditional professions, for two related reasons.

First, journalism is not a regulated profession, and perhaps not a profession at all: anyone who can get a relevant job in the media industry is a journalist. Second, even if it is a profession, journalism is certainly not a ‘caring’ profession with individual ‘clients’, but an occupation that takes place within a very competitive commercial framework. Journalists increasingly work for organizations which seek power and profits, and which are concerned with quantitative measures like audience figures and advertising revenue rather than with qualitative issues of ethics.

As a result the professional advancement of journalists depends (with rare exceptions) not on their adherence to ethical principles but on their contribution to the commercial success of their organization. Indeed, the ‘scoop’ is all, so success is more likely to follow from ignoring ethical considerations like confidentiality or privacy. This leads to the sceptical claim that there simply is no place for ethics in journalism. Even the principles of nonmaleficence and beneficence would be ludicrously out of place, because on this view journalism is motivated and shaped solely by market forces (see Market, ethics of the).

2 Journalism and democracy

But before the irrelevance of ethics to journalism can be confirmed, we need to look at the traditional political justification of ethical journalism, as this is ignored rather than refuted by the sceptics.

Liberal theory places a high value on freedom of thought and freedom of speech (see Freedom of speech). One argument for this is in terms of *rights*: rational individuals have a right to think as they find and to speak as they think. Another argument, due especially to Mill, is in terms of *consequences*: truth is beneficial to individuals and society, and it is most likely to be arrived at through free expression and open discussion, through the unfettered critical clash and contention of ideas (see Mill, J.S. §12).

Democratic theory adds to these goals and arguments (see Democracy). An informed citizenry is a necessary

condition of democracy, and this gives the media their special role with both rights and responsibilities. The rights are the privileges of press freedom, and the responsibilities are the duties to provide the accurate information and balanced comment without which people cannot fulfil their roles as rational citizens.

This link between free speech, freedom of the press and liberal democracy famously appears in the First Amendment to the Constitution of the United States of America: ‘Congress shall make no law…abridging the freedom of speech, or of the press’. It has since become enshrined in international charters such as the Universal Declaration of Human Rights: ‘Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media regardless of frontiers’ (Article 19).

To the extent that there is anything in this democratic justification of journalism, the abandonment of journalism to market forces must be rejected, and journalism emerges as an ethical practice. This is because it can serve the required democratic role only if it constitutes itself on the basis of ethical concepts like truth, objectivity and fairness. Journalism which is ethical in this sense rejects a purely commercial ethos and recognizes a commitment to serving the public interest.

The more specific principles of journalistic ethics, concerning objectivity, confidentiality and the like, follow from this overall commitment that journalism should do no harm to but should further the interests of a democratic polity and its individual citizens. Although there is scope for a legal framework on such matters as defamation, obscenity and privacy, legislation has a merely restrictive effect on freedom of expression and does not actively promote journalism of high quality. It is ethical engagement by journalists, and not legally backed censorship, which is a necessary condition of journalistic quality.

3 The ethics of journalism

Although ethical issues in journalism can be classified in various ways, the most straightforward is to distinguish between what is ethically required and what is forbidden. (This is not, however, an absolute distinction, and some injunctions, depending on how they are worded, can be in either category.)

On the side of what is required, it follows from the democratic justification that truth is fundamental, and this leads to the often-made claim that truth-telling is constitutive of journalism (see Truthfulness). Therefore, honesty and accuracy in presenting factual information is required, and, since no one is free from error, a commitment to publish corrections and to offer a right of reply to those who are criticized. In practice it is not as simple as this, as there is often no agreement about what is a factual matter or about what the facts in a particular case are, and a right of reply could easily be abused by anyone with a trivial complaint against the press.

There is also the problem that although journalists might have a commitment to the truth and nothing but the truth, it is impossible to publish the whole truth. Selection of material is always necessary, and so further principles like objectivity and impartiality, fairness and balance, are called up. It follows that there is never an algorithmic solution to ethical problems in journalism. The broad principles of honesty, objectivity, fairness and the like require both further specification and detailed consideration in the context of particular cases, and journalists must exercise ethically-informed judgments in the light of a commitment to the public interest.

The difficulties are compounded if we turn from factual journalism to comment and opinion, and especially to political journalism. Whereas public service broadcasting is expected to conform to the principles of impartiality and balance, the commercial press normally has a political commitment or ‘bias’. There is nothing wrong with individual journalists being partisan so long as they are honestly and openly partisan, but when does partisanship become manipulation or propaganda? And to what extent do editors have a responsibility to try to ensure that all varieties of opinion are represented in their paper? To what extent does the press as a whole have such a responsibility? It is in this area that the ethical ideals that lie behind the democratic justification of press freedom are diminished by commercial realities.

What is ethically forbidden in journalism includes sexism, racism and other forms of discrimination, deception, harassment, invasions of privacy, exploiting children who are in the news, and buying the stories of criminals (see Discrimination). Again, in practice these prohibitions are problematic, and a good deal of reflection on fundamental principles of good, harm and the public interest is required.

This is so especially in the area of the relations between journalists and their sources or potential sources. The confidentiality of willing sources, including whistle-blowers, should be respected, but investigative journalism presents special difficulties. Journalists often want to find out things which those who are involved prefer to keep hidden. Investigative journalism is part of the truth-telling function of journalism, and journalists have a responsibility to uncover scandal and corruption, especially where harm is being done to innocent victims. So investigative journalism can serve the public interest, and in doing so there may be justification for some deception or intrusion into privacy. But where in such cases to strike a balance is the most difficult issue in the ethics of journalism.

Privacy is especially problematic. Whereas it is easy to agree that journalists should not invade privacy, it is not at all easy to draw a satisfactory boundary between private and public (see Privacy). The truly private citizen who lives a life of public insignificance is in little danger from intrusive journalists, but sometimes such citizens are forced by good fortune (winning a lottery) or bad (being a disaster victim) into the public eye. In such cases requests for privacy should be respected and harassment frowned on. There is a difference between the public interest and what the public is interested in.

But should public figures in politics, business, entertainment, sport, be entitled to privacy? There is more than one issue involved here. Many such figures choose to live by publicity and are not in a morally strong position to object if the publicity is not exactly what they want. But are politicians, for example, entitled to a private life? The usual answer is to say that those areas of their lives that do not affect the performance of public duties are properly private, and that therefore financial scandals can legitimately be exposed in the media, but not sexual scandals. But it is doubtful whether this distinction, which involves dividing one person into two separate parts, the private and the public, is satisfactory on psychological or ethical grounds. And there is a further problem, in that appeals to ‘privacy’ can be question-begging. Investigative journalism often shows that what the corrupt politician claims is private is not private at all but is legitimately a matter of public concern.

What this brief survey of ethics in journalism shows is that there are no easy answers. Although it is possible to talk of what is required and what is forbidden in ethical journalism, more than a list of positive and negative injunctions is necessary. This is one reason why various formulations of codes of practice for journalists have not proved satisfactory. What is needed is a rational understanding of the underlying principles of harm and benefit, of individual rights and the democratic public interest. What is needed is the incorporation of reflective ethical practice into journalism, so that, as Klaidman and Beauchamp so well express it (1987), every journalist becomes ‘the virtuous journalist’.

Judah ben Moses of Rome (*c*.1292-after 1330)

Judah Romano, translator and Maimonidean philosopher, participated in the intellectual climate of Latin scholasticism, introducing a large number of the ideas of the Christian philosophers into Hebrew. He gained his knowledge in the various branches of philosophy through meticulous study of the writings of Aristotle and the scholastic commentaries to his works (particularly those of Albert the Great, Aquinas and Giles of Rome), of the Maimonidean-Tibbonian school, and of some Arabic philosophical treatises in Latin translation. Influenced by Albert the Great, Aquinas and Maimonides, he discussed all the major philosophical topics, and especially the idea of creation through intermediaries, the origins of the human soul, the cognitive process, which represents the real purpose of man, the nature of prophecy and prayer.

1 Creation

Judah may well have held an official position at Naples, at the court of Robert II of Anjou. Since Robert was then Senator of Urbe, one cannot exclude the possibility that he actually worked in Rome. The terminology of his exegetical writings almost entirely Aristotelian, but Judah fuses Aristotle's doctrines with others of Neoplatonic origin. His *Be'ur Ma'aseh Be-re'sit (Commentary on Genesis)* interprets philosophically the verses which open the Bible and argues that the creation cannot be proven apodeictically. Judah adopts the doctrine of creation through intermediaries: creation is seen as a process of emanation from the First Cause. The first emanation is light, identified with existence, which is the first perfection of a being (see Neoplatonism).

Judah goes on to develop a fully-fledged metaphysics of light and to discuss a number of astronomical questions regarding such as matters as the stellar motions, the positions and dimensions of the planets, and solar and lunar eclipses. The First Cause is called the subsisting Being. It is the simplest being, differing from created beings, which are compounded of essence and existence (in the case of the separate Intelligences) or of matter and form (in the case of the creatures of the sublunar world).

Judah also expounds on the creation of the vegetative, sensitive and rational souls, following the approach of Albert the Great: the rational soul represents the ultimate and most elevated degree of a dynamic process which starts from the active element, present in the potentiality of the prime matter. The creation of the rational soul, unlike that of the vegetative and sensitive souls, the causes of which are organic and natural factors joined to celestial virtue, takes place as a result of the direct intervention of the First Cause, through the influence of the 'active intellect'. It is because of the intellect, which is the substantial form of man, that man belongs to the superior world of the Intelligences. It is for this reason that man is said to be created 'in the image of God'. In agreement with Moses Maimonides, and contrary to the teachings of the Latin scholastics, Judah does not hold the active intellect to be the active element intrinsic in the the human rational soul, but rather the tenth separate Intelligence.

Adam, once created and endowed with an intellect capable of receiving the *intelligibilia*, was put under the dominion of the active intellect. Knowledge attained with the aid of the active intellect represents the ultimate purpose of man. Even after the expulsion from Eden, the purpose of man is to devote oneself to the *intelligibilia*, in order to be able to conjoin oneself with the active intellect in the highest degree of the cognitive process.

2 Prophecy

In *Sa'arim (Gates to the Books of Prophecy)*, Judah fuses Maimonides' and Aquinas' doctrines of prophecy, claiming for prophecy the character of a science on a par with other philosophical disciplines (see Aquinas, T.). He analyses its properties and assigns to it the peculiarities attributed by the Latin scholastics to theology, at the service of which the secular sciences are placed. The science of prophecy, which emanates from God's knowledge, differs from the natural sciences by its supernatural source of inspiration. It is the most elevated among the intellectual and ethical sciences with regard to veracity. The content of some prophetic revelations is superior to that of metaphysics, the highest science, although its final purpose, the ultimate realization of the human being, is not superior to that of ethics. Prophetic revelations were necessary in order to reveal supernatural truths to humanity. as well as certain natural truths, which would otherwise have remained concealed from the majority of mankind.

Judah analyses the content of the prophetic revelations and the purpose and nature of prophecy. He reaches a conclusion at a middle position between that of Maimonides and that of Aquinas: the prophet is a philosopher, prepared in all the branches of knowledge, whose rational and imaginative faculties are perfect. The preparation of the prophet is a prerequisite for prophecy, but prophecy is not a purely natural phenomenon. Some prophecies are natural and others miraculous: in the natural revelations the prophet perceives the content of the revelation, which is similar to that of the various branches of science, by means of a cognitive intellectual-imaginative process. The content of the miraculous revelations, however, surpasses human capacities, or the prophetical cognitive process takes place without the mediation of the imagination.

Prophecy consists of: (1) intellection, (2) transmission of the prophetic message to others (3) the performing of miracles. Only the first element, however, is necessary; by means of the other two elements, the prophet functions as a guide. For Judah, influenced by Maimonides, prophecy is an inspiration from the First Cause, through the mediation of the active intellect, to the intellect and then to the imaginative faculty of the prophet (see Prophecy).

3 Prayer and the universe

In *Be'ur ha-Qaddis we-ha-Qedusah (Commentary to the Liturgy),* Judah interprets philosophically the key-words of prayer, using the *Liber de Causis (Book of Causes)* as his guide. The First Cause is the universal, infinite, most simple and transcendent cause, beyond all definition; all beings, according to their nature, are influenced and 'preserved' by it. The universe is organized hierarchically, and the world of the Intelligences exerts a real causal impact on the sublunar world. The First Cause is the cause of eternity; the Intelligences are eternal - that is, timeless and motionless - and the human soul, identified by Judah as the 'noble soul', belongs by nature to the eternal intellectual world, although operating within time.

Through a rationalistic analysis in which he is influenced by Aquinas, Judah discerns two components of prayer: (1) the uplifting of the human intellect to God by means of the cognitive process and (2) the 'request of suitable things': the content of the prayer expresses the agreement of the will of the human being with his intellectual representation, whereby the individual renders his words ('the external language') suitable and asks God for suitable things. Through prayer supplicants reach the point where their intellect conforms to the divine will and, thanks to the perfection of their intellection, are the cause of the acceptance of their own prayer. Concerning the distinction between individual prayer and public prayer, Judah asserts that the former is not necessarily expressed in words: for one who has reached a high level of perfection, prayer is an intellectual act, superior to any form of prayer expressed by means of the voice. Individual prayer, in its most elevated expression, is then a cognitive and contemplative act. Public prayer, however, is necessarily 'vocal', since the officiant in the synagogue prays for the whole community. Such prayer has the 'political' function of strengthening the faith of the masses.

Following Albert the Great, Judah stresses repeatedly that the individual must advance gradually in the acquisition of the *intelligibilia*, in order to achieve the highest level of intellection. The most elevated intelligible concepts are, in fact, God and the separate Intelligences. The real purpose of man is to 'purify' his intellection. This purpose can be partially realized starting in this life, while the soul is united to the body. It is completely attainable, however, only in the hereafter. Then the human rational soul, free from corporeal bonds, will unceasingly enjoy the *intelligibilia* gleaned during this life. This will constitute its eternal happiness. For its condition, at that point, will be like that of the separate Intelligences.

Jung, Carl Gustav (1875-1961)

Jung was among the leaders in the development of depth psychology at the beginning of the twentieth century. An early follower of Sigmund Freud, he broke with the founder of psychoanalysis in 1913 and established his own school of analytical psychology.

Jung's theoretical development originated in his work on the word association test and the theory of feeling toned complexes. As he continued to explore the workings of the unconscious, he postulated the existence of instinctual patterns of cognition and behaviour which he termed 'archetypes'. Archetypal patterns are, according to Jung, common throughout the human species and constitute an inherited 'collective unconscious'.

Jung's approach to psychology was eclectic. He accepted the psychological importance of any phenomenon, even if it conflicted with current thinking in other fields. This attitude led to a deep investigation of the psychological significance of occult phenomena and alchemy, which Jung viewed as expressions of the unconscious that anticipated modern psychology. Later in life, Jung turned increasingly to considerations of the contemporary cultural expressions of psychological forces, writing extensively on what he viewed to be a deepening spiritual crisis in Western civilization.

1 Early work and relationship with Freud

Jung's father was a Protestant minister and Hebraist, while his paternal grandfather had been a distinguished physician and university reformer. On his mother's side, Protestant theologians predominated. Given this milieu, Jung was exposed, from an early age, to the main currents of nineteenth-century theology and philosophy, most notably the works of Kant, Schopenhauer and Nietzsche. Jung attended gymnasium in Basel and went on to medical school at the University of Basel. Following graduation, he undertook postgraduate training in psychiatry at the Burghölzli Hospital in Zurich, under the direction of Eugen Bleuler. At about the same time, Jung married Emma Rauschenbach, the daughter of a wealthy German industrialist. They had five children together. From 1906 to about 1913, Jung was deeply involved with Sigmund Freud in the development of psychoanalysis. Following their break, Jung undertook to develop his own theories about the workings of the psyche. The theory of archetypes and the collective unconscious, for which he is best known, prompted Jung to travel widely, after the First World War, in search of evidence to support his understanding of the commonality of psychological functioning throughout the species. In the 1930s, Jung was briefly in contact with figures connected to the National Socialist takeover of German medicine. He soon broke contact, however, and deeply regretted having had any relationship with them.

Jung was surrounded, throughout his adult life, by a large circle of students and admirers. Eventually, this circle developed into the C.G. Jung Institute at Kusnacht, outside Zurich, where Jung had his home.

Although Jung is best known for his theories of the archetypes of the collective unconscious, he first attracted international attention for his work on the word association test. The test was conducted by reading off a list of stimulus words and noting the characteristics of the responses on the part of the subject. Jung significantly refined the measurement of the anomalies in association, such as delayed response, cardiopulmonary function, and galvanic skin response. These refinements allowed for more precise interpretation of test responses. Out of this experimental work, but also under the influence of Pierre Janet in France and Théodore Flournoy in Switzerland, Jung developed the theory of 'feeling toned complexes', or affect-laden automatisms within the larger psychic structure of the individual. This theory formed the foundation for all subsequent developments in Jung's system of psychology.

The refined word association test provided the first experimental evidence supporting Sigmund Freud's theory of repression. In 1906, Jung wrote to Freud, sending copies of his most recent work on the test, only to learn that Freud already had the papers. Thus began one of the most famous and ill-fated collaborations in modern science.

Although a host of factors contributed to the eventual break between Jung and Freud, several points of theory distinguished the two from the beginning. Freud based his work on a definition of libido that was exclusively sexual in nature, and the conviction that psychopathology derived from infantile sexual conflicts. The task of psychoanalysis was to uncover the sexual etiology of the disorder and thereby dissipate its effect. Jung's work

with the association test, however, had convinced him that libido was not exclusively sexual and that not all complexes could be reduced to a single etiologic source.

Other points of theory further separated the two. Based on work done in his doctoral dissertation on a case of somnambulism or mediumship, Jung argued that at least some of the workings of the unconscious were motivated by the anticipated development of the individual. This teleological view of the unconscious prompted Jung to question the role of *repression*, which for Freud was the fundamental mechanism of psychodynamics, in the psychic economy. For Jung, *projection* of psychic contents from the unconscious, without prior repression, took on increasing significance. Finally, based on his extensive experience with dementia praecox (schizophrenia) at the Burghölzli hospital, Jung concluded that there were what he termed ‘psychological dominants’ at work in all individuals, and that these dominants were evolutionary in origin, and relatively consistent throughout the species. Although Freud believed that the Oedipus complex was common throughout humanity, he resisted the notion that there could be other complexes with equal status.

2 The theory of archetypes and personality theory

Following the break with Freud in 1913, Jung went into a period of self-analysis and theory building. At this time, Jung developed his method of active imagination which used the images presented in dreams and waking reveries to explore the individual psyche. Out of this work with the imagination he developed his characteristic vocabulary for the structure of the psyche, and his more refined understanding of the psychological dominants, now referred to as ‘archetypes’. The consciously presented personality was referred to as the ‘persona’, from the mask worn by actors in the ancient Greek theatre. Those parts of the personality that were not allowed into conscious presentation formed the individual’s ‘shadow’.

In addition to persona and shadow, Jung posited the existence of images of the counter-sexual in both men and women. These he referred to as ‘anima’ and ‘animus’, respectively. The images of the counter-sexual formed a bridge between the individual unconscious and the ‘collective unconscious’ which contained the archetypes. The term collective unconscious refers to the inherited instinctual substrate of human psychological functioning.

The theory of archetypes has been the subject of various interpretations, and Jung was not always precise in his application of the term to a psychological event. One common misconception, however, is that Jung thought of the archetypes in purely Platonic terms, as existing in some transcendent realm of ideas. Much of the confusion arises from a failure to recognize Jung’s distinction between *archetypes* and *archetypal images*. Although there are places where Jung appears to discuss the archetypes in transcendental terms, perhaps informed by his extensive reading of Kant, his most consistent position is that the archetypes are biologically inherited, instinctual patterns of cognition and behaviour. It is this level of shared cognitive and behavioural patterns that constitutes the *collective unconscious*.

‘Archetypal images’, on the other hand, are more or less conscious representations of the archetypal or instinctual structures. Thus, instinctual seeking of the breast in the new-born infant demonstrates an archetypal form of behaviour associated with the mother. The instinctual relationship to the mother, however, also drives the formation of individual fantasies and images representative of the infant’s experience of the mother, and the culture at large contributes to the further elaboration of these fantasies by means of myths, rituals, fairy tales and other forms of collective representation associated with the mother.

Jung was also at work on a theory of personality or ‘psychological types’. Jung posited two essential orientations toward the world, introversion and extroversion, to which were added the functions of thinking, feeling, intuiting and sensing. In essence, the extrovert focuses on the outside world for information and inspiration, while the introvert focuses on interior states. By the same token, the functions are paired in such a way that one operates consciously while the other works unconsciously. Thus a thinking type will have an unconscious feeling function that attaches itself to contents of the unconscious.

3 Occultism, alchemy and projection

Jung had a lifelong interest in occultism and esoteric traditions. He was by no means alone in this interest, as research on spiritualism was widespread at the time. Jung and Freud both met with William James during a trip to the USA in 1909, and James came away deeply impressed by Jung, in part, no doubt because of their shared

interest in spiritualism. For his part, Jung considered James to be a profound influence on his development.

Interest in how causally unrelated events could be meaningfully connected, as when a series of numbers seem to repeat themselves several times during a single day, led Jung to develop his theory of synchronicity. As with many of Jung's theories, it is difficult to distinguish empirical research from the formulation of a theory of psychological functioning. Thus, on its surface, the theory of synchronicity attempts to provide statistical measures of some paranormal phenomena. By and large, however, these measures are not significant. On the other hand, the role of projection in the formation of meaningful associations is clearly demonstrated. This understanding of the primacy of projection in psychic functioning laid the foundation for the development of such standard projective tests as the Rorschach and the Thematic Apperception Test (TAT).

Jung's long-standing fascination with esoteric traditions, particularly Gnosticism (see Gnosticism), led him into an extensive study of alchemy. Alchemy was not, on Jung's reading, a precursor to modern natural science. Rather, it was essentially a Western form of psychological and spiritual discipline resembling the great meditative traditions of India and East Asia. The operations of the alchemists in their work and writings were manifestations of psychic projection, and the search for a means to transform base metals into gold was a spiritual quest for self-perfection (see Alchemy).

The investigation of projection eventually led Jung to consider the epistemological implications of his system of psychology. To the extent that projection from the unconscious informed his interpretation of cognitive phenomena, it became increasingly difficult to maintain a purely empirical view of those phenomena. In the end, Jung spoke of a 'psychoid world' where the boundaries between psychic events and objective reality break down.

4 The critique of culture

While implicit in some aspects of his early work, Jung's late work (1939-61) focused increasingly on what he saw as a crisis in Western civilization. In many respects, Jung's critique resembles those of Husserl and Heidegger, although it focuses more on issues of spiritual collapse and renewal. Additionally, Jung thought that it was possible to assume a therapeutic stance in relation to the cultural crisis.

Jung focused his critique of culture, to a substantial degree, on the historical role of Christianity. He approached this problem from within the frame of his psychological theories, however, rather than from either a historical or theological standpoint. This meant that the body of historical and textual materials that make up the Christian tradition were treated, by Jung, much as he would treat the dreams and fantasies of a patient. Jung viewed the tradition as increasingly maladaptive, and therefore in need of therapy. At the same time, he viewed such doctrinal moves as the proclamation of the bodily assumption of the Virgin as attempts to overcome maladaptive aspects of dogmatic Christianity by incorporating previously denigrated aspects of human experience such as the female body.

Jung exercised an influence on the practice of psychotherapy and on fields ranging from literature to industrial psychology that far exceeds what is usually recognized. The circumstances surrounding his break with Freud, as well as his brief association with the Nazis, did considerable damage to his reputation. An idiosyncratic vocabulary added to his image as an undisciplined thinker. Nevertheless, his system of psychology, beginning as it does with the word association test, and emphasizing the biological foundations of cognition and behaviour, thereby anticipating more recent developments in cognitive theory and evolutionary psychology, rests on far stronger empirical foundations than most other depth psychologies.

Jungius, Joachim (1587-1657)

Joachim Jungius was one of the most important seventeenth-century reformers of Aristotelian logic. Through critical assessment of Suárez and by recourse to Ramus, Zabarella and Melanchthon, he tried to replace Aristotelian syllogistics with a logic based on empirical judgment. This differed sharply from other contemporary attempts to reform logic in Protestant Europe. Jungius was a pioneer in the development of the modern concept of 'element' in chemistry, and made an important contribution to the classification of plants.

1 Life and works

As a schoolboy in the German city of Lübeck, Jungius showed his exceptional talent by teaching his classmates the dialectic of Petrus Ramus. Thus in 1606, when he began to study logic and metaphysics in Rostock, his stance towards the neoscholastic system of Suárez and the logic of Coimbra was already influenced by his thorough knowledge of Ramus (see Collegium Conimbricense). Soon he turned to mathematics and continued his studies at the recently-founded University of Giessen, receiving a Master's degree in 1608. Having taught there as a professor of mathematics, he moved back to Rostock in 1616, began to study medicine, and - after a scholarly tour through Europe - qualified as *Doctor medicinae* in Padua. There he worked mainly on botany and zoology before returning to Rostock in 1619. He joined Johann Valentin Andreae's circle and helped to found the *societas ereunetica/zetetica* (*c*.1623). However, this society lasted only until 1625 because of the Thirty Years' War. Its aims were on the one hand the rejection of Jesuit metaphysics and the critique of sophistics, on the other the promotion of mathematical studies and a natural science regulated by observation and experience. The relation between *ratio* and *experientia* should be determined in such a way that the sciences could be based on demonstrable certainty. After professorships in mathematics in Rostock (1624) and medicine in Helmstedt (1625), work as a doctor in Braunschweig and return to his professorship in Rostock (1626), Jungius took up simultaneously the rectorships at the Johanneum and the academic *Gymnasium* in Hamburg. Disputes with the politically influential Lutheran orthodoxy about the style of New Testament Greek forced him to retire as rector of the Johanneum in 1640.

Jungius did not publish much during his lifetime, but his ideas were promoted to a certain extent by Comenius and by the British mathematician Charles Cavendysshe. His immediate influence was in part based on the disputations and dissertations he supervised when rector at the academic *Gymnasium* (for example on stoicheiometry, doctrine of physical principles, theory of motion and other subjects). In 1691 all but about a quarter of Jungius' originally voluminous posthumous papers were destroyed by fire (Meinel 1984b).

2 *Logica Hamburgensis*

Written in the early 1630s as a textbook for the academic *Gymnasium*, the *Logica Hamburgensis* is based on the idea of a continuous improvement of the sciences. In this respect it directly follows Francis Bacon's concept of science and the pedagogical-utopian ideas of Johann Valentin Andreae (see Bacon, F.). According to Jungius, one can discern a progress in the sciences despite the Deluge, the migration of nations and the Thirty Years' War, and this progress is due to the improvement of logic. As the editor of the second edition explained, the aim of the *Logica Hamburgensis* was to complete and amend Aristotelian logic - a very accurate description of the syncretistic character of Jungius' logic, which links up conceptually with Zabarella's definition of logic as 'habitus mentis organicus (instrumentalis)' (see Zabarella, J. §2) and with Ramus' concept of logic as the art of proper reasoning. Accordingly, the structure of the *Logica Hamburgensis* follows the Ramistic distinction between *inventio* and *iudicium* which Jungius relates to the three activities of the human mind, namely (1) *notio* or *conceptus*, (2) *enuntiatio* and (3) *discursus* or *ratiocinatio*. Following this basic structure, Jungius deals in the first three books (*Logica generalis*) with the doctrine of the predicables (*De notionibus*), the doctrine of the predicables' modes of expression (*De enuntiatione*), and finally their application to syllogistic figures (*De ratiocinatione*). Books 3 to 6 (*Logica specialis*) deal with the range of our a posteriori cognition within the limits of apodictic certainty (*Logica apodictica*), with dialectics, and sophistics (particularly the theory of fallacies). Given this heterogeneous internal structure, the merit of the *Logica Hamburgensis* lies certainly in its strongly epistemological concept of logic and the value it ascribes to empirical concepts. Although Jungius' logic was sometimes harshly criticized for its attempt at a moderate reform of Aristotelian syllogistics, it remained the basis

for the teaching of logic at the academic *Gymnasium* in Hamburg for many decades and even influenced Leibniz's studies of logic.

3 Writings on natural history

Jungius' writings on natural history, based on lectures and published posthumously, are of an even more didactic nature than his logic textbook. Unlike Descartes, who had tried to found philosophy anew seemingly without any presuppositions, Jungius apparently thought that progress in philosophy through the study of nature could be achieved only by examination of traditional doctrines. By critically assessing the physics of Zabarella, Jean Fernel, Daniel Sennert and others, Jungius defined natural science in the *Doxoscopiae physicae minores* (1662) as a mode of cognition which does not adjust the phenomena to preconceived opinions but the hypotheses to the phenomena. In the Aristotelian-Theophrastic-Galenic tradition, on which he explicitly based his methods, he replaced - in contrast to the metaphysics of Coimbra - the question of the essence of things with that of their function and mode of action. According to Jungius, the natural scientist does not define 'change' or 'motion', but rather what it means 'to be changed' or 'to be moved'. Therefore he focused on the concept of a *materia substantialis* which, together with a critical assessment of the ancient doctrine of principles, Anaxagoras' homoeomeries, Democritus' theory of atoms, and other theories, led him to the discovery of material 'elements'. This theory of elements was not only different from the ancient doctrine of the four elements and the hermetic doctrine of the three principles, but also from Robert Boyle's corpuscular theory, and was a major step towards the modern notion of element.

Among his contributions to almost every aspect of natural history and its applications, from mineralogy to entomology, chemistry, mining, mechanics and so on, Jungius established a classification of plants into classes, genera and species according to a uniform principle (*ratio constans*). He made a distinction between specific differences (for example, leaves) and accidental differences which have no influence on the definition of the species (such as spines, smell, medical use, place, time of germination, number of petals and so on), thereby anticipating Linnaeus' system of classification.

Jurisprudence, historical

Historical jurisprudence is the title usually given to a group of theories, which flourished mainly in the nineteenth century, that explain law as the product of predetermined patterns of change based on social and economic change. It is thus opposed both to theories that see law as essentially an expression of the will of those holding political power (positivist theories) and to those that see it as an expression of principles that are part of man's nature and so applicable in any kind of society (natural law theories). The writers of the Scottish Enlightenment first connected the historical development of law with economic changes. In the nineteenth century, Savigny and Maine postulated grand evolutionary schemes, which purported to be applicable universally. They were, however, based on the development of ancient Roman law and could only with difficulty be applied to other systems. These schemes are now discredited, but in the twentieth century more modest studies have successfully related particular kinds of law to particular sets of social circumstances.

1 1 The historical school of law

Montesquieu in his influential *The Spirit of the Laws* (1748) first showed the connection between law and the circumstances of society. He accepted the natural lawyers' view that law must reflect the nature of things but insisted that the nature of things is not the same in every society. Rather law reflects the spirit of each society, which is an amalgam of various components, some physical, such as its climate and the qualities of its land, and some moral, such as religion and social customs. Montesquieu recognized that some societies were more developed than others and that therefore their laws had to be more sophisticated, but he imposed no scheme of historical progression on his material. Adam Smith in his *Lectures on Jurisprudence* (1762-3) argued that a society's law changes according to the progress of society through four stages based on the prevailing mode of subsistence, namely, hunting, pastoral, agricultural and commercial. The first three were reflected in developments in the law of property and the last in the law of contract. The writers of the Scottish Enlightenment accepted as axiomatic that as a society's mode of subsistence varies, so its laws must be different, and thus established the connection between legal and economic development.

In the nineteenth century these ideas formed the basis for theories of legal evolution, which held that law develops on predetermined lines from its own internal forces. The implication was that changes should be left to these natural social mechanisms and therefore that reform legislation and codification were contrary to the nature of law. Its theorists generalized from the history of ancient Roman law, which had a continuous development of over a thousand years, and appeared to be relatively unaffected by legislation. From its infancy as the law of a tribal society in the sixth century BC, it grew into the law of a world empire, reached its technical peak in the second and early third centuries AD and thereafter declined until its codification by the Emperor Justinian in the sixth century AD.

The main German protagonist of historical jurisprudence was F.K. von Savigny, whose view was published in (1814 as a polemic against the proposal to codify German law on the model of the Code Napoléon. Eighteenth-century proponents of codes had combined the positivist and the naturalist traditions by arguing that what would make the codes law was legislation but their substance would be dictated by what was congruous with man's nature. Savigny insisted that a people's law must fit its particular circumstances. He took over the idea that the history of Roman law was divided into three periods, dressed it in the metaphor of organic growth, which Edmund Burke had used to describe the unwritten constitution of Britain, and declared that law among the 'nobler' nations (by which Savigny meant essentially the Roman and the German) goes through three periods: growth, maturity and decline. In the first period it is manifested directly in the practices of the people. As society grows, some parts of law become more technical and are adapted by expert jurists, acting as delegates of the people; but whether it is based on custom or on juristic discussion, it is developed not by legislation but through silent forces within itself. In its infancy it is not technical enough for legislation and in its decline it is not worthy to be codified. The only suitable period for codification would be the period of maturity, but then, with the maximum participation of the people and juristic science at its zenith, legislation would be an unnecessary intrusion.

Savigny's followers in the German Historical School accepted the organic and inevitable connection between the

special character of a people and its language and its law. For them the spirit of a particular people (*Volksgeist*) was something more than Montesquieu's spirit. The latter comprised a number of quantifiable components. The *Volksgeist* had a mystical dimension, much in tune with the romanticism of the first half of the nineteenth century. The enthusiasm generated by the historical school produced a series of distinguished studies of legal history, both in the Roman law and in the Germanic law area.

2 2 Maine's ancient law

In France Charles Comte 1827) produced *Traité de legislation ou exposition des lois générales suivant lesquelles les peuples prospèrent, dépérissent ou restent stationnaires* (Treatise on Legislation or Exposition of the General Laws According to which Peoples Prosper, Decline or Remain Stationary). He put special emphasis on geographical and racial factors as accounting for the progress of some societies and lack of progress of others and their effect on such societies' law. Relying on the lectures of the English physiologist William Lawrence, he asserted the superiority of people of Caucasian race.

Comte's distinction between progressive and stationary societies was combined with Savigny's scheme of legal evolution by the principal English exponent of historical jurisprudence, Sir Henry Maine, in *Ancient Law* (1861). Maine was concerned to provide a theory which would explain the law of 'progressive' societies (principally ancient Rome and England) and act as a counterweight to the positivism of Bentham and Austin, which held that all true law was the product of legislation by a political sovereign. He was equally concerned to refute those who based law on a priori abstractions such as the law of nature, and sought to offer an explanation of law which was both empirical and universally true in the sense that natural science was true.

> If it be truth at all, it must be scientific truth. There can be no essential difference between the truths of the Astronomer, of the Physiologist and of the Historian. The great principle that underlies all our knowledge of the physical world, that Nature is ever consistent with herself, must also be true of human nature… if indeed history be true, it must teach that which every other science teaches - continuous sequence, inflexible order, and eternal law.

(Maine (1876: 265-6)

Maine's starting point was sound. By viewing all law as legislation, Bentham and his followers obscured the nature of legal change. As Maine insisted, the farther back in time we go, the farther we are removed from the Benthamite notion that law is made expressly by legislation. Rather it evolves imperceptibly. The science which Maine used as his model was geology: the rudimentary ideas of law found in the literature of early societies 'are to the jurist what the primary crusts of the earth are to the geologist' Maine 1861: 3).

Ancient Law, however, although purporting to be concerned with 'the early history of society', was not concerned with primitive societies, such as Native Americans. It was essentially limited to Indo-European societies and was structured round the development of the institutions of Roman law. Thus the account of the law of the earliest period of society starts with divinely inspired kings handing down isolated judgments, or 'themistes'. Later they lose their sacred power and are replaced by a small group of aristocrats who have a monopoly of knowledge of the traditional customs. They abuse their power and popular agitation demands the recording of the customs in 'Ancient Codes'. This is a generalization of what happened in Rome when the monarchy gave way to the Republic and the plebeians demanded the enactment of the Twelve Tables. The scheme is not readily discernible elsewhere and in particular it has little application to England.

On the other hand Maine introduced certain ideas which have entered the common currency of jurisprudential discourse. Examples are the recognition of fictions and equity as early 'agencies of legal change', which precede legislation; the predominance of procedural rules over substantive rules in early law; and especially his famous generalization: 'the movement of progressive societies has hitherto been a movement from Status to Contract' (Maine 1861: 170).

Maine's work fitted the mood of the age of biological evolution, produced by Darwin's *Origin of Species* (1859), but its ideas were challenged both by anthropologists, who showed that they did not apply to early non-Indo-European societies, and by legal historians, who objected to the inaccuracies of his generalizations. Politically Maine's ideas led to a legal conservatism that saw the movement from status to contract as leading to

ever greater self-determination for the individual, so that the imposition of any form of strict liability on someone without fault was condemned as contrary to the principles of legal evolution.

Loss of faith in the applicability of the methods of the natural sciences to social phenomena and in the idea of the progress of society reduced interest in Maine's theories. However, the notion that a society's law must be viewed as closely related to its social and economic circumstances and should be studied not in isolation but in comparison with the laws of other societies with similar or different circumstances became permanently rooted in legal thought and is now commonplace.

3 3 Maine's heirs

Two followers of Maine, James Bryce and Sir Paul Vinogradoff, attempted modifications of his ideas. Bryce (1901) developed the comparative method. For him the law of any society was always a compromise between tradition and convenience. The study of similarities and differences in different legal systems can lead to the identification of frequently recurring phenomena, which can be treated as universals and thus in turn elucidate the nature of law in general. Vinogradoff (1920-22) more ambitiously extrapolated from the history of European societies six stages of legal progress, from totemistic law through medieval law, marked by the tension between feudal and canon law, to individualistic jurisprudence and finally socialist jurisprudence.

The immediate heirs of historical jurisprudence can be found in various disciplines. In the area of social theory, its influence can be seen in the work of two significant writers. Ferdinand Tönnies (1887), starting from the movement from status to contract, developed the idea of two contrasting forms of social grouping, the *Gemeinschaft*, or community of those sharing to some degree a common way of life, and the *Gesellschaft*, a more limited relationship, based on the parties' will to achieve a particular purpose, usually by contract. In the same tradition Max Weber (1922) introduced a typology of legal authority, contrasting rational authority with traditional and charismatic types of authority. He popularized the notion of 'ideal' model types, in the sense of social constructs, not actually found in reality, but useful as hypotheses to enable the scholar to highlight similarities and differences in actual systems. These types provide a way of coping with the theorists' perennial dilemma of achieving their need to generalize while at the same time maintaining fidelity to accuracy (see Social theory and law §§1-3).

4 4 Historical jurisprudence today

Although much of what would once have been called historical jurisprudence is now carried on under such labels as legal anthropology or comparative legal history, there are signs of a revival of the traditional search for general patterns of legal change, but with more modest objectives than those of the nineteenth-century theorists. Progress is no longer seen in terms of continuous improvement, but recurring patterns of legal change, corresponding to social and economic changes, can be identified. By shifting the notion of causal connection from one of necessity to one of probability, one can postulate likely connections between forms of society and the kinds of law they have and this process can result in some, albeit provisional, general propositions. Hitherto theories were concerned almost exclusively with the institutions of private law, but it is possible fruitfully to use model types to relate the growth of a distinct public law to a society with particular characteristics (such as France) and so criticize its introduction in a society (such as England) which lacks those features (Allison (1996).

Roberto Unger 1976) has emphasized the need to identify the different conceptions of the law and of what may be expected from it that characterize different types of society. This has enabled him to distinguish various types of society on the basis of such interpretive explanations. Thus in 'savage' societies customary patterns of interaction among individuals and groups are based on a recognition that such patterns produce reciprocal expectations of conduct. In 'bureaucratic' societies, the state has become the controlling institution, in which the dominant hierarchy begins to take a critical attitude to social customs and seeks to control them through the publication of express rules, seen as emanations of the human will. The idea that such rules should apply equally to all members of the society only emerges, however, in societies of the 'legal order', as exemplified by the liberal societies of post-feudal Europe. Such societies are composed of different groups with different interests, no one of which is dominant, so that the law is seen as a cohesive force, binding all groups equally.

Another manifestation of what may be called historical jurisprudence concentrates on the identification of

recurring patterns in the technical development of law, irrespective of their social context. Such studies emphasize similarities between the legal techniques of the laws of different societies, in such matters as the relations between procedure and substantive law, for example, the effect of use of laymen, such as civil juries, on the nature of the law, or the relations between written law, in which the text is fixed but subject to recurring techniques of interpretation, and unwritten law, in which the rules are not finally formulated but elucidated on a case by case basis by authoritative judges or jurists.

Justice

*The idea of justice lies at the heart of moral and political philosophy. It is a necessary virtue of individuals in their interactions with others, and the principal virtue of social institutions, although not the only one. Just as an individual can display qualities such as integrity, charity and loyalty, so a society can also be more or less economically prosperous, artistically cultivated, and so on. Traditionally defined by the Latin tag '*suum cuique tribuere*' - to allocate to each his own - justice has always been closely connected to the ideas of desert and equality. Rewards and punishments are justly distributed if they go to those who deserve them. But in the absence of different desert claims, justice demands equal treatment.*

A common division of the topic distinguishes between corrective and distributive justice. Corrective justice covers that which is due to a person as punishment, distributive that which is due by way of benefits and burdens other than punishments. Within the sphere of corrective justice there is disagreement about the justification of punishment itself. But there has been - and is - widespread agreement on the criteria for just punishment: just punishments must be properly imposed and the quantum of punishment must reflect the seriousness of the offence.

There has been no such agreement about the content of just principles for the distribution of benefits and (non-punitive) burdens. Conventionalists claim that what is due to each person is given by the laws, customs and shared understandings of the community of which the person is a member. Teleologists believe that an account can be given of the good for human beings and that justice is the ordering principle through which a society (or humanity) pursues that good. Justice as mutual advantage proposes that the rules of justice can be derived from the rational agreement of each agent to cooperate with others to further their own self-interest. Theorists of what may be called justice as fairness believe that justice is a thin concept which provides a fair framework within which each person is enabled to pursue their own good.

1 Corrective justice

There is general agreement that a just punishment should meet the following criteria. First, it should be imposed only on a properly convicted wrongdoer. Second, the quantum of suffering should satisfy the principle of ordinal proportionality. This means, as Hirsch (1990) has put it, that 'persons convicted of crimes of comparable gravity should receive punishments of comparable severity' except where mitigating or aggravating circumstances alter the culpability of the offender. Third, the quantum of suffering should satisfy the principle of cardinal proportionality: there should be a vertical ranking of crimes and penalties by seriousness.

There is, however, disagreement over the justification for punishment, and this makes it controversial how 'seriousness', 'severity' and 'culpability' are assessed and how the scale of penalties should be fixed. Those who appeal to deterrence may regard a widespread and socially disruptive crime as serious (whatever its degree of moral wrongness), and favour a scale of penalties designed to deter criminality. Those who favour retribution, however, have traditionally regarded seriousness as a factor of moral culpability and the scale of penalties as being derived from some notion of desert (see Crime and punishment).

2 Conventionalism

Turning to social, or distributive, justice, the attraction of some form of conventionalist approach is clear. Since there are institutions, conventions and systems of law that determine what is due to whom, resolving issues of justice may be thought merely to require reading off the correct answer from such sources. The earliest extant statement of a conventionalist view of justice is offered by Socrates' interlocutors, Cephalus and Polemarchus, in Book I of Plato's *Republic*. Polemarchus states that justice is giving a man his due, or what is appropriate to him, and it is clear that for Polemarchus what is appropriate to each person is dictated by the conventions prevalent in contemporary Athenian society.

A more complicated statement of conventionalism has been offered by Michael Walzer (1983). He argues that every social good (for example, health care, wealth, income and political rights) has an appropriate criterion of distribution which is internally related to how that good is understood by society. For example, in the UK (as elsewhere), health care is understood essentially to concern itself with illness and the restoration of health. This shared understanding of health care seems to entail a distributive criterion: medical need. Anyone, therefore, who

claims that health care in the UK (and many other societies) ought to be distributed in accordance with, say, status has either failed to grasp the nature of the good of health care or falls outside the community which is united and defined by its shared understandings. The only universal principle of distributive justice is the demand that respect be given to different shared understandings: no community ought to impose its own understanding of a given good, and its criterion for the distribution of that good, on any other community with different views.

The dependence of this theory on shared understandings has led to its being criticized on both empirical and theoretical grounds. Empirically, it is doubtful that any society is so homogenous as to boast a single, coherent and uncontested understanding of each of its social goods. (Is the freezing of embryos so that women might have children later in life, after they have established themselves in a career, meeting a medical need?) Theoretically, the account is flawed because the proposed universal principle of justice is not found in any society. A belief may be ‘ours’ in that it defines justice *according* to us; but it does not follow that we believe it is ‘ours’ in the sense of *applying* only to us. If justice is internally related to social understandings, there can be no perspective from which anyone might, from outside a given set of understandings, condemn the understandings or practices of a society as unjust. Yet there clearly is such a perspective. For example, in a hierarchical society it may be that the local conception of justice would require gross inequalities based on ascription at birth; this could be regarded as unjust.

The *prima facie* attraction of conventionalism is immediately undone when one asks why any given set of conventions, laws, or shared understandings should determine the distribution of benefits and burdens. Once this question is asked there is no reason why the answer has to flow from within the narrow resources of the community. It is at this point, when one asks why things are as they are, that the philosophical problem of justice really begins.

3 Teleology

In the history of thought about justice, the most common justification of any given set of laws, conventions or practices has been to appeal to an external, usually divine, authority. In the natural law tradition, to make an act just it is not enough that it complies with the society’s positive law. The positive law must itself be in accordance with a natural law which is knowable through the faculty of human reason (see Natural law). This tradition, owing its origins to the Greek Stoics, found its most lucid interpreter in Cicero (§§2, 4) and was given its definitive Christian form by Aquinas (§13). ‘True law’, writes Cicero, ‘is right reason in agreement with nature; it is of universal application, unchanging and everlasting’(*c*.54-51 bc: III, XXII, 211). The link to human nature via human reason is important, for it then follows that human beings reach their true end, or realize their true natures, only by living in accordance with natural law. What justice is and why it is a good are, thus, answered at the same time.

A major problem for this account is its reliance on an external source. Cicero is typical in claiming in the same passage that it is God who ‘is the author of this law, its promulgator, and its enforcing judge’. Natural law theory faces the difficulty of having to give an account of the existence and verifiability of the ‘true and unchanging’ moral order. Commonly, the natural law was conveniently said to underwrite the existing positive law: this may reflect the role of the powerful both in formulating positive law and defining natural law.

Suppose we are attracted to the notion that human institutions are to be justified by their contribution to human good, but do not believe that human reason is capable of discerning a divine plan. Then we may naturally arrive at the secular alternative embodied in utilitarianism: the idea that the ground of justification is human wellbeing, happiness or ‘utility’. When the utility of different people conflicts, the criterion for bringing their interests into relationship with one another is that aggregate utility is to be maximized (see Utilitarianism).

Utilitarianism can be characterized as a theory of justice if we simply define justice as the principal virtue of institutions. Utilitarians claim that, in the last analysis, there is only one virtue that matters: maximizing utility. However, utilitarianism is liable to violate elementary demands of justice as they are commonly understood: two people with identical deserts will be treated very differently if the utilitarian calculus happens to produce the finding that utility would be maximized by so doing. The common belief is that what is due to a person ought to be related to something about that person, not derived from a calculation about what would most effectively further some overall desirable state of affairs.

An important line of thought within utilitarianism has attempted to head off such criticisms by arguing that in practice the dictates of utilitarianism would underwrite the practices and institutions that are usually thought of as being required by justice. Thus, David Hume (§4), in *A Treatise of Human Nature* (1739-40), described justice as an 'artificial virtue' in that individual acts of justice contributed to utility not directly (as an act of benevolence would) but indirectly *qua* adherence to an institution that was on the whole beneficial. Hume's examples were respect for property, chastity (in women), allegiance to the government and promise-keeping. For Hume, then, justice was a convention - but it made sense to ask what good was served by following it. On somewhat parallel lines, J.S. Mill (§11) argued in 'Utilitarianism' (1861) that 'justice' is the name we give to those precepts whose strict observance is important for the furtherance of the utilitarian end. Thus, utilitarians argue that the arbitrary departures from social rules summoned up by anti-utilitarians as an implication of the doctrine are, in the long term, not really for the general good. Opponents of utilitarianism however have claimed that situations might still arise in which injustice (as normally understood) would be for the general good. Further, they complain that the foundations of the theory remain unsatisfactory because it does not (in John Rawls' phrase) 'take seriously the separateness of persons'.

4 Justice as mutual advantage

Utilitarianism is based on the assumption that the good of different individuals can be in some sense lumped together, and the pursuit of aggregate utility proposed as the objective of everyone. But, in the absence of an external lawgiver, how can an (not naturally benevolent) individual be encouraged to adopt the maximization of total utility as a binding demand? If we doubt that any satisfactory answer can be given, we may be tempted by a theory of justice that takes as its starting point the assumption that each person has a conception of their own good, and that justice must be shown to contribute to the attainment of that good. Justice is thus the terms of a *modus vivendi*: it gives everyone the best chance of achieving their good that they can reasonably expect, given that others are simultaneously trying to achieve their (different) good. Versions of 'justice as mutual advantage' can be found in Thrasymachus' 'might is right' argument in Book I of Plato's *Republic* and in the fraudulent social contract identified by Rousseau (1755: Part II) as having been perpetrated by the rich on the poor. But the *locus classicus* of this theory is undoubtedly *Leviathan* by Thomas Hobbes (§7).

If the terms of agreement are to be to the advantage of each (compared with unrestrained conflict), they must reflect the relative bargaining strengths of the cooperators. The strong and talented have little to gain (or to fear) from the weak or infirm, and the latter may even 'fall beyond the pale' of morality if the strong have no reason for taking their interests into account (Gauthier 1986: 268). Intuitively, it may seem perverse to call this a theory of justice. It is true that justice as mutual advantage has much of the structure of a theory of justice in that it results in rules that constrain the pursuit of self-interest. But the content of those rules will correspond to those of ordinary ideas of justice only if a rough equality of power holds between all the parties.

Even if this objection is not regarded as decisive, the theory suffers from internal problems. These concern the determinacy of the rules and their stability. The determinacy problem arises because of the necessity for all to start from a common view of the relative bargaining strengths of the participants. This is an immensely demanding condition, given the information about resources required and the different predictions that are liable to be made about the outcome of conflict. Even after rules have been agreed, some parties will have reason to press for changes if their bargaining power increases. Justice as mutual advantage results in rules which are no more than truces and, like truces, they are unlikely to be stable if there are changes in the balance of power between the sides (Barry 1995: 41).

Stability will also be challenged by the problem of non-compliance. Justice as mutual advantage appeals to the self-interest of each and does so by establishing rules that, if generally complied with, will further the interests of all individuals. However, this gives the agent no reason to comply with a given rule when there is greater advantage to be had by breaking it. This applies especially when the agent can free ride on the compliance of others. All that can be attempted is to increase the costs of non-compliance by increasing the sanctions if the agent is detected. To run a society using only self-interest and sanctions, however, would mean using a degree of coercion and of 'policing' hitherto unthought of in even the most totalitarian society.

5 Justice as fairness

Theories of justice as fairness start, like those of justice as mutual advantage, from the premise that the role of justice is to provide a framework within which people with competing ideas of the good can live together without conflict. However, justice as fairness seeks a framework that can be said to be fair to all the parties. It aspires to allocate to each person a fair set of opportunities to pursue their idea of the good life. The problem is that if what is due to each person is not determined by convention, by some overarching theory of the good, or by mutual advantage, how is it to be determined? On this question there is widespread disagreement. What is agreed is that there is an initial equal claim to consideration (see Kymlicka 1990). The root of disagreement lies in determining the scope, grounds and nature of this equality.

The range of accounts of the content of justice which is compatible with justice as fairness is very great: Robert Nozick's entitlement theory and John Rawls' theory of justice, for example, come to very different conclusions about what justice demands, even though both start with the basic idea that justice is to regulate the interactions of free and equal persons. Nozick believes that 'individuals have rights, and there are things no person or group may do to them (without violating their rights)' (1974: ix). From this starting point he generates what he calls an entitlement theory of justice (see Nozick, R. §2). The just pattern of distribution is that which would result from voluntary transfers, given that holdings were justly acquired in the first place (by just transfer or by an appropriation that makes no one else worse off). Nozick, then, regards the claim to an equal set of absolute rights as defining the limits of justice: any actions which interfere with those rights (such as redistribution) are unjust no matter what the pattern or outcome of the entitlement theory. Nozick does not, however, offer any account of the existence of such robust rights, and his arguments from intuition to show that any interference with individual rights is unjust are unconvincing. It is plausible that injustice may result from a large number of individual transactions each of which taken separately seems just.

John Rawls (1971) has argued that justice requires the provision of equal basic liberties and fair opportunities for all, and that social and economic inequality can only be justified where it is to the benefit of the least advantaged. These principles are derived by arguing that they would be chosen by free persons in an 'original position', the specifications of which prevent people from making unfair use of their natural and social advantages (see Contractarianism §7; Rawls, J. §1). Rawls then, in contrast to Nozick, believes that justice requires us to do much more for each agent than merely provide them with absolute property rights. Rather, the pattern of distribution is set at that which will maximally benefit the worst off. The question is one of determining the content of justice: when is it appropriate to move away from the concept of equality? 'when have we done enough' for a person to be able to say that variations in outcome are 'deserved'? (Scanlon 1988: 187) (see Equality; Desert and merit)

Recent work in Anglo-American political theory has been dominated by the development of theories between these positions. Ronald Dworkin (1981), for example, has argued that Rawls goes too far in treating all characteristics that make people more or less productive as 'morally arbitrary', and thus fails to allow for the justice of rewarding enterprise and ambition. Dworkin, in his own work, seeks to accommodate differences in ambition while retaining the feature of endowment insensitivity (see Dworkin, R.).

A different line of argument is that Rawls' original position is not a bargaining environment because the veil of ignorance entails that the participants are identical. Moreover, Rawls secures the two principles only by building in a number of ad hoc requirements (for example, that the participants are risk averse). The alternative proposed is to posit participants who are aware of their identities and *morally* motivated to seek agreement. Such a position has been proposed by the philosopher Thomas Scanlon (1982) and developed into a theory of justice by Brian Barry (1995) (see Contractarianism §9).

All theories of justice as fairness face the problem of grounding the commitment to the fundamental equality of persons and giving an account of each agent's motivation to behave justly. Rawls offers two justifications for his principles. The first is that the principles match our 'considered moral judgements' about justice: we come to a 'reflective equilibrium' in which the principles reflect and organize our moral intuitions. The second justification is offered as a Kantian interpretation. On this account the original position provides a 'procedural interpretation' of Kant's realm of the 'kingdom of ends' (see Kant, I. §9). The original position and the choice of the principles are viewed as an attempt to replicate Kant's reduction of morality to autonomy and autonomy to rationality. Thus, by living in accordance with justice we realize our true natures as autonomous beings. This provides the motivation required.

In later papers and in his second book, *Political Liberalism* (1993), Rawls has moved away from the Kantian interpretation on the grounds that it requires a controversial metaphysics and that it commits him to a particular view of the good life as autonomy. Instead Rawls now emphasizes that his theory relies on nothing more than ideas 'latent in the public political culture' of modern Western democratic states. This move aligns him with the conventionalist position discussed in §2, and is open to the criticisms raised there. Without the Kantian interpretation it is also difficult for Rawls to give an account of moral motivation. What is left is a theory that claims to give a content to the idea of justice but which cannot, when the demands of justice conflict with the self-interest of the agent, provide the agent with a reason to be moral (Nagel 1991).

Scanlon's and Barry's accounts assume morally motivated individuals who are concerned to find terms of agreement which reflect the equality of persons. Barry has argued that the demands of fairness can be generated from the lack of an authoritative account of the good; but this argument still relies on a prior commitment to freedom and equality. There is, however, no reason why such theories should not claim that such a commitment has universalist implications: an appeal to what we believe does not mean that what we believe applies only to us. Similarly, theorists of justice as fairness need not make the illegitimate claim (much more often attributed to them than made by them) that justice as fairness is neutral between all ways of life (no matter how illiberal) (see Neutrality, political).

Justice as fairness can claim to give a content to the idea of justice by telling us what is justly due to whom, and can do so in a way that matches our fundamental intuitions about the nature not only of justice but of morality generally - namely, that each agent is a locus of equal value. That they cannot provide the agent with a decisive reason to behave morally when to do so conflicts with the agent's self-interest or conception of the good may not reflect a defect of justice as fairness. Rather, it may be an inevitable aspect of moral theorizing without recourse to a divine order or a single, comprehensive, idea of the good (see Moral motivation).

6 Critics of justice

The discussion so far has proceeded on the assumption that justice is the principal virtue of institutions. The theories of justice examined here would explain this primacy in different ways; by appealing to the most important shared understandings, the most stringent demands of Nature or God, the conduciveness of justice to utility or civil peace, or the role of justice in providing a fair framework for the pursuit of different conceptions of the good. But all agree that, where justice conflicts with other values, those other values must give way.

This consensus has been challenged on the grounds that under ideal conditions justice would be unnecessary, and appeals to it would actually destroy valuable social relationships. Thus, a marriage in which the spouses were constantly arguing in terms of rights and duties would be less good than one in which mutual love created spontaneous harmony. By an extension of this sentimental line of thought, an ideal community would be one in which justice had been transcended by a spirit of what used to be called (until feminist scholars objected) fraternity. This is one strand in the thought of Marx, and it recurs in the work of some contemporary feminist and communitarian writers (see Community and communitarianism; Feminist political philosophy §4).

The theorists of justice discussed above would not necessarily dispute such claims. Both Hume and Rawls argued that there are 'circumstances of justice' that make justice necessary. These are precisely the conditions - conflicting demands for material goods and unreconcilable aspirations - that the critics of justice believe would be transcended by a sufficiently strong community spirit. The disagreement is not analytical but turns on the view taken of the possibility and the desirability of creating a community in which justice ceased to be the first virtue. The partisans of justice can point out that the theoretical assault on 'bourgeois morality' has provided the supposed justification for the most appalling violations of rights (for example, in China, Cambodia and the former USSR), and ask if there is any reason to suppose that other social experiments driven by the same animus would be any more benign.

Justice, equity and law

Laws are intended to achieve justice, but the application of an otherwise just law may yield an injustice in the circumstances of a particular case. This is because laws are framed in terms of general rules which cannot adequately provide in advance for all possible variations in relevant circumstances. Equity modifies the rigid application of the law in such cases in order to secure justice in the light of all the relevant circumstances. So, in Aquinas' example, the law may justly require the closure of the city gates after a certain hour, but officials may equitably decree the opening of the gates during the legal hours of closure in order to save fighters defending the city who are being pursued by an enemy. In this sense, the equitable decision is not distinct from justice, but rather secures justice in the particular case by remedying the deficiencies of positive law retrospectively at the point of application. The question of the proper relationship between justice, equity and law has been explored both by a rich philosophical tradition that finds its classic statement in the writings of Aristotle, and by the world's major legal traditions.

At least two major problems arise for this complex of ideas. First, that of the 'decadence' of equity. As equity is incorporated into formal processes of legal adjudication, for instance in the form of 'maxims' of equity or equitable 'doctrines', it comes to acquire the generality of positive law. This creates the problem that the so-called equitable maxims or doctrines may themselves then be applied in a strict way that leads to injustice in the particular case, which is precisely the problem equity is meant to remedy. Second, in securing justice by the deployment of discretion in the particular case equity also threatens an injustice. For it seems to involve a departure from the principle of legality, that is, the duty to apply pre-existing laws declared beforehand to those subject to them. In being adversely affected by the retrospectively operative discretion of the adjudicator, the party who would have benefited from the strict application of the law may regard the resort to equity as itself unjust.

1 Positive law and justice

A fundamental objective of positive law is widely thought to be that of achieving justice. Even contemporary legal positivists hold that it is an essential feature of law that it claims to conform with precepts of justice (see Legal positivism §4). In its broadest sense, justice refers to those moral requirements that apply in any interpersonal context. It is that part of morality that governs the relations and interactions between morally significant beings. It is in this vein that John Rawls refers to an abstract *concept* of justice - understood as a 'set of principles for assigning rights and duties and for determining… a proper distribution of the benefits and burdens of social cooperation' (Rawls (1971: 5) - that is shared by most people who engage in discourse about justice, but regarding which there may be vastly divergent and competing specific interpretations or *conceptions*.

However justice is understood, it is a further widely held belief that positive laws may fail to achieve justice. Those who deny the moral fallibility of law are the proponents of a rarely held version of normative ethical relativism, according to which the laws of one's community are always just or according to which justice is to be identified with the standards enshrined in those laws. But this sort of relativism conflicts with the pervasive fact that people do submit laws to critical scrutiny in terms of independent standards of justice and often intelligibly purport to find those laws to be unjust for breaching those standards.

Given that positive laws are morally fallible, injustice can arise in various ways (Finnis 1980: 352-4). The lawmaker may have been motivated by improper considerations; the law may have been made outside the scope of the lawmaker's authority; the law may have been enacted in contravention of the formal requirements of the rule of law, for example, publicity, generality, prospectivity, and so on; and, finally, the law may be substantively unjust, because it posits a morally defective assignment of rights and duties or benefits and burdens.

2 Equity between law and justice

The study of the relationship between justice, equity and law belongs in a normative theory of legal adjudication (see Legal reasoning and interpretation). This is concerned with articulating the nature of ethically sound legal adjudication. One of its central aims is to determine whether and how a judge or other legal decision-maker may rely on the deliverances of their sense of justice in order to adjust, or depart from, the strict application of a law to avoid doing injustice in the circumstances of a particular case. It is in responding to this question that the nexus

between justice, equity and law has been invoked, both by an illustrious philosophical tradition and by the world's major legal systems.

Equity is a form of judgment that remedies the injustice of positive law at the point of application by attending to the particular features of the persons and circumstances involved. Thus, equity is not concerned with defects in intention, author and form or with the substantive injustice of the general rule itself. Even if a positive law avoids these kinds of injustice it may still yield a result that is substantively unjust when it is applied to a particular set of facts. The source of the injustice is the inherent generality of legal rules. We can trace the philosophical elaboration of the idea of equity back to ancient Greece. The canonical text is Aristotle's *Nicomachean Ethics*, especially Book V, as supplemented by his discussion in the *The Art of Rhetoric*, although Aristotle's account is prefigured in earlier writings both literary and philosophical, for example by Plato (see Aristotle; Plato).

For Aristotle justice, both as an individual virtue and as an ordering of social life, is only possible within the context of the institutional arrangements, especially the laws, of a political community. He attributes three general characteristics to laws (see Yack 1993: 180-4). First, laws are expressed in the form of general rules intended to apply to an indefinite multiplicity of future situations. This is what distinguishes them from decrees (*psephismata*) about specific individuals and circumstances. Second, they apply to all members of the political community, including its leaders. Third, laws originate in the practical wisdom (*phronēsis*) of individuals and communities. The latter feature does not mean that laws are inherently good or just, but rather that they represent a fallible attempt on the part of humans' practical reason to cope with the problems of establishing a morally sound ordering of social life.

Aristotle introduces his analysis of equity (*epieikeia*) by means of an apparent paradox: equity seems neither the same as justice nor different from it in kind. On the one hand, we regard equity as a praiseworthy quality in both individuals and judgments. But it seems odd to value the equitable if it does not coincide with the just. Hence the dilemma: either we must cease regarding the just or the equitable as good; or, if they are both good, we must regard them as identical. Aristotle's solution is to define equity as a kind of justice, but a kind that is superior to and often opposed to another kind, strict legal justice. So, equity is not generically different from justice. But it is ideal justice - taking into account all the relevant circumstances of a given case - as opposed to justice strictly according to law.

The need for equity arises because the law is framed in general rules that apply prospectively to a vast number of future situations picked out by their general features. Only the general features thus identified (for example, regarding the type of person to which the rule applies, the type of activity it regulates, and so on) are relevant to the application of the rule. These comprise the only material facts to be taken into account in applying the rule, with all other facts being ignored. But, when applied to a particular situation in accordance with its terms, such a general rule may work an injustice. This will be either because the general rule is silent with respect to a particular situation, so that a just resolution is not secured, or because its application leads to an unjust result. This deficiency is not the fault of the lawmaker, but resides in the inherent variability of the circumstances of human life, which are such that the demands of practical wisdom (*phronēsis*) cannot be adequately captured in any set of general rules capable of a mechanical and unerring application.

In such cases equity justifies a departure from the strict letter of the legal rule, and a resort to its animating purpose or intention, in order to secure justice. Equity thus mediates between positive law and justice by importing an element of flexibility and context-sensitivity into legal adjudication. Hence the essential nature of equity as 'a rectification of law in so far as law is defective on account of its generality' (*Nicomachean Ethics* 1137b26-7; or 'right going beyond the written law', *The Art of Rhetoric* 1374a27-8).

The benefits of equity go beyond the attainment of justice in the particular case. On the one hand, equitable discretion admits into the adjudicative process ameliorative values such as mercy that mitigate the harshness of legal rules (see Forgiveness and mercy §3). The emergence of equity is therefore historically bound up with a heightened sensitivity to the plight of individuals, as opposed to an unbending concern with the maintenance of an impersonal moral order (Nussbaum 1993: 87-92). On the other hand, where the unforeseen situations to which equity responds reflect important changes in society generally, equity can be seen as a mechanism for the progressive and piecemeal adaptation of law to evolution in social conditions and moral belief. This reforming process is augmented by the tendency of the grounds on which equitable judgments are made to be

'systematized' into rules of positive law (see Maine 1930: 15).

It is clear that Aristotle regards equity as constituting a general virtue of character that also operates outside the context of formal legal adjudication. The equitable person 'is not unduly insistent upon his rights, but accepts less than his share, although he has the law on his side' (*Nicomachean Ethics* 1137b34-1138a3; *The Art of Rhetoric* 128). He also differentiates crimes from errors and misfortunes, since the latter are not a product of human wickedness; forgives human failings; judges actions in terms of the purposes of their agents and the entire context in which they occur; and recollects the good rather than the bad treatment they have received and endures being wronged. But the connection between equity and mercy is not yet fully established in Aristotle's analysis, for the latter can involve a leniency in assigning and exacting punishment that tempers the demands of particularized justice itself. Aristotle's concern is that such leniency may express an unacceptable self-depreciation in the face of injustices committed by others. A fuller elaboration of the connection between equity and mercy is, instead, given by the Roman Stoics (see Stoicism), especially Seneca, and the medieval canonists.

3 Contemporary influence

Although Aristotle is the key figure in the equity tradition in philosophy, this general complex of ideas has a line of inheritance that includes the Greek and Roman Stoics, the Roman orators, St Thomas Aquinas and the medieval canonists and casuists. In contemporary jurisprudence, however, this tradition has been somewhat sidelined by a preoccupation with the logically prior question of whether in fact judges ever do, or should, possess discretion. There are, however, three contemporary movements which embody essential themes of the equity tradition. Despite their many differences, they are united by a rejection of the merely mechanical application of general legal rules as an adequate normative account of legal adjudication and by an emphasis on the need for sound legal reasoning to be attentive to the normative significance of the constituent features of the particular case.

First, there is the neo-Aristotelian approach to legal reasoning (for example, Kronman 1993: Part 1). This portrays legal reasoning as a matter of Aristotelian practical wisdom, a mode of judgment that implicates the character of the legal reasoner in response to the salient particularities of the situation they are adjudicating upon, and not as the expert manipulation of a body of legal norms in a merely 'technical' or 'scientific' fashion. More generally, the emergence of neo-Aristotelian theories of practical reasoning illustrates the same line of thought. These urge the inadequacy of a purely rule-bound conception of practical reasoning - commonly associated with the Kantian and utilitarian traditions (see Kantian ethics; Utilitarianism) - and defend instead a model of practical reasoning as involving a quasi-perceptual appreciation of the normative demands generated by the particular context of agency and deliberation. Proponents of neo-Aristotelian theories of practical reasoning include John McDowell 1979), Martha Nussbaum, David Wiggins (1975-6) and Alasdair MacIntyre. The latter explicitly contends that Aristotle's account of the need for equity in purely legal contexts holds of practical life and reasoning in general (MacIntyre 1988: 120).

Second, the equity tradition resonates with key themes in feminist legal theory. For much feminist theory posits a stark opposition between a 'masculine' approach to legal reasoning, one that prizes the rigorous application of general rules that inevitably abstract from the rich complexity of concrete situations, and a 'feminine' approach that is highly particularistic, arriving at a judgment of substantive justice that reflects the totality of the circumstances (see Gilligan 1982). Feminist theory tends to employ this opposition in an antinomian way, privileging the substantive justice attainable through the exercise of unconstrained discretion over the idea of rule-following. Here it departs from the equity tradition, which views equitable discretion as a supplement to rule-governed reasoning in law (see Feminist jurisprudence).

Third, the 'law and literature' movement advances the reading and appreciation of literary texts as a model for legal adjudication. In the hands of one of its major exponents - Martha Nussbaum - the connection with the equity tradition is made central. Nussbaum stresses the importance Aristotle accords to *sungnome*, or 'judging with', in his analysis of equity. This is the sympathetic understanding of 'human things' which is tied up with the disposition to appraise actions in relation to the motives and intentions that animate them as well as the broader personal and social context in which they occur. Nussbaum associates this account of equitable judgment with Aristotle's theory of tragedy, which involves the spectator attending to the particular features of a tragic hero's narrative and, by doing so, sympathetically identifying with their plight. In Nussbaum's own analysis, however, the paradigmatic model of equitable judgment is not that of the spectatorship of tragic plays, but rather the

sensitive reading of a novel, since the latter genre exceeds tragic drama in its formal commitment to 'following complex life histories, looking at the minute details of motive and intention and their social formation' (Nussbaum 1993: 105).

4 The 'systematization' and 'decadence' of equity

The equity tradition in philosophy has had an impact on the two major Western legal traditions: Roman law and English common law. Equity is recognized in Roman law in the distinction between *ius* (law) and *aequitas* (equity), in the Roman orators' maxim *summum ius summa iniuria* (extreme right is extreme injury), and, most importantly, in the role of the *praetor*, an official empowered to grant a remedy where no legal remedy previously existed by exercising an equitable discretion. But perhaps the most conspicuous attempt formally to incorporate the notion of the equitable mediation between legal rules and justice is provided by the English common law.

From the fifteenth century until the late nineteenth century the English legal system was unique in maintaining an institutional distinction between courts that administered the common law, and those that administered equity (since then the bifurcated system has been abolished, and all courts are empowered to apply both law and equity). The court dispensing equity - the Court of Chancery - dealt with petitions from those claiming that the common law system was not capable of achieving a just result in their particular case. Equity was viewed as supplementing the common law and remedying some of its imperfections by developing discretionary remedies to deal with situations where the rigorous application of common law rules would lead to an injustice. By the sixteenth century, the dominant justification for this sort of modification of the application of general legal rules in specific cases was sought in Aristotle's writings on equity.

As in the Roman case, a chief concern of English equity was to give effect to the substance of transactions, despite failures of legal form. This coheres with the Aristotelian notion that equity looks to the substance of the law and to the intentions of the parties. So, for example, the Court of Chancery could relieve a party from meeting a legal requirement that a contract be put in writing if it would be against conscience for the other party to rely on the lack of writing, for example, when the first party has already carried out his part of the bargain. Equity also recognizes that the common law remedy for breach of contract - monetary damages - does not yield a just result in certain cases, and allows for an order that the contract be performed specifically. Similarly, equity intervened in other situations where strict reliance on legal rules was productive of injustice: for example, where there is fraud or mistake in formal transactions, to protect people incapable of looking after their own interests, or to protect relationships of trust and confidence. In addition to these doctrines, a number of principles were formulated - 'maxims of equity' - to underwrite and justify the use of equitable discretion, for example, 'he who comes to equity must have clean hands', 'equity regards the substance and not the form', 'equity is equality'.

With the systematization of equity into doctrines - such as that of specific performance, trusts and so on - and maxims that came to have the force of general rules of law, the Court of Chancery in turn came to be almost as rule-bound in its activities as the common law courts. Equity thereby ceased to be - as on the Aristotelian model - a discretionary modification of the application of legal rules in response to the particular circumstances of the case, and became instead a separate body of law itself expressible in general rules.

But with this systematization there arises the danger of what Roscoe Pound called 'the decadence of equity' (Pound 1905: 25). As equity becomes a system of legal rules, those rules are susceptible to being applied in a strict way that leads to injustice in the particular case, which is precisely the problem equity was meant to remedy. Pound's prescription was not to resist systematization, but rather to adopt an attitude of vigilance (see Pound, R.).

5 The conflict with legality

The idea of equity as a discretionary rectification of positive law at the point of application in the interests of substantive justice has, however, been subjected to a number of criticisms (see Lucas 1966: 214-22). Most of these come down to the objection that equity conflicts with the principle of legality. This is a normative principle requiring adjudicators to resolve disputes by applying legal rules that have been declared beforehand, and not to alter the legal situation retrospectively by discretionary departures from established law. The principle of legality, therefore, provides a basis for claiming that the deployment of equitable discretion, although intended to secure justice in the particular case, in fact produces injustice to the party adversely affected by it. But whence derives the

normative force of the principle of legality itself?

Most importantly, it derives from the fact that it expresses a requirement of the rule of law as it bears on adjudicators (see Rule of law (rechtsstaat)). The rule of law requires that people - including the legal officials of a state - be ruled by the law and obey it. But this whole ideal will be undercut if adjudicative bodies fail to apply pre-existing law in accordance with its clear and settled meaning. The sort of retrospective modification of pre-existing legal rules that is authorized by equity threatens this principle. The rule of law itself is upheld because it secures a number of central values. First, it achieves certainty and predictability in legal administration, so that people will know to what laws (and, in particular, what legal penalties) they will be subject. This enables them to plan their affairs, which is itself a key manifestation of a form of 'negative' liberty. Second, it protects human dignity. General legal rules create rational expectations among those subject to them. For an adjudicator to frustrate those expectations retrospectively seems akin - as Bentham argued - to the arbitrary way in which a man makes law for his dog: not declaring beforehand what conduct is required but rather waiting until the animal has done something he thinks wrong, and beating it. That equity is in tension with the rule of law, that its essentially discretionary and retrospective character imports an unacceptable element of uncertainty and arbitrariness into the legal system, is a common complaint, one expressed famously in the English legal context by the jibe that equity varied with the length of the Lord Chancellor's foot.

It is the attraction of the principle of legality which explains in large part the tendency to crystallize the grounds of equitable intervention into general legal rules, which in turn leads to the problem of the 'decadence' of equity mentioned above. More generally, it seems that we are confronted here with a conflict between 'formal' legal justice (which may be expressed in the injunction to 'treat like cases alike', where the criterion of likeness is determined by features picked out in advance by general legal rules) and 'substantive' justice in the particular case, which is the concern of equity. The sense of a clash between basic values is heightened by the realization that the 'generality' of legal rules - which is the structural source of the injustice that equity is meant to correct - is itself a requirement of the rule of law as it bears on the activities of legislatures (disallowing Acts of Attainder, for example).

6 Responses to the conflict

The classical equity tradition does not provide us with a ready response to such criticisms, mainly because the rule of law (in its connection with certainty and autonomy, at least) is a distinctively modern value that did not have a prominent role in the classical tradition represented by Aristotle and Aquinas. However, a response to such criticism might be to argue that the notion of equity can be understood as grounded in existing law, and therefore not discretionary in any way that seriously impugns the rule of law. There are at least two versions of this reply.

First, it might be claimed that in dispensing equity, the adjudicator is not departing from existing law nor making new law, but rather complying with the intention (as opposed to the letter) of existing law, which is its true meaning. This in fact is Aristotle's construal: the equitable adjudicator decides the case as the legislator would have decided it had he been aware of those particular circumstances. This response suffers from two main defects. On the one hand, it may be unworkable, given that it may not be possible to find any, or the right kind of, underlying legislative intention in a given case. In particular, all the serious difficulties involved in constructing a counterfactual intention arise here. On the other hand, to seek to avoid this problem through a presumption that legislators always intend to secure justice is to fall into vacuity, for what will then be at work will be a discretionary judgment dressed up as the realization of the legislator's intention.

The second version holds that the equity is grounded in ethical principles which are part of the law. One might here deploy Dworkin's theory of adjudication, according to which judges must strive to identify the set of ethical principles that provide the best interpretation of the back letter legal rules (Dworkin 1977). These principles are for Dworkin part of the law, and yield a single right answer in each case, thus eliminating the need for extra-legal discretion (see Dworkin, R.). But again there are at least two problems. First, if they are part of the law, it is not at all clear that these principles really perform the classic function ascribed to equity. Indeed, the principles to which Dworkin refers are not usually thought of as equitable but rather as expressing the rationale behind a series of more particular rules, and hence legitimately controlling the application of those rules in particular cases. Second, in so far as principles are legal standards with a determinate content, they fall victim to the possibility of the 'decadence' of equity.

A more promising line of response is to reject the demand to make an all-or-nothing choice between legality and equity (formal justice and substantive justice, rule and discretion) as posing a false dilemma. What is needed in any ethically sound legal system is an appropriate mix of both of these values, not a decision single-mindedly to pursue one at the complete expense of the other. Indeed, the equity tradition conceives of equity as a crucial supplement and corrective to legality in certain circumstances, not something that licenses the substitution of an unfettered and arbitrary discretion for the application of legal rules. Further, combining both legality and equity, rule and discretion, in a legal system seems practically unavoidable. This is because the idea of pure legality, of a legal code so determinate in its meaning that it calls for no discretionary judgment on the part of the adjudicator, seems illusory. The leeway for discretion will arise from at least two sources, in addition to the source (generality) already mentioned as giving rise to equity. These are: (1) indeterminacy in the interpretation of rules; and (2) indeterminacy in the proper characterization of the fact situation to which it will apply (see Lucas 1966: 24-5).

What is more difficult to ascertain is how the institutional balance between legality and equity is to be rightly struck. There is no reason to believe that there is a single best solution to this problem. But the equity tradition as discussed here does offer guidance on the reasonable solution in concrete circumstances (see Tasioulas 1996: 462-6); the rule of law tradition and the equity tradition need to be read together and held in balance.

Justice, international

Although it has been denied (by, for example, F.A. Hayek 1976) that the concept of distributive justice has application within states, it is not controversial that there can be unjust laws and unjust behaviour by individuals and organizations. It has, however, been argued that it makes no sense to speak of justice and injustice beyond the boundaries of states, either because the lack of an international sovereign entails that the conditions for justice do not exist, or because the state constitutes the maximal moral community. Both arguments are flawed. Without them, we are naturally led to ask what are the implications of the widely-held idea of fundamental human equality, the belief that in some sense human beings are of equal value. This cannot be coherently deployed in a way that restricts its application to within-state relations. In either a utilitarian or Kantian form it generates extensive international obligations. An objection that is often made to this conclusion is that the obligations derived are so stringent that compliance cannot reasonably be asked under current political conditions. But this shows (if true) that current political conditions are incompatible with international justice.

1 The scope of international justice

In its most literal sense, ‘international justice’ refers to justice between nations - ‘nations’ in this context being equivalent to ‘states’, as in ‘international law’, ‘national sovereignty’, and so on. Following common usage in political philosophy, it will here be understood in a more extended sense. In this sense, ‘international justice’ refers to justice in any context other than that of the purely internal affairs of a state.

It is possible that an inquiry into international justice will yield the conclusion that justice can be predicated properly only of relations between states. But formulating the scope of the inquiry in this way leaves open a variety of other possibilities. Thus, for example, it may be concluded that states have obligations of justice to individuals outside their borders (for example, to give asylum), that individuals have obligations of justice to states other than their own (for example, not to engage in terrorism), and that international organizations, transnational corporations and collective actors other than states have obligations of justice that should constrain their behaviour. The conclusion may also be that a world organized into states is inherently incapable of satisfying the demands of justice, and that only a single worldwide state holds out any possibility of realizing global justice.

2 Scepticism about international justice

International justice has in common with some other topics (for example, theology) the peculiarity that there is some controversy about the existence of its object. One reason for scepticism is that international agreements, including those setting up international organizations, are (in Hobbes’ words) ‘covenants without the sword’. However, granting the premise that the international arena is a Hobbesian ‘state of nature’ (see Hobbes, T.§6), it still does not follow that considerations of justice are irrelevant to it. We should bear in mind the conclusion that Hobbes himself drew from the insecurity of a ‘state of nature’: that a sovereign was needed to supply the security that would render it safe to keep covenants and thus ensure their validity. This, as Hobbes recognized, leaves the sovereigns in a ‘state of nature’ with one another. But a more thoroughgoing Hobbesian might plausibly derive the conclusion that the lack of an international sovereign threatens precisely the calamities that states were supposed to protect against: violent death in war and lack of the conditions of ‘commodious living’. Even if the threat of war is receding, military expenditure diverts resources away from life-saving alternative uses. Moreover, the faltering international response to such issues as global warming and biodiversity may suggest that only international-level coercion is capable of maintaining the long-term conditions of life on the planet.

It is also worth recalling that, according to Hobbes, there can be obligations of justice even in a ‘state of nature’, since one of the ‘laws of nature’ is ‘that men perform their covenants made’ and justice consists in keeping covenants. Admittedly, the obligation is said to hold only when the other party has performed its part and there is no ‘new cause of fear’ arising subsequent to the making of the covenant. But this is enough to establish that, in general, states behave unjustly in reneging on an international agreement that the other signatories have adhered to.

A second line of argument derives from the romantic nationalist movement of the nineteenth century. This assumes that each state is the home of a community whose members share a certain view of the world which gives meaning to their lives (see Nation and nationalism). In its strongest (and most logically coherent) form, this doctrine

concludes that, since there is no moral community beyond the state, there is no basis for saying that anything a state does can be unjust. A weaker version (especially associated with Michael Walzer (1977)) maintains that the notion of distributive justice makes sense only within each community, since this consists in the distribution of each kind of good in accordance with the meaning that the community attributes to that good (see Justice §2). Clearly, there is no global community with shared understandings of the meanings of goods, so it follows that the notion of distributive justice has no application outside a state.

An obvious objection to both versions is that scarcely any states are moral communities of the postulated sort. Moreover, many people do in fact have views (albeit often somewhat inchoate) about what international justice requires. It is not necessary to have very sophisticated ideas about the shared meanings of goods to arrive at the view that there is something fundamentally wrong with a world in which millions of people are starving to death and dying of easily preventable diseases while others are reduced to buying jewelled necklaces for their pets to find a way of disposing of their incomes.

3 Cosmopolitan justice

The American Declaration of Independence, the French Declaration of the Rights of Man and the Citizen and the Universal Declaration of Human Rights all proclaim the equal value of all human beings. The two main strands of modern moral philosophy, Kantianism and utilitarianism, are likewise based on an axiom of equal value: for Kant everyone is a participant in the 'kingdom of ends' and entitled to equal respect, while for Bentham 'everybody counts for one' in the sense that all units of utility are given the same weight regardless of the identity of their owners.

In practice, however, many philosophers operate as if the axiom's validity extended only to fellow citizens, and much popular discourse follows the same lines. Yet a universal principle cannot simply have its application arbitrarily truncated at a state boundary. In revulsion against this, it is tempting to adopt an equally absolutist cosmopolitan line, according to which each of us should regard ourselves as citizens of the world, with no special obligations to the fellow citizens of our own state. But if (see §2) justice entails keeping covenants, may we not be said to be bound to our fellow citizens by innumerable implicit covenants? If you have contributed throughout your adult life to the national system of social insurance, for example, you have a claim on your fellow citizens for support in old age or in the event of becoming disabled and incapable of working. Your co-nationals owe this to you in virtue of a formal system of mutual aid: they do not have the same obligation to somebody (perhaps equally deserving or needy) who has not participated in the scheme.

There is nothing in this which is inconsistent with cosmopolitanism, understood as the extension to all human beings of the axiom of fundamental equality. Utilitarians normally recognize that the universal good is likely to be most effectively pursued indirectly. Similarly, a Kantian can agree that an element of particularism may consistently be willed as a universal law. The limits of this particularism are, however, quite tightly drawn. The value of a family to its members depends on a certain material base: formal autonomy without adequate resources is a cruel cheat. In a similar way, the picture of a world in which people have special obligations to compatriots loses its moral attractiveness unless each country has enough material resources to provide at least the basic essentials in the way of food, shelter, sanitation and medical care to its inhabitants (see International relations, philosophy of §§3, 4).

A utilitarian will have little difficulty in recognizing that, however inefficient the transfer process might be, a situation in which the richest fifth of the world's population is sixty times better off than the poorest fifth must be one in which utility would be increased by a shift in resources. The Kantian legacy leaves more room for interpretation. All that can be said here is that contemporary neo-contractarianism seems naturally to lead to an equally pressing obligation to shift resources from the richest to the poorest countries. Thus, if we imagine people from everywhere in the world, ignorant of their personal identities, meeting in a Rawlsian 'original position' to choose principles of global justice, we must regard it as inconceivable that they would not seek to guard against suffering the fate of the majority of inhabitants of the poorest countries (see Rawls, J. §1). And if we follow Thomas Scanlon's (1982) proposal that we ask what principles could not reasonably be rejected by people seeking agreement with others under conditions that ruled out the exercise of bargaining power, we would have to say that those from the poorest countries could reasonably reject principles giving rise to a world order that left so many living in degrading deprivation (see Contractarianism; Justice).

4 Problems with cosmopolitan justice

The absorptive capacities of poor countries set severe limits on the amount of global redistribution that would be possible. Nevertheless, let us suppose that cosmopolitan principles would require rich countries to transfer ten per cent of their incomes to poor ones. This would imply a tenfold increase in aid from the Scandinavian countries, and an increase of fifty times and more from the current laggards such as the UK and USA. It is widely assumed not only that this is 'politically infeasible' but that this infeasibility somehow casts doubt on either the premises or the reasoning process leading to the conclusion about what justice demands. Yet many countries must on the same criteria be judged grossly unjust domestically, and this is not normally felt to cast doubt on the conclusion. Is there any rationale for the difference in attitude?

Thomas Nagel, in *Equality and Partiality*, has argued that lying behind the 'political infeasibility' is a moral consideration: that people in rich countries 'have sufficient reason to resist if they can' a 'radical drop in the standard of living of [themselves] and [their] famil[ies]' (1991: 174). Nagel denies that this reason amounts only to 'pure selfishness', but all he claims is that 'personal interests and commitments' are relevant (1991: 172). It is, however, hard to see how any morally compelling commitments could not be met with a modestly reduced standard of living, so 'personal interests' (that is, the unwillingness to do what is just) seems to be all that is left. Even if some commitments such as private schooling or a car as a graduation present had to be abandoned, it seems grotesque to mention this in the same breath as the plight of parents in poor countries who have to watch helplessly while their children die of diseases caused by malnutrition and lack of sanitation.

For Nagel, international redistribution does not create problems that are distinctive in principle: 'some poor countries such as India and Mexico have wealthy minorities' who can, apparently, equally legitimately resist redistribution (1991: 170). Other people, however, seem to regard the problem of international justice as different. A possible rationale might run as follows. States have a coercive apparatus at their command which *could* be used to bring about justice even if it is not so used and (given the constellation of political forces) is in many cases not likely to be so used. There is no international agency with the coercive power to create international justice, even under ideal political conditions. This means that moves towards international justice will require voluntary action by governments. We cannot reasonably expect the electorates of rich countries to vote for politicians who promise if elected to take steps to reduce their standard of living significantly. But if we cannot reasonably expect somebody to do something, we can scarcely mount a serious criticism of that person for not doing it. This must suggest that failing to do it is not appropriately described as unjust.

This argument is manifestly a close cousin of the Hobbesian one dissected in §2 in the link it makes between motivation, institutions and justice. As before, we can respond that the correct conclusion to draw is that justice requires appropriate coercive institutions. If domestic taxation were purely voluntary, it would no doubt be regarded as unreasonable to expect people to pay a large proportion of their incomes to the government, yet nobody thinks much of governments taking in over forty per cent of the national income for the provision of public services and cash benefits. If rich countries could be coerced by an international organization, there would, similarly, be no reason for a tax rate of, say, ten per cent to be regarded as extraordinary.

The absence of such a coercive institution has meant that the populations of rich countries have had little self-interested motivation to correct the situation. However, as Annette Baier has argued, 'people grow more reckless of the lives of others as their own lives become more wretched, insecure, and intolerable' (1991: 34). And while it would be better in every respect if rich countries acted under their own momentum to transfer resources to poor countries, the development and proliferation of devastating nuclear and (relatively portable) chemical and biological weapons means that not to do so 'may be not just inhumanity [but] *folly* if the excluded do feel resentment and have power to make it felt' (1991: 54; original emphasis).

Justification, epistemic

The term 'justification' belongs to a cluster of normative terms that also includes 'rational', 'reasonable' and 'warranted'. All these are commonly used in epistemology, but there is no generally agreed way of understanding them, nor is there even agreement as to whether they are synonymous. Some epistemologists employ them interchangeably; others distinguish among them. It is generally assumed, however, that belief is the target psychological state of these terms; epistemologists are concerned with what it takes for a belief to be justified, rational, reasonable or warranted. Propositions, statements, claims, hypotheses and theories are also said to be justified, but these uses are best understood as derivative; to say, for example, that a theory is justified for an individual is to say that were that individual to believe the theory (perhaps for the right reasons), the belief would be justified.

Historically, the two most important accounts of epistemic justification are foundationalism and coherentism. Foundationalists say that justification has a tiered structure; some beliefs are self-justifying, and other beliefs are justified in so far as they are supported by these basic beliefs. Coherentists deny that any beliefs are self-justifying and propose instead that beliefs are justified in so far as they belong to a system of beliefs that are mutually supportive. Most foundationalists and coherentists are internalists; they claim that the conditions that determine whether or not a belief is justified are primarily internal psychological conditions (for example, what beliefs and experiences one has). In the last quarter of the twentieth century, externalism emerged as an important alternative to internalism. Externalists argue that one cannot determine whether a belief is justified without looking at the believer's external environment. The most influential form of externalism is reliabilism.

Another challenge to traditional foundationalism and coherentism comes from probabilists, who argue that belief should not be treated as an all-or-nothing phenomenon: belief comes in degrees. Moreover, one's degrees of beliefs, construed as subjective probabilities, are justified only if they do not violate any of the axioms of the probability calculus. Another approach is proposed by those who advocate a naturalization of epistemology. They fault foundationalists, coherentists and probabilists for an overemphasis on a priori theorizing and a corresponding lack of concern with the practices and findings of science. The most radical naturalized epistemologists recommend that the traditional questions of epistemology be recast into forms that can be answered by science.

An important question to ask with respect to any approach to epistemology is, 'what implications does it have for scepticism?' Some accounts of epistemic justification preclude, while others do not preclude, one's beliefs being justified but mostly false. Another issue is the degree to which the beliefs of other people affect what an individual is justified in believing. All theories of epistemic justification must find a way of acknowledging that much of what each of us knows derives from what others have told us. However, some epistemologists insist that the bulk of the history of epistemology is overly individualistic and that social conditions enter into questions of justification in a more fundamental way than standard accounts acknowledge.

1 Epistemic and non-epistemic justification

Decisions, actions, policies, procedures, punishments, laws, rules and host of other things can be justified or unjustified. They are justified only if there are adequate reasons for them, and unjustified if there are not. Epistemic justification is concerned with the justification of beliefs, and hence with reasons for believing. However, being epistemically justified is not simply a matter of having adequate reasons for believing, since there can be reasons for believing a claim that are not epistemic. If I offer you a million dollars to believe that the earth is flat, I have given you a reason to have this belief, but it is not an epistemic reason. The most controversial use of this point was made by Pascal and James, each of whom argued that we have such reasons to believe in God (see James, W. §4; Pascal, B. §6).

A straightforward way to understand the distinction between epistemic and non-epistemic reasons for belief is in terms of the end, or goal, that the reason aims at promoting. If *X* is a valuable end and if bringing about *Y* increases the likelihood of *X* occurring then, all else being equal, one has a reason to bring about *Y*. Different kinds of reasons are distinguished in terms of different kinds of ends. If *X* is an economic end, one has an economic reason to engage in *Y*. If *X* has broader pragmatic value - it improves your health, enhances your friendships and so on -

one has a more broadly pragmatic reason to engage in *Y*. Analogously, if *X* is epistemically valuable, one has an epistemic reason for *Y* (see Reasons for belief).

The question of what makes a reason an epistemic reason thus reduces to the question of what constitutes an epistemic end. A commonly accepted answer is that an end is epistemic in so far as it is concerned with believing what is true and not believing what is false. Once epistemic reasons are distinguished from non-epistemic ones, a question arises as to whether the latter can ever override former in cases where the two conflict. W.K. Clifford (1879), arguing against William James, said that they can not, claiming that we have an absolute obligation to believe only that for which we have adequate evidence. This is a difficult position to defend, however. Suppose a catastrophe could be avoided by believing a claim for which there is little or no evidence - for example, a terrorist threatens to detonate a bomb that will kill thousands of people unless you somehow get yourself to believe that the earth is flat. Clifford is committed, implausibly, to saying that under such conditions you have an obligation not to believe that the earth is flat.

Although it may be possible for non-epistemic reasons for belief to override epistemic ones, it is also rare. One explanation of its rarity is that even if we become convinced that we have non-epistemic reasons to believe a claim, this is ordinarily not enough to prompt belief. By contrast, if we become convinced that there is good evidence (that is, good epistemic reasons) for a claim, we usually automatically come to believe it. This suggests that if we are to acquire beliefs for which we realize we lack adequate evidence, we may have to go to extraordinary lengths. For example, one might have to resort to post-hypnotic suggestion or some equally extreme measure. However, such measures will typically have unfortunate consequences, especially since beliefs cannot be altered in a piecemeal fashion. Believing the earth is flat, for instance, will involve dismissing as misleading or fabricated a huge amount of information that on the face of it indicates that the earth is spherical. Dismissing such information in turn will adversely affect the overall accuracy of one’s belief system and with it the overall effectiveness of one’s decision making, with the likely result that one will be less able to achieve one’s goals in a wide variety of contexts. The lesson, then, is that except in the most unusual kinds of cases - the case of the terrorist, for example - the costs associated with an effort to get oneself to believe that for which one lacks adequate evidence will not be worth the effort. Thus, what we have reasons to believe all things considered - that is, when all our ends are taken into account - is usually identical with what we have epistemic reasons to believe.

2 Foundationalism and coherentism

According to foundationalists, epistemic justification has a hierarchical structure. Some beliefs are self-justifying and as such constitute one’s evidence base. Others are justified only if they are appropriately supported by these basic beliefs. Foundationalists differ among themselves as to what conditions have to be met in order for a belief to be basic and what conditions have to be met in order for other beliefs to be appropriately supported by basic beliefs. The strictest versions of foundationalism require that a belief be infallible, indubitable or incorrigible if it is to be self-justifying. A belief is infallible if it is impossible to have the belief and for it to be false; a belief is indubitable if it is impossible to doubt whether it is true; and a belief is incorrigible if it is impossible to have good reasons for thinking it is false. The strictest versions of foundationalism also impose stringent constraints on the support relation, restricting it to logical implication and enumerative induction; a non-basic belief is justified only if it is implied or inductively supported by one’s basic beliefs. Many of the most influential figures in the history of epistemology are strict foundationalists (for example, Descartes, Hume, Berkeley and Locke) as are many of the most important epistemologists in the twentieth century (for example, Russell, Ayer and Carnap).

Modest versions of foundationalism relax the requirements of justification. For a belief to be basic, it does not have to be infallible, indubitable or incorrigible, but it does have to be intrinsically probable; the fact that one has the belief must itself make it likely that the belief is true. Similarly, the support relation is broadened beyond logical implication and enumerative induction to include inferences to the best explanation and other support relations (see Inference to the best explanation; Theoretical (epistemic) virtues).

Another distinction is between those foundationalists who insist on objective conditions of justification and those who permit subjective conditions. For example, Foley (1993) argues that one’s basic beliefs are those that are noncontroversial for one to use as evidence, given one’s other beliefs and one’s own deepest epistemic standards. He adds that one’s other beliefs are justified in so far as one would agree on ideal reflection that one’s basic beliefs make them probable. This is a version of foundationalism, but it is a subjective version.

For the foundationalist, the reigning metaphor for epistemology is that of a building whose foundation of basic beliefs supports additional stories of non-basic beliefs. For the coherentist, the reigning metaphor is that of a web made up of, and deriving its strength from, mutually supportive beliefs.

According to coherentists, the primary objects of justification are not individual beliefs but, rather, belief systems. A belief system is justified if its component beliefs cohere in an appropriate way. Individual beliefs are justified by virtue of belonging to such a set of beliefs. Thus, for the coherentist, epistemic justification is a holistic notion rather than a hierarchical one. The picture is not of basic beliefs being intrinsically justified and then passing on their justification to other beliefs; it is, rather, of justification emerging when one's belief system hangs together, or coheres.

Nineteenth-century philosophers such as Hegel and Bradley were coherentists, and in the twentieth century it was critiques of foundationalism that led to a resurgence of coherentism. Especially influential was the work of Wilfrid Sellars, who argued that no belief is self-justifying; beliefs can be justified only by appeal to other beliefs. Sellars was particularly forceful in his criticism of what he called the 'myth of the given', which is the notion that beliefs about our own sense experiences cannot be mistaken, since these experiences are directly presented, or given, to us.

It was then a small step from the claim that no belief is self-justifying to a coherence theory of epistemic justification. The step was made with the help of the observation that at least some beliefs are justified by reference to other beliefs that are themselves justified. This observation invites the question 'what justifies these latter beliefs?', and if the answer is 'still other justified beliefs', we can ask of the latter, 'what justifies them?' If pursued, this line of questioning suggests there are only three different ways of thinking about the structure of epistemic justification. The first is that there is an infinite regress of justifiers. Belief *A* is justified by belief *B*, *B* is justified by *C* and so on *ad infinitum*. However, most philosophers have thought that if there is no way to stop this regress, none of the early members of the series is justified and scepticism is the result; nothing is epistemically justified (see Scepticism). A second option is the one endorsed by foundationalists; belief *A* is justified by belief *B*, *B* by *C* and so on until a self-justifying belief ends the regress. The critiques of Sellars and others caused many to reject this second option, and thus they seemed to be left with no option but to endorse circular justification of some sort. Belief *A* is justified by belief *B*, *B* by *C* and so on until we reach a belief that is justified by *A* and other beliefs early in the series. In other words, the set of beliefs is mutually supportive, with belief *A* being justified by beliefs that *A* itself helps to justify.

Coherence among beliefs is at least a matter of consistency. If a set of beliefs is inconsistent, it is impossible for all the beliefs in the set to be true, and hence they are not mutually supportive. However, consistency is not enough for coherence; beliefs that are altogether unrelated to one another are consistent, but they are not mutually supportive. Some coherentists, F.H. Bradley for example, suggest that mutual entailment is required for coherence; every member of a coherent set should be deducible from other members of the set. However, most coherentists propose far less stringent conditions. BonJour (1985), for example, thinks of coherence as more than mere consistency but less than mutual entailment; it comes in degrees, with the degree increasing with the number of inferential connections among the component beliefs of the set and decreasing with the number of unexplained anomalies.

An objection to coherentism is that even the minimal condition of coherence - namely, consistency - is not an absolutely necessary condition of justification. It is ordinarily epistemically desirable to avoid inconsistency, but sometimes the costs are too high. The case of the lottery can be used to illustrate this.

Imagine a lottery of a million tickets, and suppose you are justified in believing that the lottery is fair and as such has only one winning ticket. Suppose also you have no reason to distinguish among the tickets concerning their chances of winning. So, the probability of ticket number 1 losing is .999999, the probability of ticket number 2 losing is .999999, and similarly for each of the other tickets. Thus, you have extraordinarily strong reasons to believe of ticket number 1 that it will not win, and accordingly it seems that you are justified in believing this. If we deny that you are justified, we will be hard-pressed to claim that very many of your other beliefs are justified, since the chances of their being in error are at least as great. However, your position with respect to ticket number 2, ticket number 3 and right through to ticket number 1,000,000 is the same as your position with respect to ticket

number 1. So, if you are justified in believing that number 1 will lose, it seems that you are justified in believing this of each of the other individual tickets as well. But then, if you also justifiably believe that one ticket (you know not which) will win, you have justified but inconsistent beliefs. Hence, consistency is not an absolutely necessary condition of epistemic justification, contrary to what coherentists claim (see Paradoxes, epistemic §1).

3 Internalism and externalism

Most foundationalists and coherentists share a commitment to internalism. In its strongest form, internalism is the view that one can always determine by careful introspection whether one's beliefs are justified. A motivation for strong internalism - found in epistemologists as otherwise diverse as Descartes, Locke, Chisholm and BonJour - is that we have a *prima facie* duty to have epistemically justified beliefs. If so, we are *prima facie* blameworthy if we have unjustified beliefs. But then, internalists argue, we must have access to the conditions that determine whether our beliefs are justified. Otherwise, we could do our epistemic best and hence be blameless but still have unjustified beliefs (see Epistemology and ethics).

Modest internalism is any view that has epistemic justification supervening upon internal psychological conditions, whether or not these conditions are introspectively accessible to the believer. To say that epistemic justification supervenes on psychological conditions is to say that whenever a belief *p* is epistemically justified, there is a set of psychological properties β such that necessarily if one has β and believes *p*, then one's belief is justified (see Supervenience).

A number of epistemologists (for example, BonJour 1985; Chisholm [1966] 1989; Foley 1993 and Lehrer 1974) propose conditions of epistemic justification that are internal psychological conditions but that are also complex enough for it to be implausible to think that we can always determine by introspection whether or not they obtain. Such epistemologists are best regarded as modest internalists. By contrast, externalists insist that some of the key prerequisites of epistemic justification obtain outside the skin of the believer, for example, those concerning the believer's environment, history or social context.

Externalist accounts of epistemic justification are encouraged by the presupposition that when epistemic justification is added to true belief, knowledge is the result if there are no Gettier problems present (see Gettier problems). Alvin Goldman (1986) is an especially instructive figure in this regard. He was one of the earliest champions of a reliabilist account of knowledge. According to reliabilists, one knows that *p*, at least in the simplest cases, if one has a true belief *p* that is the product of a generally reliable cognitive process (see Reliabilism). With this account of knowledge in hand, Goldman argued that because epistemic justification is by definition that which has to be added to true belief to get knowledge, epistemic justification must essentially be a matter of one's beliefs having been produced by highly reliable cognitive processes. Since the reliability of a cognitive process is in part dependent on the external environment in which one is operating, this is an externalist account of epistemic justification.

Reliabilism is the most influential form of externalism, and the most influential reliabilists include Goldman, Dretske (1981), Armstrong (1973) and Sosa (1991). Despite their differences, these epistemologists share a commitment to the view that justification is basically a matter of there being a correct fit between one's environment on the one hand and one's cognitive processes and intellectual practices on the other, where a fit is correct if it has a tendency to produce true beliefs and not produce false beliefs. An offshoot of reliabilism is a view, championed by Alvin Plantinga (1992), that makes epistemic justification a matter of having beliefs that are the products of a properly functioning cognitive system, where a system is properly functioning if it is functioning in the way it was designed to function (either by natural selection or God) in the environment that it was designed for.

The disputes between internalists and externalists illustrate that the notion of epistemic justification is used by epistemologists in different senses. One way to determine how the notion is being used is to inquire whether the epistemologist is assuming that justification is by definition what has to be added to true belief in order to get a serious candidate for knowledge. Many externalists have been explicit about defining justification in this way. For others it is an implicit working assumption; if a proposed account of justification is such that justified true beliefs are not always good candidates for knowledge, the proposed account is for that reason inadequate. By contrast, many internalists understand justification in some independent way, leaving it an open question whether

justification when added to true belief generates a serious candidate for knowledge.

Confusion can occur when epistemologists use the notion in more than one way. For example, they may want to think of epistemic justification in terms of what a responsible believer would believe and also in terms of what has to be added to true belief to get knowledge. Confusions of this sort are not entirely unexpected, given that some of the most influential figures in epistemology have thought that one and the same notion could capture both ideas. Descartes and Locke, for example, were concerned with what is involved in being a responsible believer, and each thought that this was in large part a matter of believing only that for which we have adequate (internal) evidence. However, they also thought that by being responsible believers, we can be assured of acquiring knowledge.

Few epistemologists are so sanguine any more, but the lesson is not that the one or the other aspect of Cartesian and Lockean projects have to be abandoned. The lesson, rather, is that there are different projects for epistemologists to pursue. One project, roughly put, is to explore what is required for us to put our own intellectual house in order. Another is to explore what is required for us to stand in a relation of knowledge to our environment. It is not unnatural to report the results of both kinds of exploration using the language of justification and rationality, given the history of these terms. But this means, in turn, that the terms have distinct senses, one tending to be externalist, objective and closely connected with knowledge, the other tending to be internalist, more subjective and closely connected with responsible believing.

4 Probabilism

Whereas reliabilism is an externalist alternative to traditional foundationalism and coherentism, probabilism is an internalist alternative. Probabilists note that one's doxastic options with respect to a proposition are not limited to believing it, disbelieving it or withholding judgment on it. Rather, one can have varying degrees of belief, or confidence, in the truth of a proposition. Probabilists often add that these degrees of belief can be represented as subjective probabilities, with a subjective probability of 1 representing maximum confidence in the truth of a proposition, a subjective probability of 0 representing no confidence in its truth, and the numbers in the interval (0,1) representing degrees of confidence between the two extremes. Probabilists then argue that one's degrees of belief must be coherent if they are to be justified, and that they are coherent if they obey the probability calculus.

Consider some simple examples. According to the probability calculus, a proposition can be no more probable than a proposition it implies. Thus, if *P* implies *Q* and if one believes *P* with more confidence than *Q*, one's degrees of belief are incoherent and hence unjustified. Similarly, if *P* and *Q* are mutually exclusive propositions - that is, if it is not possible for both to be true - the probability of (*P* or *Q*) is equal to the probability of the first disjunct plus the probability of the second disjunct. Suppose, then, that one believes *P* with degree of confidence *x*, *Q* with degree of confidence *y*, and the disjunction (*P* or *Q*) with degree of confidence *z*. If $z \neq x + y$, one's degrees of belief are incoherent and as a result unjustified.

'Dutch book arguments' are sometimes used by probabilists to illustrate the undesirability of having incoherent degrees of belief. These arguments establish that if you are willing to post betting odds on the truth of propositions in accordance with your degrees of belief - for example, if you are twice as confident of the truth of *P* as you are of its negation, you are willing post 2:1 odds on the truth of *P*, giving an opponent the option of betting on *P* or against it - you will be vulnerable to having someone make a dutch book against you if your degrees of belief are incoherent. A dutch book is made against you when your opponent makes a series of bets such that you will suffer a net loss no matter how the events you are betting on turn out.

The most influential form of probabilism is Bayesianism, which proposes both an account of synchronic rationality (what is required for one's degrees of belief to be justified at any given moment) and also an account of diachronic rationality (what is required for one's degree of belief to change rationally over time). With respect to former, Bayesians insist on coherence. With respect to the latter, they insist that one should modify one's beliefs over time, in response to new information, in accordance with Bayes' Theorem (see Probability theory and epistemology).

One advantage of probabilism is that it sidesteps the lottery problem. Probabilists simply observe that it is rational to have a high degree of belief in the individual propositions in the lottery - that ticket number 1 will lose, that ticket number 2 will lose and so on - but an extremely low degree of confidence in the conjunction of these propositions, a conjunction that is equivalent to the proposition that no ticket will win. They are then free to leave

the matter at that, without having to decide whether it is rational to believe *simpliciter* the individual propositions.

Nevertheless, the most persistent objection against probabilism is analogous to the objection that the lottery problem raises for traditional coherentism. Most generally expressed, the objection against traditional coherentism is that sometimes we can be justified in having beliefs that we know are less than ideally accurate. In particular, we can be justified in having beliefs that we know to be inconsistent and hence that we know cannot all be true. Similarly, we sometimes can be justified in having degrees of belief that we know are incoherent and hence cannot possibly reflect the objective probabilities. The clearest examples are non-contingent propositions, whose objective probability we know is either 1 or 0. For example, Goldbach's conjecture, which asserts that every even number can be expressed as the sum of two primes, is either necessarily true or necessarily false. If the former, it has an objective probability of 1, if the latter, it has an objective probability of 0. But since the conjecture has never been proven or disproven, we can be justified in having a degree of belief in the conjecture that is neither 1 nor 0.

5 Naturalized epistemology

Naturalized epistemology is the name given to a cluster of views that insist upon a close relationship between epistemology and the practices and findings of science. Naturalized epistemologists criticize foundationalists, coherentists and probabilists for their overemphasis on a priori theorizing. If we want to know how cognition actually works, why it is usually reliable, and when it has a tendency to go wrong, they say we need to turn to science. Psychology and neurobiology can tell us how cognition works; biology and especially evolutionary theory can provide us with an explanation as to why cognition is generally reliable; and cognitive psychology can give us information about the kinds of intellectual mistakes we have a tendency to make, so that we can guard against them.

Quine (1969) coined the phrase 'naturalized epistemology' and is one of its most influential proponents. In his most trenchant moments, he recommends that epistemology should become a chapter of psychology. This is to be accomplished by recasting the traditional questions of epistemology into forms that can be answered by psychology. For example, the question 'Does sensory experience give us good reasons to have beliefs about the external world?' is replaced with 'How do sensory experiences in fact cause us to believe what we do about the external world?'. The idea is to make epistemology a part of natural science and hence, in Quine's view, respectable.

In this radical form, naturalized epistemology threatens to become non-normative. It describes how a relatively restricted sensory input produces a rich array of beliefs, but it does not assess which procedures, methods and practices we are justified in using. Naturalized epistemologists, including Quine himself, have been eager to respond that they are not abandoning the normative element within epistemology. One response, emphasized by Alvin Goldman (1986), is that a naturalized approach to epistemology can coexist comfortably with a reliabilist account of epistemic justification. Epistemology, on this conception, is normative, since it tells us we are justified in employing an intellectual procedure, method or practice in so far as the practice is reliable; but it is also naturalized, since science that tells us which procedures, methods and practices are reliable.

6 Scepticism

One way of marking differences among various epistemological theories is to ask what, if anything, does the theory imply about radical sceptical hypotheses, which imply that most of one's beliefs are mistaken, not just in detail but seriously mistaken. For example, the evil demon hypothesis, which Descartes tried to refute, is that unknown to me I am under the control of a demon who is manipulating me and my environment in such a way that almost all my beliefs about the external world are false. Such hypotheses seem far-fetched, but they do illustrate in a dramatic way what seems to be a legitimate question, namely, whether or not our beliefs might be largely in error.

In so far as naturalized epistemologists feel free to bring the findings of science to their epistemologies, they are presupposing the falsity of such sceptical worries. By contrast, reliabilists can be neutral about sceptical hypotheses. They assert that our beliefs must be the products of reliable cognitive processes in order to be justified, but they need not take a stand on whether the cognitive processes we actually employ are reliable. Strong foundationalism purports to provide a refutation of sceptical hypotheses. Descartes, for example, thought that his

method of doubt could establish with certainty a set of truths, including the existence of a benevolent and omnipotent God, which could then be used to disprove the evil demon hypothesis and other such sceptical hypotheses (see Descartes, R. §4). Modest versions of foundationalism are usually regarded as more plausible than Descartes' version, but they also provide correspondingly weaker responses to the sceptic. The same is true of coherentism; it is difficult to argue that it is altogether impossible for coherent beliefs to be drastically mistaken.

One stance to take towards sceptical worries, available to coherentists, moderate foundationalists and reliabilists alike, is to concede that it is part of our human intellectual predicament that such worries cannot be definitively banished; we have no choice but to live with them and the uncertainty they entail. It has proved difficult for epistemologists to be content with this uncertainty, and this in turn has motivated attempts to show that sceptical worries are self-referentially incoherent. The argument is that, in raising radical worries, would-be sceptics inevitably make use of the very intellectual faculties and methods about which they are raising doubts. In doing so, they are presupposing the general reliability of these faculties and methods. Hence, it is incoherent for them to entertain the idea that they might be unreliable. An objection against this anti-sceptical argument is that it fails to appreciate that the argumentative strategy of sceptics can be entirely negative. Their aim need not be to establish any positive thesis, not even the thesis that our faculties and methods are untrustworthy. Rather, their strategy can be to assume for the sake of argument that our favourite faculties, procedures and methods are reliable, and then to illustrate that these faculties, procedures and methods, if applied rigorously, will generate evidence that undermines their pretence of reliability.

Another anti-sceptical position is that sceptical hypotheses are metaphysically impossible. For example, Davidson (1986) argues that the nature of belief is such as to rule out the possibility that our beliefs are largely in error since, at least in the most simple cases, the objects of our beliefs are the causes of them. Hence, our beliefs must be largely true (see Davidson, D.). In a similar spirit, Putnam (1987) argues that, in thinking about the world, it is impossible to separate our conceptual contributions from what is 'objectively there', and that plausible theories of reference and truth must acknowledge this impossibility. But in turn, Putnam says, this implies that the world cannot be entirely different from what our beliefs represent it to be (see Putnam, H.).

Such theories of truth, belief and reference are interesting and debatable as metaphysical positions, but for the purpose of laying sceptical worries to rest they are of limited value, especially since the intricate arguments used to defend these theories are themselves subject to sceptical doubts. Regardless of how we marshal our intellectual resources, there can be no non-question-begging assurances that the resulting inquiry is reliable, and this applies to metaphysical inquiries into the nature of truth, belief and reference as much it does to any other kind of inquiry.

7 Testimony and social epistemology

Another issue that marks differences among various approaches to epistemology is the degree to which the beliefs of other people enter into questions of what an individual is justified in believing. It is not seriously debatable that much of what each of us believes derives from others. So, all theories of epistemic justification must find a way to acknowledge the social interdependence of knowledge and justification. What separates epistemologists is how to do justice to this interdependence.

One way is to focus on the importance of testimony in our intellectual lives. A historically important approach to testimony, associated with Hume, claims that we all have good inductive reasons for thinking that others are reliable. Hence, we are generally justified in relying on what others tell us. There are at least two problems with this approach. First, it does not seem adequate to the breadth and depth of our dependence on others. As children, we acquire a huge set of beliefs from others, mostly without thought and long before we have the capacity to judge whether we have inductive reasons to trust them. Second, it is notoriously difficult to reconstruct the good inductive reasons we are supposed to have for trusting others. We rely on the testimony of strangers whose track record for truthfulness is unknown to us. Similarly, we rely of the opinions of experts in fields of inquiry about which we know so little that we are unable to verify reliability of the experts.

Another approach is to claim that we are always *prima facie* justified in accepting the testimony of others, even when we do not have good inductive reasons for trusting them. This approach is associated with Thomas Reid, who said that we all have a sense of credulity which disposes us to believe what others tell us. Reid regarded credulity as a cognitive faculty, analogous to vision, hearing, touch and memory. We are born with this faculty

and, like other native cognitive faculties, we are justified in relying on it unless problems arise, that is, unless we have concrete reasons to distrust it (see Reid, T.).

A third approach is that, in so far as I am entitled to trust in general my own cognitive functioning, I am also entitled to trust in general the cognitive functioning of others, since their cognitive faculties are broadly similar to mine and likewise their environment is similar to mine. This is not to deny there are important differences among people and their environments, but the differences arise against an enormous backdrop of similarity. Thus, it would be incoherent for me to trust my cognitive functioning unless I am also willing to trust that of others; consistency demands this.

Some epistemologists insist that all the above approaches are overly individualistic, since they try to account for the social interdependence of justification by focusing on how individuals should treat the testimony of others. Social conditions enter into questions of justification in a more fundamental way than this, these critics say. For example, a position hinted at by both Wittgenstein and Rorty is that one is justified in believing *p* only if the manner in which one comes to believe *p* is intellectually acceptable in one's community (see Wittgenstein, L. §12; Rorty, R.M.).

A claim that has even more radical implications for epistemology is that the target states of epistemic justification are not the beliefs of individual people but rather the opinions of social groups, where these opinions cannot be reduced to the opinions of the individuals comprising the group. The beliefs of individuals are justified only in a derivative sense. Either they belong to the set of opinions justifiably held by one's community, or they are appropriately related to this set of opinions.

Justification, religious

Justification is about the restoration of human beings after Adam's Fall, by the life, death and resurrection of Jesus, and the beginning of a new life that anticipates the glory of heaven. According to the Roman Catholic Church, justification has two aspects: forgiveness of sin and the infusion of grace that makes Christians just (innocent). It is the beginning of a new life of grace, in which the gifts of faith, hope and charity enable one to perform meritorious works. However, the restoration is never complete in this life and concupiscence remains; a fall from the state of grace is thus possible, but this is reversible through penance.

A central feature of the Protestant Reformation was a dispute with the Roman Catholic Church over how justification should be understood. According to Luther, one does not become renewed (innocent) in justification. Rather, one is forgiven because the righteousness or justice of Christ is imputed to those who have faith in God's promise of redemption; however, one remains a sinner. More recent thought, however, has pointed to the fact that in both Lutheran and Catholic conceptions of justification, there is a sense of incompleteness, that it is just part of the process of redemption. There has also been interest in the idea of justification involving an indwelling of God rather than a gift from God to the individual; this has interesting affinities with Eastern Orthodox beliefs.

1 The Bible

In the Old Testament the word 'justification' has a juridical connotation. It refers to the obtaining of justice for one who is unjustly accused, whereby they are vindicated or shown to be not guilty. Quite often the context is one in which the innocence of a person before God is made plain by God through a public tribunal.

One exceptional but important use is in Isaiah: 'The righteous one, my servant, shall make many righteous, and he shall bear their iniquities' (53: 11). A servant by his suffering death obtains pardon and remission of sin for others. His suffering justifies, makes the guilty righteous. If this passage is interpreted in terms of the juridical understanding of justification, it must mean that the guilty are actually made innocent. In the New Testament, Jesus is identified as the suffering servant, whose life, death and resurrection justify the sinner.

Jesus used the term 'just' in a very wide sense to mean a life of innocence or holiness before God. For him, the righteousness of the kingdom of God was very different from that of the Pharisees. In one parable, a Pharisee thanks God for his freedom from sin, while a tax collector prays for God to have mercy for his sinfulness; 'I tell you, this man went home justified rather than the other; for all who exalt themselves will be humbled, but all who humble themselves will be exalted' (Luke 18: 9-14). In the parable of the prodigal son (Luke 15: 11-32), Jesus made it clear that God seeks a deep bond of love, not just external conformity, as the basis of his relationship with both the prodigal and the conventional son. Covenant, a sacred relation established by God, precedes law, and is the foundation of life with God, rather than conformity to law apart from the covenantal relation.

According to Paul, who explicated Jesus' teaching on justification more systematically than any other biblical writer, the insistence that Gentiles (non-Jewish converts) should observe the Jewish law threatened to destroy the new covenant established by Jesus. The controversy forced Paul to explore more deeply the significance of Jesus' death and resurrection: 'We ourselves are Jews by birth and not Gentile sinners; yet we know that a person is justified not by the works of the law but through faith in Jesus Christ' (Galatians 2: 15). Life in God is the acceptance of the gratuitous gift of justification through faith in Christ. The justified believer lives a new life because they are united with the risen Lord.

2 Augustine

Augustine's teaching on justification had far-reaching influence in the Latin (Western) Church (see Augustine §6, 13). It was occasioned by the teachings of Pelagius, who denied that one needed divine grace to do good and right (see Pelagianism). This denial of original sin, and hence of the need of redemption through Christ, aroused Augustine to reaffirm that all are born in sin and cannot become just except through the grace of Christ. God saves those who would justly be condemned. All the initiative in justification comes from God, so that free cooperation with God in justification (manifest in faith, hope and charity) is possible only by God's grace. Later, Augustine rejected semi-Pelagianism, in which it was taught that God's justification awaits a person's good action. Augustine stressed that a person's very assent to the message of salvation is God's gift. Grace is necessary to restore free will

(see Grace).

Augustine set the terms for the discussion of justification in the Western Church. The way the medieval Church developed Augustine's views on the remission of sin and good works led Luther to reject its teaching on justification. Augustine's stress on the total gratuity of justification led to controversy among Calvinists and to a deep division between Calvinists and Methodists over the role of free will; it also gave rise to the Jansenist controversy within Roman Catholicism in the seventeenth century.

3 Medieval theology

Medieval theologians agreed with Augustine that there are two aspects of justification: forgiveness of sin and an infusion of grace that overcomes one of the effects of the Fall, so that one becomes in fact just or innocent. The gift of integrity, whereby appetites are fully controlled by reason, is not given. Concupiscence therefore remains, but, as Augustine taught, it is not itself sin and there is room for growth in the gifts of faith, hope and charity; one can move towards integrity. Justification can be lost by mortal sin, but can be regained through the sacrament of penance.

Divisions occurred over the relation between the two aspects of justification, forgiveness of sin and the infusion of grace. They were prompted, in part, by the scholastic desire for precision, and this discussion of justification has the flavour of academic speculation, rather than of practical and pastoral concerns as in Augustine. The application of Aristotelian philosophy, particularly the notion of change in terms of formal and material causality, to theological issues shaped the way the question of the two aspects of justification was treated.

There were two primary schools of thought regarding the changeover from the state of sin to the state of grace. According to Aquinas, there is a necessary connection between the forgiveness of sin and the infusion of grace, or between forgiveness and restoration to a condition of justice or innocence. This stems from Aristotle's notion of one form replacing another form: the change involves the form of grace expelling the form of sin. Both aspects of justification occur together because they are necessarily connected to the reception of the form of grace.

The other school of thought rejected this Thomist intellectualism in favour of the primacy of divine will. Duns Scotus said that forgiveness of sin and infusion of grace are connected in fact because of God's will, but not by their nature. William of Ockham went even further by saying that not only is God's decree or will the only reason for the actual connection of forgiveness of sin and the condition of grace, but that there would be no logical contradiction if they were not connected, so that God could decree one without the other (see William of Ockham §10; Voluntarism).

It is generally held by Roman Catholic theologians that Duns Scotus' voluntarism and Ockham's nominalism, by rejecting any intrinsic connection between remission of sin and grace, enabled Martin Luther to claim that in justification people remain sinners. That is, when forgiven by God, people remain sinners, but God declares that they are just. However much Luther may have been influenced in his theology by voluntarism and nominalism, he appealed to Scripture for his views on justification. This is also true of later reformers, such as John Calvin (§4).

The sixteenth-century Council of Trent by and large endorsed the Thomistic view of justification. Justification implies an actual removal of sin, not a pardon of sin only (a mere forensic declaration by God that one is forgiven, but with sin still remaining). There is an interior renewal by the infusion of grace, whether or not it is experienced psychologically.

4 Luther

Luther's view that in justification one is *simul iustus et peccator* (both just and sinner) does indeed mean that for him justification is forensic (not an actual regeneration). Because of Christ, God does not impute one's sins to one and so remits punishment. One is not internally renewed or made pure, but is saved by faith in God's promise in Christ to bring his followers into his eternal kingdom. Since one is saved unconditionally, there is no role for good works in the attainment of salvation. Good works flow from one's faith.

Luther's views on justification can easily be misconstrued by both Roman Catholics and Protestants if his approach is not kept firmly in mind. Luther believed that he was following Paul in stressing that one is not justified *according* to the law, but *apart* from the law. According to the law, all are sinners. But by imputing Christ's

righteousness to sinners, God forgives them and declares them to be just. In relation to God, but not according to the law, they are just. *Simul iustus et peccator* is to be understood in the context of a justification *apart* from the law. If one retains the framework of justification according to the law, then one can understand the reasoning that insists that one must have undergone a total inner transformation, for only so can one actually be just according to the law. But for Luther this means retaining the Old Testament principle noted in §1 above, namely that in justification the person who is justified is found to be innocent of sin. For Luther, to claim that in justification one becomes inherently innocent of sin by the infusion of grace is to remain within the context of justification according to the law. None the less, he insists that the law is not abolished and that one is not to become lawless; rather, one is justified apart from the law.

Luther's approach does not settle the question of whether the two aspects of justification, forgiveness of sin and total renewal, can be separated, as he and Ockham (for different reasons) claimed. But to understand Luther's approach enables one to see more accurately the differences between the Roman Catholic Church and Luther. According to the Roman Catholic Church, one is made pure (innocent) by infused grace, and one is just or justified because one is innocent. According to Luther, one is saved or justified by faith in God's forgiveness in Christ, not because one is innocent. He claimed that the need to insist that one is actually innocent is because justification is conceived within the framework of the law, even though the alleged innocence is achieved by infused grace. For both Luther and the Roman Catholic Church, good works are only possible because of divine grace, but for the Church, good works are needed because one must actually be good to deserve justification. For Luther, good works flow from our justification.

Protestants have frequently failed to grasp properly Luther's approach. The stress that justification is by faith alone, a completely gratuitous gift, led Protestants to wrestle in various ways with the question raised by Paul in Romans 6: 1. After Paul has explained that one is justified apart from the law, he asks 'Should we continue in sin in order that grace may abound?' If God has done everything for one's salvation, what is there for one to do? Why should one obey the law? Protestants have oscillated between laxity, on the ground that justification is apart from good deeds, and rigorism, on the ground that since good works flow from one's faith, unless one performs them, one cannot have been saved.

The tendency to laxity stems from a failure to see that, for Luther, justification is the *beginning* of renewal or inner transformation by the Holy Spirit. (Seeberg (1961) and Forde (1984) insist that, for Luther, justification is the beginning of holiness.) To infer from justification apart from the law that one is to be lawless is to repudiate justification itself, since justification is the beginning of the reception of God's promise in Christ eventually to establish his kingdom or rule in his followers. Rigorism, in its reaction to lawlessness, lapses into the framework of justification according to the law.

5 Possible reconciliation

Recent post-Tridentine and ecumenical thought has softened the opposition between Roman Catholicism and the Protestants who, in various denominations, follow Luther's teaching on justification. In the Roman Catholic view, justification does not deliver one wholly from the effects of the Fall because concupiscence, which inclines one to sin, remains. It is also clear that Luther's claim that in justification one is *simul iustus et peccator* includes the notion that justification is the beginning of one's renewal (holiness). Since in both views of justification there is newness and incompleteness, the difference is not absolute.

The Roman Catholic Church is now raising into prominence the teaching of the indwelling or the presence of God in one's salvation. The earlier stress on infused grace tended to overlook the fact that such grace is relative to or linked to the divine presence (uncreated grace). The stress on infused grace enabled one to focus on one's condition in isolation, so that even though one's state of grace and good works are possible only because of infused grace, one's state and deeds are one's own and are meritorious. The indwelling of God mitigates such an overly external relation between God and those whom God sanctifies. One's state and one's good works are the result of the continuing presence of God, so that one can never attend to oneself apart from God.

Among the Fathers of the Eastern Orthodox Church, for whom the indwelling of God and one's elevation into the life of God are central, there are no controversies over justification. Some Roman Catholic theologians (such as Garrigou-Lagrange 1957 and Congar 1962) are aware that their recent emphasis on the central concerns of the

Orthodox Fathers has important ecumenical promise, not only for their relation to Orthodoxy, but also for their relation to those Protestants who are increasingly aware that Luther's view of justification may be harmonious with that of the Fathers. In time, there may be a growing convergence of opinion, not only on justification, but also on the nature of the Christian life.

Justinian (AD 482-565)

There was a late Roman renaissance during Justinian's reign in the sixth century AD. Its high point was the compilation by his minister Tribonian of a huge restatement of Roman law in four works, the Institutes, Digest, Code *and* Novels*, preserving a selection of its achievements. Called by medieval lawyers the* Corpus iuris civilis*, it is the basic material for studying Roman law and the source of much of Europe's legal thinking.*

Born Petrus Sabbatius in Macedonia, Justinian (Iustinianius Flavius) became Emperor at Constantinople in 527. Eager for fame, he wanted to restore and renew the Roman world. His generals reconquered the western empire while his architects adorned the capital with buildings such as St Sophia. Roman law, too, represented the glorious past: his minister Tribonian was put in charge of an elaborate programme for its restatement.

This began in 529 with the first *Code*, a collection of earlier imperial enactments, superseded in 534 by the second and only existing version. Subsequent legislation by Justinian and others is preserved in a sixth-century compilation called the *Novels*. The *Digest*, begun in 530 and completed, according to Bluhme's theory (1820), by three committees working furiously in parallel in only three years, was Justinian's largest work, about one and a half times the size of the Bible. An anthology of excerpts from the great jurists of the classical age (*c*. 50 BC to AD 250) such as Papinian, Paul, Ulpian and Gaius, it contains virtually all that has survived of them (see Gaius). However, its compilers could and did change the original texts: scholars have been pointing out these 'interpolations' for centuries.

Though providing a ready-made law library in one book, the *Digest* was a vast and shapeless collection, in which the detailed rules on any topic were hard to find and fit into an overall pattern. Justinian's *Institutes*, a short introductory textbook published in 533, was an attempt to solve this problem for first-year law students at Constantinople. It was largely a second edition of the classical *Institutes* of Gaius, from which it took its so-called institutional order and much of its contents, with later reforms tacked on to each section.

Justinian intended his restatement to be final, with further commentary banned. But medieval and later scholars in Europe called it the *Corpus iuris civilis*, the basic source-material for an enormous body of secondary literature on Roman law (see Legal hermeneutics §1). These studies were the starting point for much of Europe's legal thinking. Through them most European countries experienced a 'reception' of Roman law, becoming what are called civil law systems. Typically the *Digest*, *Code* and *Novels* supplied them with many specific rules and institutions, while the *Institutes* provided a clear scheme for systematizing and later codifying their law. Whatever its imperfections, Justinian's compilation gave the world Roman law (see Roman law).

Kabbalah

Kabbalah is the body of Jewish mystical writings which became important at the end of the twelfth century in Provence and has been taken up with varying degrees of enthusiasm in an attempt to explore the esoteric side of Judaism. There are two main forms of Kabbalah: one which concentrates on gaining knowledge of God through study of his name, and a theosophical tradition that approaches God through his impact on creation. On both accounts God is linked to the world through ten Sefirot, *hypostatic numbers which mediate between the Infinite and this world and thus (among other functions) help to explain how a being who is entirely ineffable can produce so much variety as is observed in nature. God's willingness to relate to the world gives his creatures the possibility of personal knowledge of him, although this can be acquired only through difficult and strenuous spiritual exercises. The variety of works which the Kabbalists produced are a blend of philosophical and mystical ideas which attempt to explore the inner meaning of faith and represent a creative and influential stream that both draws upon and contributes to Jewish philosophy.*

1 The nature of Jewish mysticism

There are broadly two types of mysticism within the Jewish tradition. One identifies mysticism with esoteric knowledge and links mysticism with philosophy. This provides the adept with access to a level of understanding unavailable to ordinary believers. The mystical knowledge is passed on from teacher to student, generally orally. In some cases, however, there is a gnosis that is achieved through some variety of divine revelation. Reliance on esoteric teachings and privileged gnosis is not taken to show that the traditional Jewish texts such as the Torah are not themselves sources of deep insight into the nature of reality. But the Kabbalistic tendency is to assume that such texts need to be interpreted in the right way if their inner essence is to be extracted. For this the reader needs a key, which Kabbalah (literally, tradition) can provide, through the appropriate training, to those capable of grasping it.

The other type of mysticism places the emphasis on experience, in particular ecstatic experience. The route to this experience is frequently allied to magic. It may involve the recitation of the divine name, specific rituals or particular types of meditation.

Study of the Kabbalah has often been controversial. Some who saw the Torah as consisting of secrets felt that once they understood these secrets they need no longer obey the laws. And there were a variety of heresies that challenged orthodoxy by the interpretations that they put on mystical experience.Yet within certain Jewish communities of great piety the Kabbalah became widely popular, especially because of its claim to elucidate (and facilitate) the linkage between this world and the divine. The ideas of the Kabbalah were also taken up by a variety of Christian thinkers who were interested in mysticism. These included Ramon Lull, Pico della Mirandola, Agrippa Von Nettesheim and Henry More.

2 Merkavah and Hekhalot mysticism

Merkavah (chariot) and Hekhalot (palace) mysticism have a common form. They deal with accounts of the ascent of the individual through the celestial realms, and end with the attainment of an ecstatic vision of the throne in the seventh palace of the seventh heaven. The reference to the chariot comes originally from the Book of Ezekiel, where the prophet describes his vision of the glory of the enthroned Godhead. Descriptions of this experience frequently refer to the experiencing (or perhaps better, the experiencing again) of God at Sinai, one of the crucial revelatory episodes in Judaism. There are two linked features of this form of mysticism. There is the ascent which results in a mystical experience, and there is also the acquisition of the angelic powers, perhaps through the adept's clothing himself with the divine name.

The notion of experiencing God is problematic in a religion like Judaism, with its frequent emphasis on God's transcendence. Thus there arises an interesting tension in Jewish mysticism, with its aim of seeing a God who at the same time cannot be seen. One way of addressing this tension is through poetic discourse that characterizes the mystical experience in erotic terms. Thus, the throne is often represented as female and the glory on it as male, so that the successful mystic makes contact with the holy union that lies at the core of reality.

What is the process by which mystics attain their experience? They progress through the seven heavens of Jewish

cosmology and the six palaces of the last and seventh heaven, and then enter the seventh palace, where the last throne exists. They stand before the enthroned glory and repeat the appropriate words with the angels. This may give them access either to the throne of glory itself or to a neighbouring throne. There they have a vision of the shining form of God. Although they never become the same as God, they do acquire some of the divine characteristics - spiritual or angelic properties. Angels participate in both divinity and humanity and thus permit the mystic to approach God without becoming God. Once mystics acquire angelic properties (through purification and asceticism), they can understand the hidden nature of reality, which was not available to them in their mundane existence.

3 God as a physical being

One of the aspects of God which the mystic is, in principle, capable of grasping is his physicality. Usually this is not expressed in terms of the asciption to God himself of physical proportions. But such proportions are ascribed to a secondary power, sometimes called the Metatron. This device enabled mystics to provide a visionary interpretation of the Talmudic notion, for example, that God wears phylacteries (Berachot 6a). It also allowed them to weave a visual symbolism on verses such as ‘Let us make man in our image’ (Genesis 1: 26). Such verses could not apply unproblematically and literally to God himself, since God transcends physicality. But they could be applied to a lower, angelic being who shares some physical characteristics with creatures. There were many different calculations of the size of God and the Metatron, based on the numerical values of Hebrew letters in crucial biblical passages (see God, concepts of).

4 Esoteric cosmology

The outstanding Kabbalistic work that deals with cosmology is the *Sefer Yetzirah (The Book of Creation)*. The work has obviously experienced changes and accretions over the centuries, but it seems to have been constructed between the third and ninth centuries. Its main assertion is that the scope for divine creativity involves the thirty-two paths of wisdom which make up ten basic forces (Sefirot) and the twenty-two letters of the Hebrew language. The Sefirot are to be seen as the attributes of God. They are sometimes identified with the heavenly creatures who support the throne. The notion of Sefirot helps the mystic understand the concept of God as enthroned, surrounded by his power. The Sefirot have a neo-Pythagorean origin, so it is natural for them to be identified with numbers, but they are also the basic constituents of physical matter; and they can be equated with other elemental notions, such as east, west, south, north, height, depth, good, evil, the end and the beginning. They are thus the underlying principles of the temporal, spatial and moral order of the world. Accordingly, they are sometimes seen as the four directions, spirit, water, fire, height, depth and the divine spirit. A common representation of the Sefirot takes the form shown in the figure.

Keter (crown)
Binah (understanding) Chochmah (wisdom)
Din (judgment) Chesed (mercy)
Tiferet (beauty)
Hod (splendour) Netzach (victory)
Yesod (foundation)
Malchut (kingdom)

The first triad of the Sefirot represent thought, understanding and wisdom, the three intellectual aspects of the first emanation. The first nine are regarded as masculine, while the last, kingdom, is identified with the *shekhinah*, the divine presence, immanence, or indwelling, and is feminine. The divine powers present in the Sefirot are part of the continuous process of emanation, by which the world is created.

The Sefirot represent the expressivity of divine creation. Tzimtzum (contraction) is the divine self-contraction - for the differentiation brought about by God also implies not only emanation but also limitation. The Sefirot represent the capacity to create. But Tzimtzum is the precondition of that creation. For without self-limitation, God would not be able to enter into relationship with us. Sometimes this idea of divine self-limitation is expressed in terms of the divine light’s having to go into vessels in order to be weak enough to make contact with mortal creatures. Unless God were prepared to limit the extent of the light, it would not be suitable for the finitude of creation but would overwhelm all that was to be with the divine effulgence. Creation and revelation are parallel here. So the

specificity of the divine Law is another outcome made possible only by divine self-limitation. Furthermore, since God is infinite, when God creates he does not create something outside of himself. Rather, he makes room within his own self for a greater diversity. Isaac Luria (1534-72) argued that the vessels in which the light is restricted represent the commandments (*mitzvot*) of the Torah. God's restricting himself to the commandments does not bring him into the power of human beings, nor does it confine him under the categories which apply to our notion of how things are. His self-limitation is an internal action, and the appropriate response of human beings is to carry out his laws in order that we may become colleagues with God in an inner sphere of activity. As an ineffable and infinite being, God transcends multiplicity while at the same time linking himself to everything through the Sefirot. He freely chooses, through self-contraction to allow multiplicity to emerge. This gave the Kabbalists an interesting route to reconciling freedom with divine omniscience. God could know what was going to happen in the future, but he wills not to, in order to allow human beings to make their own decisions freely (see Omniscience).

One intriguing aspect of the *Sefer Yetzirah* is its discussion of letter symbolism as both the form of divine creativity and the content of reality. A thing is brought to life through the appropriate combination of letters, since the letters both represent the potentiality of things and the materiality of existence. Each letter has an effect on three levels: space, time and the microcosm. The human body, like everything else, is composed basically of letters.

5 German pietism

Although Jewish mystical thought has a long history, it received a fresh impulse from the thinkers in the Rhineland in the twelfth and thirteenth centuries. Judah ben Samuel ben Kalonymus of Regensburg (d.1217) and his pupil Eleazar ben Judah ben Kalonymus of Worms (d.1240) combined the Kabbalah with the contributions of philosophers such as Al-Fayyumi Saadiah Gaon and Abraham Ibn Ezra to concentrate on the nature of divine glory. This concept was felt to be problematic, in that prayer implies that God has characteristics which Judaism in other places denies, and yet for prayer to be possible (it often seemed) there should be some scope for visualization of the object of prayer. Rhineland mystics distinguished between a lower and a higher glory, the latter being the *shekhinah* (presence or indwelling) while the former is to be identified with the prophetic or mystical imagination. The lower glory varies in its images, depending on the will of God and the capacities of the individual worshipper. There is certainly likely to be a heavy use of anthropomorphic imagery, in particular the notion of enthronement, with the proviso that the one who sits on the throne should not be regarded as a body. This point is emphasized by the tendency to apply the measurements which previously had been applied to God to the form which is constituted within the imagination, the lesser glory. How is the mystical experience to be achieved? Of great importance here is contemplation of the divine name, which progresses via a series of rituals of purification, and the recitation of the divine and angelic names and combinations of letters in order to bring about a state of religious ecstasy similar to prophecy.

6 Kabbalah in Spain and Provence

Kabbalistic thought developed at much the same time in Provence and Spain, although the lines of transmission are not clear. The main text here is the *Sefer ha-Bahir (Book of Bahir)*, which interprets biblical and rabbinic language into images of divine activity. The Sefirot in this work are seen as either like a tree or a human figure. We again need to return to Genesis 1: 26 and the idea of humanity being created in God's image, and this produces the notion of the divine body as paralleling the human frame - often characterized as Adam Kadmon, the primordial man. Through obeying the religious law, the individual strengthens the divine limb, while disobeying the law weakens it. Some Kabbalists see the Torah itself as the shape of God, so that each of the laws corresponds to, or is derived from, a particular limb in the perfect form of man, the form of Adam. On the other hand, they frequently warned against taking this imagery too literally, insisting that language about divine limbs was really about the divine powers, the Sefirot. Such language is entirely symbolic, and we cannot know the nature of divine reality. On the other hand, it must be admitted that much Kabbalistic writing is intensely anthropomorphic, and some Kabbalists were not frightened by the prospect of the interpretation of their language as more than exercises of imagination.

7 Light and darkness

The Sefirot are frequently identified with light, and are seen as the ten spiritual lights which emanate from the Eyn Sof, the Infinite. Although the Sefirot are many, they all originate in the One and indeed constitute a unity, expressed in an image popular in a variety of mystical philosophies. Light comes from one thing, and enables many things to be noticed, yet it is essentially just one thing. Neoplatonic language dominates here, and the emanation of the Sefirot from the Infinite One resembles the rays of light from the sun (see Neoplatonism). Like such rays, their production does not in any way diminish the power or the unity of the source. This sort of language led to an interesting debate between Kabbalists as to whether the Sefirot represent the essence of the deity or rather are the instruments into which God pours his ineffable light.

Questions about the nature of the opposite of light, namely, darkness, naturally arose within the Kabbalah. The *Zohar: Mishnat ha-Zohar (The Book of Splendour)* is the work that has the most detailed account of the struggle between the holy and the unholy. Sometimes this is represented as a battle between the forces of light and the forces of darkness, and sometimes both good and evil are seen as existing along a continuum of reality. On the latter view it is probably a mistake to see evil as a force which is in principle eradicable from the world, since it is a formal feature of reality and the best that can be achieved is to contain it.

The notion of light served as more than just a metaphysical notion; it is also a guide to the view of the Kabbalists as to how to achieve enlightenment. The divine form can be visualized through study of the Torah, and the esoteric approach to the latter as containing secrets means that these need to be elucidated, lit up as it were, so as to reveal what they hide. It was not regarded as coincidental that the Hebrew for ‘secret’ (*raz*) and ‘light’ (*or*) have the same numerical value. The letters of the Torah are literally luminous to those who know how to read them. The techniques of the Kabbalists often involved imagining colours while praying or meditating upon particular passages of the Bible, and the role of light is clearly of the first importance here.

8 Abraham Abulafia and prophetic Kabbalah

Abraham Abulafia (*c*.1240-*c*.1291) produced a different account of Kabbalah, which sees as the purpose of mysticism union with the deity. Abulafia criticizes the Kabbalists who see the Sefirot as divine powers, since such a view seemed to limit our access to the divine. If the Sefirot are seen as Neoplatonic separate intellects then we can, through perfecting ourselves, make contact with them, and thus become one with the emanation of reality and truth that flows from God. The route to this end is, among other activities, contemplation of the divine name. This sort of approach is called prophetic because it uses the language of prophecy made popular by the writings of Moses Maimonides and heavily relied upon in Islamic philosophy. For the authors who relied on these Neoplatonic themes, the overflow from the ‘active intellect’ leads to prophecy, and the prophet as a result comes into contact with the active intellect, the lowest of the ten separate intellects below God. It is when the prophet transcends his materiality and fulfills his spirituality that he may be able to rise to the level of the active intellect. Unlike the Islamic philosophers and Maimonides, who set forth an intellectual path for those who would attain prophecy, Abulafia recommended concentration on the permutations of the names of God and the letters constituting those names. The prophet has succeeded when he is able to see both the letters of the divine name and the being of God simultaneously.

Prophetic Kabbalah exercised much influence from the end of the thirteenth century in Palestine. Kabbalists in both Safed and Jerusalem derive much of their doctrine from Abulafia. They range from Isaac of Acre to Solomon Alkabetz, Moses Cordovero, Elijah de Vidas and Chayyim Vital, and even extend up to the eighteenth century and the works of the Hasidim (see Hasidism).

9 Jewish mysticism and Sufism

There can be little doubt that Sufism had a powerful impact on Jewish mysticism and Kabbalah (see Mystical philosophy in Islam). In the Iberian peninsula there were often close intercultural exchanges between Jews and Muslims, and both Ibn Masarra (886-931) and his disciple Sahl al-Tustari placed great importance on the mystical significance of the Arabic alphabet. As we have seen, there was a long-standing interest among Jewish thinkers in the arithmetical properties of Hebrew letters, and while this certainly predated Islam itself in the Talmud, it could well have been encouraged when Jewish philosophers became involved with Islamic Neoplatonism (see Neoplatonism in Islamic philosophy). Bahya ibn Paqudah’s *Fara’id al-qulub (Duties of the Hearts)* contains an individualistic description of a spiritual journey, leading the soul through contemplation and love to union with the

divine light, very much following the progressive spiritual stages of the path as described in Sufi pietistic books (see Ibn Paquda, Bahya). Bahya replaces Qur'anic motifs with Jewish ones and does not advocate extreme asceticism, as do some of the Sufis, yet the Sufi influences on his work are quite clear.

Sufism became important as a part of Islamic religious life in Egypt, which country was a haven for many Jews fleeing the Almohad persecution in the West and the Crusaders in the East. There are many Sufi works in the Cairo Genizah, the room in an old synagogue which contained thousands of writings going back to the Middle Ages. They were not destroyed, since it is forbidden to destroy anything on which the divine name may be written. There are many manuscripts of Muslim Sufi writings either in Arabic characters or in Hebrew (obviously translated for Jewish readers), or Sufi-inspired works written by Jews. The latter often include works on traditional Jewish themes, describing biblical figures as masters of the Sufi way. The most famous Jewish mystic in Egypt was undoubtedly the son of Moses Maimonides, Abraham (1186-1237) who is quite explicit in his use of Sufi material and authors in his *Kifayat al-'Abidin (Complete Guide for Devotees)* (see Maimonides, A.). Abraham stressed the spiritual significance of the Torah and the mysteries it contains, claiming that the Sufis had managed to hold on to these mysteries which then needed to be rediscovered by the Jews, who had lost them during the tragedy of the exile. Abraham seems to have initiated ceremonial practices in synagogues which were closely linked with Muslim practices in the mosque. He also advocated solitary meditation in a dark and isolated place, and reliance on the guidance of a spiritual master. Abraham's son, Obadyah, even went so far as to write rather disparagingly of marriage and family responsibilities, which is to go very far from the mainstream Jewish view of social responsibilities and the importance of family life.

The Kabbalist communities in Palestine were also close in their practices to Sufism, which was no doubt present in the wider community of the area. They advocated meditation and breath control in quiet dark places in order to attain illumination of the soul. The system of techniques used during these retreats included ritual purity, silence, fasting, restrictions of sleep and food, deep trust in God and the constant repetition of the divine name as aspects of the path to ecstasy and personal fulfilment. Sufism may even have influenced the types of mysticism followed in the Hasidism of the eighteenth century, which, it must be remembered, first developed in what had been a Turkish province of Poland. Shabbetai Zvi (d.1675) came into close contact with the Sufis even before his conversion to Islam, and his followers in the Ottoman empire continued to follow a form of worship which incorporated many Sufi practices. The close contact between Islamic and Jewish culture, which existed over a long and especially rich period, undoubtedly played its part in defining the specific character of Jewish mysticism.

Kaibara Ekken (1630-1714)

*Kaibara Ekken was a leading Japanese scholar in the school of neo-Confucianism established by the renowned twelfth century Chinese synthesizer, Zhu Xi. As a thinker and a scholar Ekken, embraced a wide variety of topics from highly specialized neo-Confucian philosophy to the need to popularize Confucian ethics and to assist the society through practical learning (*jitsugaku*).*

Born in Fukuoka in southern Japan, Ekken studied for seven years in Kyoto with the principal scholars of the period. He spent much of his life as an advisor and teacher to the Kuroda *daimyō* family in Fukuoka, but traveled frequently to Kyoto and the capital, Edo (Tokyo). Although Ekken did not establish his own school as did other neo-Confucian scholars, he became through his writings one of the most influential figures in early modern Japan. He lived during a period when Japan isolated itself from the rest of the world while developing a rich complex of Confucian, neo-Confucian, Shintōand Buddhist schools of thought. Neo-Confucianism in particular made a significant contribution to education during this period with the spread of schools and a curriculum largely based on Confucian and neo-Confucian texts and commentaries (see Confucian philosophy, Japanese; Neo-Confucian philosophy). It was in this context that Ekken's ideas had a particular impact in both their breadth and depth of concerns.

Ekken was especially concerned to spread neo-Confucian moral teachings and self-cultivation to society at large, and he encouraged the education of all classes. He felt that neo-Confucian ideas could contribute to harmony of both self and society. To accomplish this, he wrote numerous popular treatises on learning for women, for children and for the family. Many of these treatises were reprinted frequently throughout the Tokugawa period (1603-1868). He also wrote on such practical subjects as healthcare, botany, agriculture, topography and history. His work on healthcare is still consulted, and his botanical studies and classification earned him the title of 'the Aristotle of Japan'.

These broad interests in both education and practical learning were based on a carefully developed philosophical position. By the age of thirty he had rejected Buddhism as tending toward quietism, and Wang Yangming's neo-Confucianism as potentially antinomian (see Wang Yangming). He argued for the importance of Zhu Xi's neo-Confucianism (see Zhu Xi) but with some significant adaptations. Philosophically, Ekken embraced the unity of principle (*li*) and material force (*qi*) (see Li; Qi). His position, which was indebted to the Chinese neo-Confucian Luo Qinshun, is described as a monism of *qi*. In a significant treatise, the *Taigiroku (Record of Grave Doubts)*, Ekken demonstrated strong support for Zhu Xi while taking issue with Zhu Xi's apparent dualism of principle and material force.

Ekken's position came to advocate a dynamic naturalism that was both the basis of his studies of nature and medicine as well as of moral self-cultivation. His monism of *qi* in his philosophical writings was paralleled by a position of filiality in his popular treatises. Ekken suggested that just as reverence and respect are due to parents for their care and support, so also because humans are 'children of heaven and earth' they should encourage a filial response to heaven's mandate and care for nature's abundance.

Kant, Immanuel (1724-1804)

Immanuel Kant was the paradigmatic philosopher of the European Enlightenment. He eradicated the last traces of the medieval worldview from modern philosophy, joined the key ideas of earlier rationalism and empiricism into a powerful model of the subjective origins of the fundamental principles of both science and morality, and laid the ground for much in the philosophy of the nineteenth and twentieth centuries. Above all, Kant was the philosopher of human autonomy, the view that by the use of our own reason in its broadest sense human beings can discover and live up to the basic principles of knowledge and action without outside assistance, above all without divine support or intervention.

Kant laid the foundations of his theory of knowledge in his monumental Critique of Pure Reason (1781). He described the fundamental principle of morality in the Groundwork of the Metaphysics of Morals (1785) and the Critique of Practical Reason (1788), in the conclusion of which he famously wrote:

> *Two things fill the mind with ever new and increasing admiration and awe, the more often and steadily reflection is occupied with them:* the starry heaven above me and the moral law within me. *Neither of them need I seek and merely suspect as if shrouded in obscurity or rapture beyond my own horizon; I see them before me and connect them immediately with my existence.*
>
> *(5: 161-2; see List of works for method of citation)*

Kant tried to show that both the laws of nature and the laws of morality are grounded in human reason itself. By these two forms of law, however, he is often thought to have defined two incommensurable realms, nature and freedom, the realm of what is and that of what ought to be, the former of which must be limited to leave adequate room for the latter. Kant certainly did devote much space and effort to distinguishing between nature and freedom. But as he also says, in the Critique of Judgment (1790), it is equally important 'to throw a bridge from one territory to the other'. Ultimately, Kant held that both the laws of nature and the laws of free human conduct must be compatible because they are both products of human thought imposed by us on the data of our experience by the exercise of our own powers. This was clearly stated in his last book, The Conflict of the Faculties (1798):

> *Philosophy is not some sort of science of representations, concepts, and ideas, or a science of all sciences, or anything else of this sort; rather, it is a science of the human being, of its representing, thinking, and acting - it should present the human being in all of its components, as it is and ought to be, that is, in accordance with its natural determinations as well as its relationship of morality and freedom. Ancient philosophy adopted an entirely inappropriate standpoint towards the human being in the world, for it made it into a machine in it, which as such had to be entirely dependent on the world or on external things and circumstances; it thus made the human being into an all but merely passive part of the world. Now the critique of reason has appeared and determined the human being to a thoroughly* active *place in the world. The human being itself is the original creator of all its representations and concepts and ought to be the sole author of all its actions.*
>
> *(7: 69-70)*

Thus, Kant derived the fundamental principles of human thought and action from human sensibility, understanding, and reason, all as sources of our autonomy; he balanced the contributions of these principles against the ineliminable inputs of external sensation and internal inclination beyond our own control; and he strove both to demarcate these principles from each other and yet to integrate them into a single system with human autonomy as both its foundation and its ultimate value and goal. These were the tasks of Kant's three great critiques. In the Critique of Pure Reason, the essential forms of space, time and conceptual thought arise in the nature of human sensibility and understanding and ground the indispensable principles of human experience. He then argued that reason, in the narrow sense manifest in logical inference, plays a key role in systematizing human experience, but that it is a mistake to think that reason offers metaphysical insight into the existence and nature of the human soul, an independent world, and God. In the Critique of Practical Reason and Groundwork, however, he argued that reason as the source of the ideal of systematicity is the source of the fundamental law of morality and our consciousness of our own freedom, which is the source of all value, and that we can postulate the truth of the fundamental dogmas of Christianity, our own immortality and the existence of God, as practical presuppositions of our moral conduct but not as theoretical truths of metaphysics. In the Critique of Judgment,

Kant argued that the unanimity of taste and the systematic organization of both individual organisms and nature as a whole could be postulated, again not as metaphysical dogmas but rather as regulative ideals of our aesthetic and scientific pursuits; he then went on to argue that it is through these ideals that we can tie together the realms of nature and freedom, because aesthetic experience offers us a palpable image of our moral freedom, and a scientific conception of the world as a system of interrelated beings makes sense only as an image of the world as the sphere of our own moral efforts. In many of his last writings, from Religion within the Limits of Reason Alone (1793) to his final manuscripts, the Opus postumum, Kant refined and radicalized his view that our religious conceptions can be understood only as analogies for the nature of human reason itself.

The Enlightenment began by attempting to bring even God before the bench of human reason - at the turn of the eighteenth century, both Shaftesbury in Great Britain and Wolff in Germany rejected voluntarism, the theory that God makes eternal truths and moral laws by fiat, and argued instead that we ourselves must know what is right and wrong before we could even recognize supposedly divine commands as divine. Kant completed their argument, concluding that the human being 'creates the elements of knowledge of the world himself, a priori, from which he, as, at the same time, an inhabitant of the world, constructs a world-vision in the idea' (Opus postumum, 21: 31).

1 Life and works

Immanuel Kant was born on 22 April 1724 in Königsberg, the capital of East Prussia. He was the child of poor but devout followers of Pietism, a Lutheran revival movement stressing love and good works, simplicity of worship, and individual access to God. Kant's promise was recognized by the Pietist minister Franz Albert Schultz, and he received a free education at the Pietist gymnasium. At sixteen, Kant entered the University of Königsberg, where he studied mathematics, physics, philosophy, theology, and classical Latin literature. His leading teacher was Martin Knutzen (1713-51), who introduced him to both Wolffian philosophy and Newtonian physics, and who inspired some of Kant's own later views and philosophical independence by his advocacy of physical influx against the pre-established harmony of Leibniz and Wolff. Kant left university in 1746, just as the major works of the anti-Wolffian Pietist philosopher Christian August Crusius were appearing. Kant's upbringing would have made him receptive to Crusius, and thus he left university imbued with the Enlightenment aims of Wolffian philosophy but already familiar with technical criticisms of it, especially with Crusius's critique of Wolff's attempt to derive substantive conclusions from a single and merely formal first principle such as the logical principle of non-contradiction (see Wolff, C.).

On leaving university, Kant completed his first work, *Thoughts on the True Estimation of Living Forces* (1746, published 1749), an unsuccessful attempt to mediate between Cartesian and Leibnizian theories of physical forces. Kant then worked as a tutor, serving in households near Königsberg for the next eight years. When he returned to the university in 1755, however, he had several works ready for publication. The first of these was *Universal Natural History and Theory of the Heavens*, a much more successful scientific work than his first in which Kant argued for the nebular hypothesis, or origin of the solar system out of a nebular mass by purely mechanical means. The book was scarcely known during Kant's lifetime, however, so the French astronomer Pierre Laplace (1749-1827) developed his version of the nebular hypothesis (published 1796) independently, and the theory became known as the Kant-Laplace hypothesis only later. In 1755, Kant also published two Latin works, his MA thesis *A brief presentation of some thoughts concerning fire*, and his first philosophical work, *A new elucidation of the first principles of metaphysical cognition*, which earned him the right to offer lectures at the university as a *Privatdozent* paid directly by his students. The following year Kant published *The employment in natural philosophy of metaphysics combined with geometry, of which sample I contains the physical monadology*, which made him eligible for a salaried professorship, although he was not to receive one until 1770. In these years, Kant also published four essays on earthquakes and winds.

Kant began lecturing in the autumn of 1755, and to earn a living lectured more than twenty hours a week. His topics included logic, metaphysics, ethics, and physics, and he subsequently added physical geography, anthropology (Germany's first lectures so entitled), pedagogy, natural right and even the theory of fortifications. Except for one small essay on optimism (1759), he did not publish again until 1762, when another burst of publications began. He then published, all in German: *The False Subtlety of the Four Syllogistic Figures* (1762); *The Only Possible Argument in support of a Demonstration of the Existence of God* and *Attempt to Introduce the*

Concept of Negative Magnitudes into Philosophy (1763); *Observations on the Beautiful and Sublime* and *Inquiry concerning the Distinctness of the Principles of Natural Theology and Morality* (1764), the latter of which was his second-place entry in a competition won by Moses Mendelssohn; *Dreams of a Spirit-Seer, elucidated by Dreams of Metaphysics* (1766); and *Concerning the Ultimate Ground of the Differentiation of Directions in Space* (1768). These publications earned Kant widespread recognition in Germany. During this period, Kant was deeply struck by the work of Jean-Jacques Rousseau, especially by his *Social Contract* and the paean to freedom in *Émile* (both 1762). By this time Kant was also acquainted with the philosophy of David Hume, whose two *Enquiries* and other essays, but not *A Treatise of Human Nature*, were published in German as early as 1755.

Having unsuccessfully applied for several chairs at home while declining offers elsewhere, Kant was finally appointed Professor of Logic and Metaphysics in Königsberg in 1770. This event occasioned his inaugural dissertation, and last Latin work, *On the form and principles of the sensible and intelligible world*. Following correspondence about this work with Johann Heinrich Lambert, Johann Georg Sulzer, and Mendelssohn, however, Kant fell into another decade-long silence, broken only by a few progress reports to his recent student Marcus Herz and a few minor essays. Yet during this ‘silent decade’, Kant was preparing for his enormous body of subsequent works. Beginning in 1781, with the first edition of the *Critique of Pure Reason*, Kant unleashed a steady torrent of books. These include: *Prolegomena to Any Future Metaphysics that shall come forth as Scientific*, an attempted popularization of the first *Critique*, in 1783; two essays, ‘Idea for a Universal History from a Cosmopolitan Point of View’ and ‘What is Enlightenment?’ in 1784; *The Groundwork of the Metaphysics of Morals* and four other essays in 1785; *The Metaphysical Foundations of Natural Science*, essays on ‘The Conjectural Beginnings of Human History’ and ‘What Does it mean to Orient Oneself in Thinking?’ and two other pieces in 1786; a substantially revised second edition of the *Critique of Pure Reason* in 1787; in 1788, the *Critique of Practical Reason* and an essay on ‘The Use of Teleological Principles in Philosophy’; the *Critique of Judgment* as well as an important polemic ‘On a discovery according to which any new Critique of Pure Reason is rendered dispensable by an older one’ in 1790; the political essay ‘On the Common Saying: "That may be right in theory but does not work in practice"’ and the controversial *Religion within the Limits of Reason Alone* in 1793; *Towards Perpetual Peace* in 1795; the *Metaphysics of Morals*, comprising the ’Doctrine of Right’ and the ’Doctrine of Virtue’, in 1797, as well as the essay ‘On a putative Right to Lie from Love of Mankind’; and his last major works in 1798, a handbook on *Anthropology from a Pragmatic Point of View* and his defence of the intellectual freedom of the philosophical faculty from religious and legal censorship in the restrictive atmosphere of Prussia after Frederick the Great, *The Conflict of the Faculties*. (With Kant’s approval, some of his other lecture courses were also published, including *Logic* in 1800 and *Physical Geography* and *Pedagogy* in 1804.) Kant retired from lecturing in 1797, at the age of seventy-three, and devoted his remaining years to a work which was to be entitled ‘The Transition from the Metaphysical First Principles of Natural Science to Physics’, but which was far from complete when Kant ceased working on it in 1803. (Selections from his drafts were first published in 1882-4, and they were first fully published as *Opus postumum* in 1936-8). After a lifetime of hypochondria without any serious illness, Kant gradually lost his eyesight and strength and died 12 February 1804.

2 Kant’s work to 1770

In his first work, *Living Forces*, Kant tried to mediate a dispute about the measurement of forces between Descartes and Leibniz by employing a distinction between ’living’ or intrinsic forces and ’dead’ or impressed ones to argue that Leibniz’s measure was correct for the former and Descartes’s for the latter. This distinction could not be maintained in a uniform mechanics, and the young Kant remained ignorant of the mathematically correct solution, which had been published by D’Alembert in 1743. Nevertheless, the work already showed Kant’s lifelong preoccupation with the relation between scientific laws and metaphysical foundations. It also included the observation that the three-dimensionality of physical space is a product of actually existing forces, not the only geometry that is logically possible (10, 1: 24).

Kant’s works of 1755 reveal more of his originality and his enduring themes. *Universal Natural History*, deriving the present state of the planets from postulated initial conditions by reiterated applications of the laws of Newtonian mechanics, manifests not only Kant’s commitment to those laws, for which he was subsequently to seek philosophical foundations, but also his commitment to thoroughly naturalistic explanations in science, in which God can be the initial source of natural laws but never intervenes within the sequence of physical causes. *New Elucidation*, while not yet a methodological break from the rationalism of Leibniz, Wolff and Alexander

Gottlieb Baumgarten (1714-62) (whose textbooks on metaphysics, ethics and aesthetics Kant used for decades), breaks with them on several substantive issues. Kant begins by rejecting Wolff's supposition that the principle of non-contradiction is a single yet sufficient principle of truth, arguing instead that there must be separate first principles of positive and negative truths; following Crusius, Kant was always to remain suspicious of programmes to reduce all truth to a single principle. Kant then criticized previous proofs of the Principle of Sufficient Reason, although his own proof was also a failure. More importantly, he argued that the principle of sufficient reason does not entail the theory of pre-established harmony drawn from it by the Leibnizians: the need for a sufficient reason for any change in a substance proves the necessity rather than impossibility of real interaction among a plurality of substances. Transposed into an epistemological key, this argument was to become central in the first *Critique*. The work is also noteworthy for the first suggestion of Kant's critique of Descartes's ontological argument for the existence of God (see God, arguments for the existence of), and for a first treatment of the problem of free will as well. Here Kant defended against the indeterminism of Crusius the determinism of Leibniz (see Determinism and indeterminism), although he was later to criticize this as the 'freedom of a turnspit' (5: 97). Kant's later theory of free will, however, attempts to reconcile Crusius and Leibniz.

In the *Physical Monadology* (1756), Kant tries to reconcile the infinite divisibility of space in geometry with the need for simple, indivisible substances in metaphysics - the subsequent theme of the first *Critique*'s second Antinomy (see §8). Kant does not yet appeal to a metaphysical distinction between appearance and reality, but instead argues that because bodies in space are not ultimately composed of particles but of attractive and repulsive forces (1: 484), they may be physically indivisible even when space itself is still mathematically divisible.

Kant's works of the 1760s introduce some of the methodological as well as substantive assumptions of his mature philosophy. *The Only Possible Argument* details Kant's attack upon the ontological argument, the paradigmatic rationalistic argument because of its presupposition that an existence-statement can be derived from the analysis of a concept. Kant argues that 'existence is not a predicate or a determination of a thing' (2: 72), but rather the 'absolute positing of a thing' (2: 73); that is, the existence of its subject is *presupposed* by the assertion of any proposition, not inferred from the concepts employed in it. Kant also maintains that the other rationalist argument for theism, the argument from the contingency of the world to a necessary cause of it, as well as the empiricists' favourite, the argument from design, fail to prove the existence of a necessary being with all the attributes of God. However, Kant still holds that the existence of God can be proved as a condition of the *possibility* of any reality. Finally, Kant further develops his argument that scientific explanation cannot allow divine intervention in the sequence of events, and that God must only be seen as the original ground of the laws of nature.

Negative Magnitudes announces a fundamental methodological break from rationalism. Inspired by both Crusius and Hume, Kant argues that *real opposition* (as when two velocities in opposite directions or a pleasure and a pain cancel each other out) is fundamentally different from *logical contradiction* (as between a proposition and its negation); he then applies this to causation, arguing that the *real ground* of a state does not entail its existence logically, but is connected to it in an entirely different way. This precludes any proof of the principle of sufficient reason from merely logical considerations alone (2: 202).

The *Inquiry into the Distinctness of the Principles of Natural Theology and Ethics* continues Kant's attack upon rationalism. The question for this essay was whether metaphysics could use the same method as mathematics, which Kant firmly denied: mathematics, he argues, can prove its theorems by constructing its objects from their very definitions, but metaphysics can only use analysis to tease out the definitions of its objects from given concepts, and cannot construct the objects themselves (2: 276). The claim that the method of philosophy is analysis may sound like rationalism; however, Kant insists that in both metaphysics and ethics philosophy needs *material* as well as *formal* first principles, again precluding any purely logical derivation of philosophical theses. Kant does not yet have a clear account of material first principles - he is sympathetic to Crusius's account of indemonstrable cognitions and to the suggestion of the moral sense theorists Shaftesbury and Hutcheson that the first principles of ethics arise from *feeling*, but not satisfied with either. Without yet naming it, Kant also introduces his distinction between hypothetical and categorical imperatives (2: 298).

Still in 1764, however, the book *Observations on the Beautiful and Sublime* already announces Kant's departure from moral sense theory and introduces the most fundamental theme of Kant's ethics. Virtue cannot depend merely

on benevolent inclination, but only on general principles, which in turn express ‘a feeling that lives in every human breast and extends itself much further than over the particular grounds of compassion and complaisance…the *feeling of the beauty and dignity of human nature*’ (2: 217). In notes in his own copy of this work, Kant went even further, and first clearly stated his enduring belief that ‘freedom properly understood (moral, not metaphysical) is the supreme principle of all virtue as well as of all happiness’ (20: 31).

In *Dreams of a Spirit-Seer*, Kant ridicules traditional metaphysics by comparing it to the fantasies of the Swedish theosophist Emmanuel Swedenborg; Kant argues instead that metaphysical concepts cannot be used without empirical verification, and that therefore metaphysics can at most be ‘a science of the *boundaries of human reason*’ (2: 368). The work also contains further thoughts on morality, suggesting that the two forces of egoism and altruism define the structure of the moral world in much the way that the forces of repulsion and attraction define that of the physical world (2: 334). But Kant does not yet argue that postulates of practical reason may be a valid alternative to the delusions of metaphysics.

Finally, the brief essay on *Directions in Space* argues that incongruent counterparts, such as right- and left-handed gloves, which have identical descriptions but cannot occupy the same space, prove that the qualities of objects are not determined by concepts alone but also by their relation to absolute space. Kant did not yet raise metaphysical questions about the nature of absolute space or epistemological questions about how we could know it, but this essay can be seen as introducing the distinction between intuitions and concepts which was to be a cornerstone of Kant’s subsequent thought (see §5).

3 The *Inaugural Dissertation* of 1770 and the problem of metaphysics

Kant’s *Inaugural Dissertation* of 1770 consolidated many of the gains he had made during the 1760s and introduced a fundamentally new theory about the metaphysics and epistemology of space and time which was to remain a constant in his subsequent thought, but also left open crucial questions about the source of our most fundamental concepts. Although Kant hoped to proceed quickly to his projects in the philosophy of science and in moral and political theory, it was to take him all of the next decade to answer these preliminary questions.

Taking up where *Directions in Space* left off, Kant begins the dissertation with the distinction between intuitions (singular and immediate representations of objects) and concepts (general and abstract representations of them) as distinct but equally important elements in the ‘*two-fold genesis* of the concept [of a world] out of the nature of the mind’. The intellect (Kant does not yet divide this into understanding and reason) provides abstract concepts, under which instances are subordinated; the ‘sensitive faculty of cognition’ provides ‘distinct intuition[s]’ which represent concepts ‘in the concrete’ and within which different parts may be coordinated (2: 387). Kant goes on to claim that ‘whatever in cognition is sensitive is dependent upon the special character of the subject’, that is, the knower, so that sensation, through intuitions, represents things ‘*as they appear*’ (*phenomena*), while the intellect, through concepts, represents things ‘*as they are*’ (*noumena*) (2: 392). Kant then presents the ‘principles of the form of the sensible world’: time and space are the forms of the intuition of all objects (time is the form for all representation of objects, inner or outer, while space is the form for the representation of all outer objects) which do not arise from but are presupposed by all particular perceptions; they are singular rather than general, that is, particular times or spaces are parts of a single whole rather than instances of a general kind; and they must each be ‘the subjective condition which is necessary, in virtue of the nature of the human mind, for the co-ordinating of all things in accordance with a fixed law’, or a ‘*pure intuition*’ rather than ‘*something objective and real*’ (2: 398-400, 402-4). Only thus can we explain our knowledge of both these general claims about space and time as well as particular claims about their structure, such as the theorems of geometry (2: 404). In other words, we can explain the certainty of knowledge about space and time only by supposing that it is knowledge of the structure of our own minds, and thus of how objects appear to us, rather than knowledge about how things are in themselves. This necessarily subjective origin and significance of certainty, which Kant was later to name ‘transcendental idealism’, is the foundation for the active role of the human mind in knowledge of the world.

Kant has little to say about the source of intellectual concepts, but continues to believe that they give us knowledge of how things are independently of the structure of our own minds. His main claim, still Leibnizian, is that in order to conceive of things as genuinely distinct substances, yet as collectively interacting in a single world, we must conceive of them as contingent beings all depending upon a single necessary being (2: 407-8). Kant then argues that metaphysical error arises when the principles of sensitive and intellectual cognition are confused, but more

particularly when 'the principles which are native to sensitive cognition transgress their limits, and affect what belongs to the intellect' (2: 411) - the opposite of what he will argue later when he claims that metaphysical illusion arises from thinking that human reason can reach beyond the limits of the senses (see §8). Finally, Kant introduces as mere 'principles of convenience' the principles of universal causation and of the conservation of substance as well as a more general 'canon' of rationality, that '*principles are not to be multiplied beyond what is absolutely necessary*' (30, 2: 418). A better account of these principles will occupy much of Kant's later work (see §7).

Early readers of Kant's dissertation objected to the merely subjective significance of space and especially time, but Kant was never to surrender this theory. What came to bother him instead was his inadequate treatment of metaphysical concepts such as 'possibility, existence, necessity, substance, cause, etc.' (2: 395). In a famous letter of 21 February 1772 to Marcus Herz (10: 129-35), Kant claimed that the 'whole secret' of metaphysics is to explain how intellectual concepts which neither literally produce their objects (as God's concepts might) nor are merely produced by them (as empirical concepts are) nevertheless necessarily apply to them. But Kant did not yet know how to answer this question.

His first progress on this issue is found in fragments from 1774-5 (Reflections 4674-84, 17: 643-73). Two key ideas are found here. First, Kant finally formulates the problem of metaphysics as that of 'synthetic' rather than 'analytic' propositions: how can we know the truth of propositions in which the predicates clearly go beyond anything contained in their subject-concepts but yet enjoy the same universality and necessity as propositions which are mere tautologies, whose predicates are contained in their subject concepts (17: 643-4, 653-5)? Second, Kant here first states that the answer to this question lies in recognizing that certain fundamental concepts, not just the intuitions of space and time, are 'conditions of the concrete representation [of objects] in the subject' (17: 644) or of the unity of '*experience* in general' (17: 658). Kant's idea is that in order to ground any determinate ordering of either subjective or objective states in temporal succession, we must use the concepts of substance, causation, and interaction, and that these must therefore be categories which originate in the understanding just as the pure forms of space and time originate in the sensibility.

4 The project of the *Critique of Pure Reason*

In spite of this progress in 1775, six more years passed before the *Critique of Pure Reason* finally appeared in 1781. In an umistakeable reference to Locke's *Essay concerning Human Understanding* (see Locke, J.), Kant began the work with the promise to submit reason to a critique in order to obtain a 'decision about the possibility or impossibility of metaphysics in general and the determination of its sources, its scope and its boundaries' (A xii). The 'chief question' would be 'what and how much can understanding and reason know apart from all *experience*?' (A xvii). Answering this question would require discovering the fundamental principles that human understanding contributes to human experience and exposing the metaphysical illusions that arise when human reason tries to extend those principles beyond the limits of human experience.

But Kant's project was even more ambitious than that, as he was to make clear in the revised edition of the *Critique* six years later. There, in addition to more explicitly describing his strategy for explaining the certainty of the first principles of human knowledge as one of supposing that 'objects must conform to our knowledge' rather than vice versa (B xvi), Kant described his whole project in broader terms: 'I therefore had to offset *knowledge* in order to make room for *belief*' (B xxx). Kant did not mean to return to the sceptical fideism of earlier thinkers such as Pierre Bayle, who simply substituted religious belief for theoretical ignorance. Instead, Kant argues first that the human mind supplies necessary principles of sensibility and understanding, or perception and conception; next, that if human reason tries to extend the fundamental concepts and principles of thought beyond the limits of perception for purposes of theoretical knowledge, it yields only illusion; but finally that there is another use of reason, a practical use in which it constructs universal laws and ideals of human conduct and postulates the fulfilment of the conditions necessary to make such conduct rational, including the freedom of the will, the existence of God, and the immortality of the soul. This use of reason does not challenge the limits of theoretical reason but is legitimate and necessary in its own right.

In the Introduction, Kant defines his first task as that of explaining the possibility of synthetic a priori judgments. This notion is grounded in two distinctions. First, there is a logical distinction between analytic and synthetic propositions: in analytic propositions, the predicate-concept is implicitly or explicitly contained in the

subject-concept (for example, ‘A bachelor is unmarried’ or ‘An unmarried male is male’), so the proposition conveys no new information and is true by identity alone; in synthetic propositions, the content of the predicate is clearly not contained in the subject-concept (for example, ‘Bachelors are unhappy’) (A 6-7/B 10-11), so the proposition conveys new information and cannot be true by identity alone. Second, there is an epistemological distinction between propositions which are a posteriori, or can be known to be true only on the basis of antecedent experience and observation, and those which are a priori, or known to be true independently of experience, or at least any particular experience (A 1-2/B 1-3). Kant maintains that anything which is known to be universally and necessarily true must be known a priori, because, following Hume, he assumes that experience only tells us how what has actually been observed is, not how everything must be (A 1-2/B 3-4). Combining these two distinctions yields four possible kinds of judgments. Two of these obviously obtain: analytic a priori judgments, in which we know a proposition to be true by analysis of its subject-concept and without observation; and synthetic a posteriori judgments, in which we know factual statements going beyond subject-concepts to be true through observation. Equally clearly, a third possibility is excluded: there are no analytic a posteriori judgments, for we need not go to experience to discover what we can know from analysis alone. What is controversial is whether there are synthetic a priori judgments, propositions that are universally and necessarily true, and thus must go beyond experience, but which cannot be reached by the mere analysis of concepts. Both rationalists and empiricists had denied such a possibility, but for Kant only it could ground an informative science of metaphysics at all.

Kant’s notion of synthetic a priori judgment raises various problems. Critics have long complained that Kant provides no unequivocal criterion for deciding when a predicate is contained in a subject, and twentieth-century philosophers such as W. Quine argued that there are no analytic truths because not even definitions can be held entirely immune from revision in the face of empirical facts. Lewis White Beck showed, however, that this did not affect Kant’s project, for Kant himself, in a polemic with the Wolffian Johann August Eberhard, argued that analysis always presupposes synthesis, and that the adoption of any definition itself has to be justified, either by construction or observation; so even conceding that all judgments are ultimately synthetic, Kant’s question remains whether any of these are synthetic a priori.

Another issue is just what synthetic a priori judgments Kant intended to justify. In the ’Prolegomena’ and the ’Introduction’ to the second edition of the *Critique*, Kant suggests that it is obvious that synthetic a priori judgments exist in what he calls ’pure mathematics’ and ’pure physics’, and that his project is to show that what explains these also explains other such propositions, in metaphysics. Elsewhere, however, Kant suggests that metaphysics must show that there are any synthetic a priori judgments, even in mathematics and physics. While much of the content of the *Critique* suggests that Kant’s considered view must be the latter, he is far from clear about this.

5 Space, time and transcendental idealism

The first part of the *Critique*, the ‘Transcendental Aesthetic’, has two objectives: to show that we have synthetic a priori knowledge of the spatial and temporal forms of outer and inner experience, grounded in our own pure intuitions of space and time; and to argue that transcendental idealism, the theory that spatiality and temporality are only forms in which objects appear to us and not properties of objects as they are in themselves, is the necessary condition for this a priori knowledge of space and time (see Space; Time).

Much of the section refines arguments from the inaugural dissertation of 1770. First, in what the second edition labels the ‘Metaphysical Exposition’, Kant argues that space and time are both *pure forms of intuition* and *pure intuitions*. They are pure *forms* of intuition because they must precede and structure all experience of individual outer objects and inner states; Kant tries to prove this by arguing that our conceptions of space and time cannot be derived from experience of objects, because any such experience presupposes the individuation of objects in space and/or time, and that although we can represent space or time as devoid of objects, we cannot represent any objects without representing space and/or time (A 23-4/B 38-9; A 30-1/B 46). They are pure *intuitions* because they represent single individuals rather than classes of things; Kant tries to prove this by arguing that particular spaces and times are always represented by introducing boundaries into a single, unlimited space or time, rather than the latter being composed out of the former as parts, and that space and time do not have an indefinite number of instances, like general concepts, but an infinite number of parts (A 24/B 39-40; A 31-2/B 47-8).

Next, in the ‘Transcendental Exposition’, Kant argues that we must have an a priori intuition of space because

'geometry is a science which determines the properties of space synthetically and yet a priori' (B 40). That is, the propositions of geometry describe objects in space, go beyond the mere concepts of any of the objects involved - thus geometric theorems cannot be proved without actually constructing the figures - and yet are known a priori. (Kant offers an analogous but less plausible argument about time, where the propositions he adduces seem analytic (B 48).) Both our a priori knowledge about space and time in general and our synthetic a priori knowledge of geometrical propositions in particular can be explained only by supposing that space and time are of subjective origin, and thus knowable independently of the experience of particular objects.

Finally, Kant holds that these results prove transcendental idealism, or that space and time represent properties of things as they appear to us but not properties or relations of things as they are in themselves, let alone real entities like Newtonian absolute space; thus his position of 1768 is now revised to mean that space is epistemologically but not ontologically absolute (A 26/B 42; A 32-3/B 49-50; A 39-40/B 56-7). Kant's argument is that 'determinations' which belong to things independently of us 'cannot be intuited prior to the things to which they belong', and so could not be intuited a priori, while space and time and their properties *are* intuited a priori. Since they therefore cannot be properties of things in themselves, there is no alternative but that space and time are merely the forms in which objects appear to us.

Much in Kant's theory has been questioned by later philosophy of mathematics. Kant's claim that geometrical theorems are synthetic because they can only be proven by construction has been rendered doubtful by more complete axiomatizations of mathematics than Kant knew, and his claim that such propositions describe objects in physical space yet are known a priori has been questioned on the basis of the distinction between purely formal systems and their physical realization.

Philosophical debate, however, has centred on Kant's inference of transcendental idealism from his philosophy of mathematics. One issue is the very meaning of Kant's distinction between appearances and things in themselves. Gerold Prauss and Henry Allison have ascribed to Kant a distinction between two kinds of *concepts* of objects, one including reference to the necessary conditions for the perception of those objects and the other merely leaving them out, with no ontological consequences. Another view holds that Kant denies that things in themselves, and not merely their concepts, are spatial and temporal, and that spatial and temporal properties are, literally, properties only of our own representations of things. Kant makes statements that can support each of these interpretations; but proponents of the second view, including the present author, have argued that it is entailed by both Kant's argument for and his use of his distinction, the latter especially in his theory of free will (see §8).

The debate about Kant's argument for transcendental idealism, already begun in the nineteenth century, concerns whether Kant has omitted a 'neglected alternative' in assuming that space and time must be *either* properties of things as they are in themselves or of representations, but not both, namely that we might have a priori knowledge of space and time because we have an a priori subjective representation of them while they are also objective properties of things. Some argue that there is no neglected alternative, because although the *concepts* of appearances and things in themselves are necessarily different, Kant postulates only one set of *objects*. This author has argued that the 'neglected alternative' is a genuine possibility that Kant intends to exclude by arguing from his premise that propositions about space and time are *necessarily* true: if those propositions were true *both* of our own representations and of their ontologically distinct objects, they might be necessarily true of the former but only contingently true of the latter, and thus not necessarily true throughout their domain (A 47-8/B 65-6). In this case, however, Kant's transcendental idealism depends upon a dubious claim about necessary truth.

6 Pure concepts of the understanding

The 'Transcendental Analytic' of the *Critique* breaks new ground, arguing that the most fundamental categories of thought as well as the forms of perception are themselves human products which are necessary conditions of the possibility of experience. Like the 'Transcendental Aesthetic', its first section, the 'Analytic of Concepts', is also divided into a 'metaphysical' and a 'transcendental deduction' (B 159).

In the metaphysical deduction Kant intends to provide a principle to identify the most fundamental concepts of thought, the categories of the understanding, and then to show that our knowledge of any object always involves these categories. The key to his argument is the claim that knowledge is always expressed in a *judgment* (A 68-9/B 93-4); he then argues that there are certain characteristic forms or 'logical functions' of judgment, and that in order

for our judgments to be about objects, these logical functions of judgments must also provide the basic concepts for conceiving of objects. Thus Kant first produces a table of the logical functions of judgment, based on the premise that every judgment has a *quantity*, *quality*, *relation* and *modality*, and then produces a table of categories, under the same four headings, showing how objects of such judgments must be conceived. Thus, judgments may be universal, particular, or singular, and then their objects must be unities, pluralities, or totalities; judgments may be affirmative, negative, or infinite, and objects manifest either reality, negation, or limitation; judgments may relate a predicate to a subject (categorical judgment), or else relate one predicate-subject judgment to another as antecedent and consequent (hypothetical judgment) or as alternatives (disjunctive judgment), and objects may correspondingly manifest the relations of inherence and subsistence, causality and dependence, or community or reciprocity; finally, judgments may be problematic, assertoric, or apodeictic, thus their objects either possible or impossible, existent or non-existent, or necessary or contingent (A 70/B 95; A 80/B 106).

Kant's scheme is intuitively plausible, and he makes use of it throughout his works. But philosophers as diverse as Hegel and Quine have questioned its coherence and necessity. What is troubling for Kant's own project, however, is that he does not show why we must use all the logical functions of judgment, hence why we must use all the categories. In particular, he does not show why we must make not only categorical but also hypothetical and disjunctive judgments. Without such a premise, Kant's arguments for causation, against Hume, and for interaction, against Leibniz, are not advanced.

Kant's aim and his strategy in the transcendental deduction remain debatable, despite his complete revision of this section in the second edition of the *Critique*. Some view the transcendental deduction as a 'regressive argument' aimed at empiricism, meant to show only that *if* we make judgments about objects then we must use a priori concepts. But if Kant already established this in the metaphysical deduction, the transcendental deduction becomes redundant. It seems more natural to see the latter as intended to fix the *scope* of our use of the categories by showing that we can have *no* experience which is immune from conceptualization under them, thus that the categories enjoy universal objective validity. Because these categories originate in the logical structure of our own thought, Kant holds, we must conceive of ourselves as the autonomous lawgivers for all of nature (A 127-8, B 164).

There are many differences between the two versions of the transcendental deduction, but both employ the fundamental idea that we cannot have some form of *self*-consciousness, or 'transcendental apperception', without also having consciousness of *objects*, which in turn requires the application of the categories; then, since Kant holds that we can have no experience at all without being able to be conscious that we have it, he can argue that we can have no experience to which we cannot apply the categories. The success of this strategy is unclear. The first-edition deduction begins with a debatable analysis of the necessary conditions for knowledge of an object, which slides from the conditional necessity that we must use rules if we are to have knowledge of objects to an absolute necessity that we must have knowledge of objects, and then introduces transcendental apperception as the 'transcendental ground' of the latter necessity (A 106). In the second edition, Kant begins directly with the claim that self-consciousness of our experience is always possible, which has not met with much resistance, but then makes the inference to the necessity of knowledge of objects conceived of through the categories by equating transcendental apperception with a notion of 'objective apperception' that is equivalent to judgment about objects (B 139-40). This makes the connection between self-consciousness and the categorial judgment of objects true by definition, and undermines Kant's claim to provide a synthetic rather than analytic proof of the objective validity of the categories.

In spite of these problems, the idea that self-consciousness depends upon knowledge of objects and thus on the use of the categories to conceive of objects has remained attractive; and some of the most interesting recent work on Kant has been reconstructions of the transcendental deduction, such as those by Peter Strawson, Jonathan Bennett and Dieter Henrich. Others have concluded that Kant only establishes a convincing connection between self-consciousness and categorial thought of objects once he shows that making judgments about objects, using the categories, is a necessary condition for making judgments about the *temporal* order of our experience. This is Kant's project in the next section of the *Critique*.

7 The principles of judgment and the foundations of science

Kant proceeds from the categories to the foundations of natural science in several steps. First, he argues that the

categories, which thus far have merely logical content, must be made 'homogeneous' with experience, or be recast in forms we can actually experience. Since time, as the form of both outer and inner sense, is the most general feature of our sensible experience, Kant argues that the categories must be made homogeneous with experience by being associated with certain determinate temporal relations or 'schemata' (A 138-9/B 177-8). For example, the pure category of ground and consequence, thus far understood only abstractly as the relation of the states of objects that makes them fit to be objects of hypothetical ('if-then') judgments, is associated with the schema of rule-governed temporal succession, something closer to what we can actually experience. Focused as he is on the universality of time, Kant seems to de-emphasize spatiality unduly in the 'Schematism': for example, it would seem more natural to say that the schema of causality is the rule-governed temporal succession of states of objects within an appropriate degree of spatial contiguity.

Next, in the 'System of all Principles of Pure Understanding', Kant argues for the necessity of certain fundamental principles of all natural laws. Following the division of the categories, this chapter is divided into four parts. In the first, the 'Axioms of Intuition', Kant argues that 'All intuitions are extensive magnitudes' (B 202), and thus that all objects of experience are subject to the mathematics of discrete quantities. In the second, the 'Anticipations of Perception', Kant proves that 'In all appearances, the real that is an object of sensation has intensive magnitude, that is, a degree' (B 207), and is thus subject to the mathematics of continuous quantities; here he argues that because our sensations manifest varying degrees of intensity we must also conceive of the objects they represent as manifesting a reality that varies in degree. The first of these two 'mathematical' principles (A 162/B 201) does not add to results already established in the Transcendental Aesthetic, however, and the second depends upon an empirical assumption.

In the next section, the 'Analogies of Experience', dealing with the first of two kinds of 'dynamical' principles, Kant offers some of the most compelling and important arguments in the *Critique*. In the First Analogy, Kant argues that we can determine that there has been a change in the objects of our perception, not merely a change in our perceptions themselves, only by conceiving of what we perceive as successive states of enduring substances (see Substance). Because we can never perceive the origination or cessation of substances themselves, but only changes in their states, Kant argues, the sum-total of substances in nature is permanent (B 224). In the Second Analogy, Kant argues for a further condition for making judgments about change in objects: because even when we undergo a sequence of perceptions, there is nothing in their immediate sensory content to tell us that there is an objective change, let alone what particular sequence of change there is, we can only distinguish a '*subjective sequence* of apprehension from the *objective sequence* of appearances' (A 193/B 238) by judging that a particular sequence of objective states of affairs, *a fortiori* the sequence of our perceptions of those states, has been determined in accordance with a rule that states of the second type can only follow states of the first type - precisely what we mean by a causal law. Finally, the Third Analogy argues that because we always perceive states of objects successively, we cannot immediately perceive states of two or more objects to be simultaneous, and can therefore only judge that two such states simultaneously exist in different regions of space if they are governed by laws of interaction dictating that neither state can exist without the other (A 213/B 260).

Kant's arguments have been assailed on the basis of relativity theory and quantum mechanics. But since they are epistemological arguments that our ability to make temporal judgments about the succession or simultaneity of states of affairs depends upon our judgments about substance, causation and interaction, it is not clear that they are open to objection from this quarter. If relativity tells us that the succession or simultaneity of states of affairs may depend upon the choice of inertial frame, then Kant's theory is not refuted, but just predicts that in that case our own judgments about temporal sequence must also vary. If quantum mechanics tells us that causal laws are merely probabilistic, then Kant's theory is again not refuted but just predicts that in that case our temporal judgments cannot be entirely determinate.

In the last section of the 'Principles', Kant assigns empirical criteria to the modal concepts of possibility, actuality and necessity. The main interest of this section lies in the 'Refutation of Idealism' which Kant inserted into it in the second edition. Here Kant argues that temporal judgments about one's own states require reference to objects which endure in a way that mental representations themselves do not, and therefore that consciousness of oneself also implies consciousness of objects external to oneself (B 275-6; also B xxxix-xli). There has been controversy not only about the precise steps of the proof, but also about whether it is supposed to prove that we have knowledge of the existence of things ontologically distinct from our own representations, which seems to undercut

Kant's transcendental idealism. However, the argument of 1787 was actually just the first of many drafts Kant wrote (Reflections 6311-16, 18: 606-23), and these suggest that he did mean to prove that we know of the existence of objects ontologically distinct from ourselves and our states, although we cannot attribute to them as they are in themselves the very spatiality by means of which we represent this ontological distinctness.

Finally, in the *Metaphysical Foundations of Natural Science*, published between the two editions of the *Critique* (1786), Kant carried his a priori investigation of the laws of nature one step further by introducing not only the empirical notion of change itself but also the further empirical concept of matter as the movable in space (4: 480). With this one empirical addition, he claims, he can deduce the laws of phoronomy, the vectorial composition of motions in space; of dynamics, the attractive and repulsive forces by which space is actually filled; of mechanics, the communication of moving forces; and of phenomenology, which in Kant's sense - derived from J.H. Lambert, and very different from its later senses in Hegel or Husserl - means the laws for distinguishing apparent from real motions. This work is not an essay in empirical physics but rather an exploration of the conceptual framework into which the empirical results of physics must be fitted.

8 The illusions of theoretical reason

In the 'Transcendental Dialectic', Kant argues that the doctrines of traditional metaphysics are illusions arising from the attempt to use the categories of understanding to gain information about objects beyond the horizon of our forms of intuition. What makes such illusions inevitable is the tendency of human reason to seek the unconditioned, that is, to carry a chain of ideas to its assumed completion even when that lies beyond the bounds of sense. For example, understanding may tell us that wholes consist of parts, and sensibility may allow us to find a smaller part for any given whole; but only reason suggests that decomposition into parts must come to an end in something absolutely simple, something we could never perceive by sense. In its practical use, reason may produce ideas of the unconditioned, such as the idea of the universal acceptability of maxims of action, which do not tell us anything misleading about the world because they do not tell us anything about how the world is at all, only how it ought to be; but in its theoretical use reason appears to tell us things about the world that cannot be confirmed by our senses or are even incompatible with the forms of our perception.

This diagnosis of metaphysical error makes good sense of Kant's procedure in the 'Antinomy of Pure Reason', where he presents a series of conflicts between the form and limits of sensibility as structured by the understanding, on the one hand, and the pretensions of unconditioned reason, on the other. In early sketches of the *Dialectic* (Reflections 4756-60, 1775-7, 17: 698-713), Kant diagnosed all of the illusions of traditional metaphysics in this form. In the *Critique*, however, Kant singled out some metaphysical beliefs about the self and about God for separate treatment in the 'Paralogisms of Pure Reason' and 'Ideal of Pure Reason'. These sections offer powerful criticisms of traditional metaphysical doctrines, but require a more complex explanation of metaphysical illusion than the single idea of reason's search for the unconditioned.

In the 'Paralogisms', Kant diagnoses the doctrines of 'rational psychology' that the soul is a *substance* which is *simple* and therefore incorruptible, *numerically identical* throughout the experience of any person, and necessarily *distinct* from any external object (this is how he reformulates the Fourth Paralogism in the second edition (B 409)), as a tissue of ungrounded assertions mistaking the logical properties of the *representation* 'I' or the *concept* of the self for the properties of whatever it is in us which actually thinks (A 355/B 409). Kant's criticism of the traditional metaphysics of the soul is convincing, but does not depend on reason's postulation of the unconditioned; instead, Kant's demonstration that these doctrines arise from confusion between properties of a representation and what is represented showed that they were not inevitable illusions by destroying their credibility once and for all.

The four metaphysical disputes that Kant presents in the 'Antinomy of Pure Reason' are often read as straightforward conflicts between reason and sensibility; but Kant characterizes them as disputes engendered by pure reason itself, so a more complex reading is required. In fact, both sides in each dispute - what Kant calls the 'thesis' and 'antithesis' - reflect different forms of reason's demand for something unconditioned, and what conflicts with the limits of sensibility is the assumption that these demands give rise to a genuine dispute at all. Kant again uses the contrast between 'mathematical' and 'dynamical' to divide the four disputes into two groups, and resolves the disputes in two different ways.

In the first antinomy the dispute is between the thesis that the world has a beginning in time and a limit in space and the antithesis that it is infinite in temporal duration and spatial extension (A 426-7/B 454-5). In the second antinomy, the dispute is between the thesis that substances in the world are ultimately composed of simple parts and the antithesis that nothing simple is ever to be found in the world, thus that everything is infinitely divisible (A 434-5/B 462-3). In each case, thesis and antithesis reflect reason's search for the unconditioned, but in two different forms: in the thesis, reason postulates an ultimate *termination* of a series, and in the antithesis, an unconditional *extension* of the series. In these 'mathematical antinomies', however, Kant argues that *neither* side is true, because reason is attempting to apply its demand for something unconditioned to space and time, which are always *indefinite* in extent because they are finite yet always extendible products of our own cognitive activity (A 504-5/B 532-3).

In the two 'dynamical antinomies' Kant's solution is different. In the third antinomy, the thesis is that 'causality in accordance with laws of nature' is not the only kind of causality, but there must also be a 'causality of freedom' underlying the whole series of natural causes and effects, while the antithesis is that everything in nature takes place in accord with deterministic laws alone (A 444-5/B 462-3). In the fourth antinomy, the thesis is that there must be a necessary being as the cause of the whole sequence of contingent beings, either as its first member or underlying it, while the antithesis is that no such being exists inside or outside the world (A 452-3/B 480-1). Again, the theses result from reason's desire for closure and the antitheses result from reason's desire for infinite extension. But now the theses do not necessarily refer solely to spatio-temporal entities, so the claims that there must be a non-natural causality of freedom and a necessary being can apply to things in themselves while the claims that there are only contingent existents linked by laws of nature apply to appearances. In this case both thesis and antithesis may be true (A 531/B 559). This result is crucial to Kant, because it means that although theoretical reason cannot prove that either freedom or God exist, neither can it disprove them, and room is left for the existence of freedom and God to gain credibility in some other way.

The last main part of the 'Dialectic' is Kant's critique of rational theology. Here Kant reiterates his earlier critique of the ontological argument as well as his claim that the arguments for the existence of God from contingency and from design - the 'cosmological' and 'physico-theological' proofs - can only get from their ideas of a first cause or architect to the idea of a *perfect* being by the supposition of the ontological argument, and thus fall along with that. But he now precedes this argument with a critique of the argument for God as the ground of all possibility that he had earlier accepted: the very idea that there is an *ens realissimum*, an individual being containing in itself the ground of 'the sum-total of all possibility' (A 573/B 602), is another of the natural but illusory ideas of reason.

Kant does not, however, conclude the first *Critique* with an entirely negative assessment of pure reason. In an appendix to the 'Transcendental Dialectic', he argues that even though reason in its theoretical use cannot yield metaphysical insight, it does supply us with indispensable 'regulative' principles, of both the maximal simplicity of natural laws and the maximal variety of natural forms, for the conduct of empirical research; and in the 'Canon of Pure Reason', he argues that practical reason supplies an ideal of the highest good, the union of virtue and happiness and ultimately the union of freedom and nature, which is indispensable for moral conduct, not as its direct object but as a necessary condition of its rationality - which in turn gives ground for the practical postulation if not theoretical proof of the existence of God. Kant expands on both of these ideas in subsequent works (see §11 and §13).

9 The value of autonomy and the foundations of ethics

In his theoretical philosophy, Kant argued that we can be certain of the principles that arise from the combination of the forms of our sensibility and understanding, as products of our own intellectual autonomy; but he also argued that any attempt to see human reason as an autonomous source of metaphysical insight valid beyond the bounds of human sensibility leads to illusion. But in his practical philosophy, Kant argues that human reason is an autonomous source of principles of conduct, immune from the blandishments of sensual inclination in both its determinations of value and its decisions to act, and indeed that human autonomy is the highest value and the limiting condition of all other values.

Traditionally, Kant has been seen as an ethical formalist, according to whom all judgments on the values of ends must be subordinated to the obligatory universality of a moral law derived from the very concept of rationality itself. This interpretation has drawn support from Kant's own characterization of his 'paradoxical' method in the

Critique of Practical Reason, where he holds that the moral law must be derived prior to any determination of good or evil, rather than vice versa (5: 62-3). But this passage does not do justice to the larger argument of Kant's practical philosophy, which is that rationality itself is so valuable precisely because it is the means to freedom or autonomy. Kant expressed this in his classroom lectures on ethics, when he said that 'the inherent value of the world, the *summum bonum*, is freedom in accordance with a will which is not necessitated to action' (27: 1482), and even more clearly in lectures on natural right given in the autumn of 1784, the very time he was writing the *Groundwork of the Metaphysics of Morals*, where he said that 'If only rational beings can be ends in themselves, that is not because they have reason, but because they have freedom. Reason is merely a means' (27: 1321). Kant makes the same point in the *Groundwork* when he says that the incomparable dignity of human beings derives from the fact that they are 'free with regard to all laws of nature, obeying only those laws which' they make themselves (4: 435).

The strategy of the *Groundwork* is by no means obvious, and the real character of Kant's view emerges only gradually. In Section I, Kant tries to derive the fundamental principle of morality from an analysis of 'ordinary rational knowledge of morality.' The key steps in his analysis are: virtue lies in the good will of an agent rather than any natural inclination or any particular end to be achieved; good will is manifested in the performance of an action for the sake of fulfilling duty rather than for any other end; and what duty requires is the performance of an action not for the sake of its consequences but because of its conformity to law as such; thus the maxim, or subjective principle, of virtuous action can only be that 'I ought never to act except in such a way *that I can also will that my maxim should become a universal law*' (4: 402). In Section II, Kant apparently tries to reach the same conclusion from more philosophical considerations: by arguing on the one hand that a moral or practical law must be a categorical rather than hypothetical imperative, that is, one commanding unconditionally rather than depending upon the adoption of some antecedent and optional end, and on the other hand that happiness is too indeterminate an end to give rise to such an imperative, Kant concludes that a categorical imperative can contain 'only the necessity that our maxim should conform to this law', thus that 'there remains nothing to which the maxim has to conform except the universality of a law as such' (4: 421). This version of the categorical imperative is known as the Formula of Universal Law.

Kant then furnishes further formulations of the categorical imperative, especially the Formula of Humanity as an End in Itself - '*Act in such a way that you always treat humanity, whether in your own person or in the person of any other, never simply as a means, but always at the same time as an end*' (4: 429), which at the very least requires the possibility of rational consent to your action from any agent affected by it - and the formula of the kingdom of ends, the requirement that any proposed course of action be compatible with 'a whole of all ends in systematic conjunction (a whole both of rational beings as ends in themselves and also of the personal ends which each may set before himself' (4: 433). The usual interpretation is that these two formulations are supposed to follow from the Formula of Universal Law. However, several factors suggest that Kant did not mean the derivation of that formula from either common sense or 'popular moral philosophy' to be self-sufficient, and it is only with the introduction of the notion that humanity is an end in itself because of its potential for freedom, that the real 'ground of a possible categorical imperative' is discovered (4: 428). If so, then this is Kant's theory: the ultimate source of value is human freedom as an end in itself, manifested in interpersonal contexts in the possibility of freely given consent to the actions of others; conformity to the requirement of universal law is the way to ensure that this value is preserved and fostered; and the ideal outcome of the observation of such a law would be a kingdom of ends as a system of freedom, in which all agents freely pursue their freely chosen ends to the extent compatible with a like freedom for all.

10 Duties of right and duties of virtue

In the *Groundwork*, Kant's principle of morality gives rise to a fourfold classification of duties, resulting from the intersection of two divisions: between duties to oneself and to others, and between perfect and imperfect duties. Perfect duties are proscriptions of specific kinds of actions, and violating them is morally blameworthy; imperfect duties are prescriptions of general ends, and fulfilling them is praiseworthy. The four classes of duty are thus: perfect duties to oneself, such as the prohibition of suicide; perfect duties to others, such as the prohibition of deceitful promises; imperfect duties to oneself, such as the prescription to cultivate one's talents; and imperfect duties to others, such as the prescription of benevolence (4: 422-3, 429-30). It is straightforward what a perfect duty prohibits one from doing; it requires judgment to determine when and how the general ends prescribed by

imperfect duties should be realized.

In the later *Metaphysics of Morals*, Kant works out a detailed budget of duties that is generally based on this scheme, but with one key distinction: duties of justice (*Recht*) are those of the above duties that can appropriately be enforced by means of coercion, and the remainder are duties of virtue, which are fit subjects for moral assessment but not coercion (6: 213, 219). Since freedom is Kant's chief value, coercion is permitted only where it is both necessary to preserve freedom and possible for it to do so. This means that only a small subset of our duties, namely some but not all of our perfect duties to others, are duties of justice, thus proper subjects for public legislation; the majority of our moral duties are duties of virtue which are not appropriate subjects for coercive legal enforcement.

Kant's treatment of the duties of virtue is less complicated than that of the duties of justice, and will be considered first. Kant does not explicitly characterize these as duties to preserve and promote the freedom of oneself and others, as he does in the *Groundwork*, but instead characterizes them as duties to promote one's own perfection and the happiness of others: while one can directly perfect one's own freedom, one can avoid injuring but not directly perfect the freedom of another. On close inspection, however, Kant's duties of virtue require precisely that one perfect both the internal and external conditions for the exercise of one's own freedom and at least the external conditions for the exercise of the freedom of others. Thus, ethical duties to oneself include the prohibition of injury to the physical and mental bases of one's free agency, as by suicide or drunkenness, and the prescription of efforts to improve both the physical and mental conditions for the exercise of one's freedom, as by the cultivation of talents and of one's spiritual and moral faculties themselves; and ethical duties to others include both the prohibition of injuries to the dignity of others as free agents, for example by insulting or ridiculing them ('duties of respect'), and the prescription of efforts to improve the conditions for others' exercise of their own freedom, as by beneficience and sympathy ('duties of love').

Kant's foundation of his political philosophy on the duties of justice is more complicated. From the ultimate value of freedom, Kant derives the universal principle of justice, that an action is right only if 'on its maxim the freedom of choice of each can coexist with everyone's freedom in accordance with a universal law' (6: 230). Kant then argues that coercion is justified when it can prevent a hindrance to freedom, since a hindrance to a hindrance to freedom is itself a means to freedom (6: 231). This is too simple, since coercion might only compound the injury to freedom. Kant needs to add that coercive enforcement of the law is not itself a hindrance to freedom, since the threat of juridical sanction does not deprive a would-be criminal of freedom in the way that his crime would deprive its victim of freedom: the criminal exercises the choice to risk sanction, but deprives his victim of a like freedom of choice.

Kant goes on to argue that the only proper aim of coercive juridical legislation is the prevention of injury to the person and property of others; this is 'Private Law', while 'Public Law' concerns the proper form of the state, whose function is the enforcement of private law. Kant takes the prevention of injury to persons to be an obvious requirement of duty, needing no special discussion, but the right to property receives extended discussion.

Kant recognizes three classes of property: property in things, property in contracts, and contract-like property in other persons, such as marital rights. His discussion of property in things is the most important for his political theory. The gist of Kant's account is that it would be irrational to deprive ourselves of the right to place physical objects, above all land, at our own long-term disposal, since we are rational agents who may need to use such things to realize our freely chosen ends, while the things themselves are not free agents and have no rights. But since the earth is initially undivided, specific property rights are not innate but must be acquired. Since the claim to any particular thing would limit the freedom of others who might also be able to use it, however, property rights cannot be claimed unilaterally, but can only be claimed with the multilateral consent of those others, which they can reasonably give only if they too are accorded similar rights necessary for the successful exercise of their own agency (6: 255-6). For Kant, the right to property is thus not a natural right of isolated individuals, but a social creation depending upon mutual acceptability of claims. The state, finally, exists primarily to make claims to property rights both determinate and secure, and anyone claiming property rights thus has both the right and the obligation to join in a state with others (6: 256-7, 306-8). Since property exists only by mutual consent, and the state exists to secure that consent, the state necessarily has the power to permit only those distributions of property rights sufficiently equitable to gain general consent.

Both claims to property and expressions of philosophical and religious opinions, for example, are expressions of human autonomy. But while one person's property claims may directly limit the freedom of others, his beliefs do not, and thus do not require the consent of any other. The state therefore has no right to intervene in these matters. This fundamental difference between the state's proper concern with property and its improper concern with personal belief defines Kant's liberalism. It is only implicit in the *Metaphysics of Morals*, but becomes explicit in more purely political writings.

11 Freedom of the will and the highest good

Having considered some practical implications of Kant's conception of autonomy, we now turn to its metaphysical consequences.

In Section III of the *Groundwork*, Kant attempts to prove that the categorical imperative, derived in Section II by the analysis of the concept of free and rational beings, in general actually puts us under an obligation by proving that we are indeed free and rational beings. In his terminology, he wants to show that it is not merely an analytic but a synthetic a priori proposition that our wills are constrained by this imperative. Both the interpretation and the assessment of the arguments by which he proposes to accomplish this remain controversial.

The first claim that Kant makes is that 'every being who cannot act except under the idea of freedom is just on that account really free in a practical respect, that is, all laws that are inseparably bound up with freedom are valid for it just as if its will were really declared to be free in itself and in theoretical philosophy', and that every being with a will must indeed act under the idea of freedom (4: 448) (see Will, the). This seems to mean that agents who conceive of themselves as choosing their own actions, whether or not they conceive of themselves as subject to determinism, do not or perhaps even cannot consider any antecedent determinants of their actions in deciding what to do, but only what now seems most rational to do; thus they must govern their actions by rational and therefore moral laws. This seems right for agents considering their own future actions, but leaves unclear how we are to assess the freedom of the actions of others or even our own past actions.

However, Kant goes on to offer what seems to be a theoretical and therefore general proof of the existence of human freedom. He argues that theoretical philosophy has shown that we must distinguish between considering ourselves as phenomena and noumena, or members of the sensible and the intelligible worlds. From the first point of view, we must consider our actions to be governed by the causality of nature, while in the second, since we cannot consider our actions there to be governed by no law at all, we must consider them to be governed by another kind of causality, namely causality in accord with laws of reason (4: 451-3). Thus while our actions appear to be determined by natural causes, in reality they not only can but in fact must accord with laws of reason, hence with the categorical imperative.

There are two problems with this argument. First, it flouts transcendental idealism by assuming positive knowledge about things in themselves. Second, as Henry Sidgwick was to object a century later, it precludes moral responsibility for wrong-doing: if the real laws of our behaviour are necessarily rational and hence moral, any wrong-doing could only show that an agent is not rational, and therefore not responsible, at all.

Whether consciously aware of these objections or not, Kant radically altered his argument for freedom of the will in the *Critique of Practical Reason*. Here he does not argue from a theoretical proof of our freedom to the fact of our obligation under the moral law, but conversely from our consciousness of that obligation - the 'fact of reason' - to our freedom as the necessary condition of our ability and responsibility to fulfil it (5: 29-31). This argument first assumes that transcendental idealism has left open at least the theoretical possibility of freedom of the will, and then depends upon the famous principle 'ought implies can' ('Theory and Practice', 8: 287). Transcendental idealism, of course, seems problematic to many; and although the 'ought implies can' principle seems an intuitive principle of fairness, Kant does not actually argue for it. Nevertheless, since this argument assumes only that 'ought' implies '*can*', it does not imply that any agent who is obliged under the moral law necessarily *will* act in accordance with it, and thus avoids Sidgwick's problem about the very possibility of wrong-doing.

Kant depends upon this result in his next major treatment of freedom, in *Religion within the Limits of Reason Alone*, although there he seems to go too far by assuming that evil-doing is not just possible but even necessary. Kant begins this discussion with an elegant account of wrong-doing, arguing that because no human being is simply unaware of the demand of morality - that is implied by the 'fact of reason' - acting immorally never comes

from mere ignorance of it, but rather from deciding to exempt oneself from this obligation. This position is compatible with the argument for freedom in the second *Critique*, although not with that of the *Groundwork*. However, Kant goes on to argue that an evil rather than virtuous choice of fundamental maxim, or 'radical evil', is not only *possible* but inevitable, to be escaped from only by a moral conversion. This doctrine hardly follows from Kant's previous argument, and seems instead to rest on an odd mixture of empirical evidence and the lingering grip of the Christian doctrine of original sin.

The reality of freedom is only the first of Kant's three 'postulates of pure practical reason'; the other two are the existence of God and the immortality of the soul. Again Kant's argument is that, as the first *Critique* showed, neither of these can be proven by theoretical metaphysics, but they can nevertheless be postulated as necessary conditions of something essential to morality. In this case, however, they are conditions not of our obligation under the categorical imperative but for the realization of the 'highest good.' This is another complex and controversial concept. Kant typically defines it as happiness in proportion to virtue, which is worthiness to be happy (5: 110), but suggests different grounds for the necessity of this conjunction. In the *Critique of Practical Reason*, Kant sometimes treats happiness and virtue as two separate ends of human beings, one our natural end and the other our moral end, which we simply seek to combine (5: 110). In other places, however, beginning with the 'Canon of Pure Reason' in the first *Critique*, he holds that since what virtue does is precisely to coordinate our mutual pursuit of ends, and happiness arises from the realization of ends, maximal happiness would inevitably follow maximal virtue under ideal circumstances (A 809/B 837). Of course, circumstances are not always ideal for morality: as far as we can see, no one achieves perfect virtue in a normal lifespan, and such virtue as is attained is hardly always rewarded with happiness. To counter this, Kant holds that we may postulate immortality, in which to perfect our virtue, and the existence of God, who can legislate a nature in which the ends of virtue are achieved.

This theory has seemed to many to be Kant's vain attempt to save his personal faith from his own scathing critique of metaphysics. Before such a claim could even be discussed, we would have to know what Kant really means by a postulate of practical reason. Kant gives several hints about this which have not been adequately explored. In the first *Critique*, he discusses the practical postulates in a section where he considers readiness to bet as a measure of belief, thus suggesting that what he actually has in mind is Pascal's wager (see Pascal, B.): since there is no theoretical disproof of these postulates, and nothing to lose if they are false, but their value to happiness is great, it is rational to act as if they were true. In a later essay, a draft on the 'Real Progress of Metaphysics from the Time of Leibniz and Wolff' from the early 1790s (posthumously published), Kant makes an even more striking suggestion. There he says that in the assumption of the practical postulates 'the human being is authorized to grant influence on his actions to an idea which he, in accord with moral principles, has made himself, just as if he had derived it from a given object' (20: 305). Here the suggestion is that the practical postulates are nothing less than another expression of human autonomy: not theoretical beliefs at all, let alone religious dogmas, but ideas which we construct for ourselves solely to increase our own efforts at virtue. This idea, that God is in fact nothing but an idea of our own making for use within our moral practice, is a thought Kant repeatedly expressed in his very last years (see §14).

12 Taste and autonomy

Under the rubric of 'reflective judgment', defined as that use of judgment in which we seek to find unknown universals for given particulars rather than to apply given universals to particulars (5: 179-80), the *Critique of Judgment* deals with three apparently disparate subjects: systematicity in scientific concepts generally, natural and artistic beauty, and teleology or purposiveness in particular organisms and in nature as a whole (see Teleology). Even more than the idea of reflective judgment, however, what ties these subjects together is again the idea of autonomy.

In the the first *Critique*, Kant had suggested, with but few exceptions, that the search for systematicity in scientific concepts and laws - the subordination of maximally varied specific concepts and laws under maximally unified general ones - is an ideal of reason, not necessary for empirical knowledge but still intrinsically desirable. In the third *Critique*, he reassigns this search to reflective judgment, and argues that we must adopt as a transcendental but indemonstrable principle that nature is adapted to our cognitive needs (5: 185; 20: 209-10). By this reassignment Kant indicates that systematicity is a necessary condition for the acceptance of empirical laws after all, and thus a necessary condition for experience itself. Kant thereby suggests that our empirical knowledge is

neither passively received nor simply guaranteed, but dependent on our active projection of the unity of nature.

Kant next turns to judgments of taste as both a further expression of human autonomy and further evidence that the adaptation of nature to our own cognitive needs is both contingent yet reasonably assumed. Judgments of taste, beginning with the simplest such as ‘This flower is beautiful’ and progressing to more complex ones such as ‘This poem is beautiful’ and ‘This landscape is sublime’, are connected to autonomy in two ways: while they claim universal agreement, they must always be based on individual feeling and judgment; and while they must be made free of all constraint by theoretical or moral concepts, they are ultimately symbols of moral freedom itself.

Kant begins from an analysis of the very idea of an ‘aesthetic judgment’. As aesthetic, judgments of taste must both concern and be made on the basis of the most subjective of human responses, feelings of pleasure, but, as judgments, they must still claim interpersonal agreement (5: 203, 212-16). To retain their link to feelings, judgments of taste can never simply report how others respond, but must be based on one’s own free response to the object itself; in this way they express individual autonomy (5: 216, 282-5). But to claim universal agreement, they must be based on cognitive capacities shared by all, yet by a condition of those faculties that is pleasureable because it is not constrained by rules (5: 187). Such a state is one of ’free play’ between imagination and understanding, in which the imagination satisfies understanding’s need for unity by presenting a form that seems unitary and coherent without any concept, or, even where a concept of human use or artistic intention is inescapable, that seems to have a unity going beyond any such concept - artistic genius lies precisely in such transcendence of concepts (5: 317-18). With debatable success, Kant argues that this ‘free play’ must occur under the same circumstances in all human beings (5: 238-9, 290), and thus that judgments of taste can have the ‘quantity’ of universality and the ‘modality’ of necessity while retaining the ‘quality’ of independence from direct moral interest and ‘relation’ to merely subjective, cognitive interests rather than objective, practical ones.

How does aesthetic judgment so understood both express autonomy in a moral sense and also give further evidence of the contingent adaptation of nature to our own needs? Kant answers the latter question with his idea of ‘intellectual interest’: the very fact that beauty exists, he argues, although it cannot be derived from any scientific laws, can be taken by us as evidence that nature is receptive not only to our cognitive needs but even to our need to see a possibility for success in our moral undertakings (5: 300). Kant’s answer to the first question, how taste expresses autonomy in its moral sense, is more complex but also more compelling than this.

Like other eighteenth-century authors such as Edmund Burke, Kant draws a fundamental distinction between the beautiful and the sublime (see Sublime, the). Beauty pleases us through the free play of imagination and understanding. In our response to the sublime, however - which for Kant is not paradigmatically a response to art, but to the vastness of nature - we enjoy not a direct harmony between imagination and understanding, which are rather frustrated by their inability to grasp such immensities, but a grasp of them which reveals the power of reason within us (5: 257). And this, although it would seem to involve theoretical reason, symbolizes the power of practical reason, and thus the foundation of our autonomy, in two ways: our power to grasp a truly universal law, such as the moral law, and our power to resist the threats of mere nature, and thus the blandishments of inclination (5: 261-2).

In this way, the sublime symbolizes the sterner side of moral autonomy. But the experience of beauty is also a symbol of morality, precisely because the freedom of the imagination that is its essence is the only experience in which any form of freedom, including the freedom of the will itself, can become palpable to us (5: 353-4). Kant thus concludes his critique of aesthetic judgment with the remarkable suggestion that it is in our enjoyment of beauty that our vocation as autonomous agents becomes not just a ‘fact of reason’ but a matter of experience as well.

13 Design and autonomy

Kant’s critique of teleological judgment in the second half of the *Critique of Judgment* has an even more complicated agenda than his aesthetic theory. The work has roots in both eighteenth-century biology - which began the debate, lasting until the twentieth century, whether organisms could be understood on purely mechanical principles - and natural theology - that is, the great debate over the argument from design that culminated in Hume’s *Dialogues concerning Natural Religion*. Yet again Kant’s motive is to show that even our understanding of nature ultimately drives us to a recognition of our own autonomy.

The work is divided into three main sections: an examination of the necessary conditions for our comprehension of individual organisms; an examination of the conditions under which we can see nature as a whole as a single system; and a restatement of Kant's moral theology. First, Kant argues that an organism is a system of whole and parts manifesting both 'regressive' and 'progressive' causality: the whole is the product of the parts, but the parts in turn depend upon the whole for their own proper functioning and existence (5: 372, 376). But our conception of mechanical efficient causation includes only progressive causation, in which the state of any system depends upon the prior state of its parts (see Causation). The only way we can understand the regressive causation of the whole with respect to its parts is by analogy to intelligent design, in which an antecedent *conception* of the object as a whole determines the production of the parts which in turn determine the character of the resultant whole. However, Kant insists, we have absolutely no justification for adopting a 'constitutive concept' of natural organisms as a product of actual design; we are only entitled to use an analogy between natural organisms and products of design as 'a regulative concept for reflective judgment to conduct research into objects in a remote analogy with our own causality in accordance with purposes' (5: 375). In other words, seeing organisms as products of intelligent design is a purely heuristic strategy.

However, Kant next argues that if it is natural for us to investigate organisms as if they were products of intelligent design, then it will also be natural for us to try to see nature as a whole as manifesting a purposive design (5: 380-1); and only by seeing the whole of nature as a product of intelligent design - of course, only regulatively - can we satisfy our craving to transform every particularity of nature, which must always be left contingent by our own general concepts, into something that seems necessary (5: 405-7). However, from a merely naturalistic viewpoint the ultimate purpose of nature as a system must remain indeterminate - grass might exist to feed cows, or cows exist to fertilize the grass (4: 426). Nature can be seen as a determinate system only if it can be seen as collectively serving an ultimate end that is itself an intrinsic end. This can only be humanity itself (4: 427) - but not humanity merely as a part of nature, seeking happiness, which is neither a determinate end nor one particularly favoured by nature (4: 430), but only humanity as the subject of morality, able to cultivate its freedom (5: 435-6). Thus the urge to see nature as a systematic whole, an inevitable concomitant of our research into the complexities of organic life, can only be satisfied from the moral point of view in which human autonomy is the ultimate value.

Kant is still careful to remind us that this doctrine is regulative, furnishing us with a principle for our own cognitive and practical activity, not constitutive, pretending to metaphysical insight into the nature of reality independent from us. It is therefore particularly noteworthy that the last part of the critique of teleological judgment is a restatement of Kant's moral theology, the argument for belief in the existence of God as a postulate of practical reason. This restatement in a general theory of reflective judgment, the principles of which are meant above all else to guide our own activity, confirms the view that in the end the theory of practical postulates is not meant to support any form of dogma but only to serve as another expression of our own autonomy.

14 The final decade of Kant's public and private career

German intellectuals were drawn to political issues after the French revolution in 1789, and Kant was no exception. Key elements of his political philosophy were presented in essays such as 'Theory and Practice' (1793) and *Perpetual Peace* (1795) before its formal exposition in the *Metaphysics of Morals* (1797). As was argued above (§10), the foundation of Kantian liberalism is the idea that coercion is justifiable only to prevent hindrances to freedom, and thus to protect personal freedom and regulate property, every claim to which represents a potential constraint of the freedom of others unless they can reasonably agree to that claim as part of a system of property rights; but individual beliefs and conceptions of the good, whether religious or philosophical, do not directly interfere with the freedom of others and are therefore not a proper object of political regulation. Kant's development of this basic principle into a political philosophy, however, is complex and controversial.

On the one hand, Kant argued from this premise to a firm rejection of any paternalistic government, even benevolent paternalism. Government exists for the protection of the freedom individuals have to determine and pursue their own ends to the extent compatible with the like freedom of others; so a '*paternalistic government*, where the subjects, as minors, cannot decide what is truly beneficial or detrimental to them, but are obliged to wait passively for the head of state to judge how they *ought* to be happy…would be the greatest conceivable *despotism*' (8: 290-1). Further, Kant held that the sovereignty of any government derives solely from the possibility of those who are governed rationally consenting to it, and thus that it is a necessary test of the legitimacy of all laws 'that

they can have arisen from the united will of an entire people' (8: 297). These constraints could best be met in a republic, without a hereditary monarchy or aristocracy pitting proprietary privilege against public right. Finally, Kant argued in *Perpetual Peace*, only in a world federation of republics, where no proprietary rulers could identify the forcible extension of their domains with the aggrandizement of their personal property, could a cessation of warfare ever be expected.

On the other hand, Kant accompanied these liberal doctrines with a denial of any right to violent revolution, which has seemed surprising to many. But Kant's thought here is complex. Underlying his position as a whole is his view that in any situation in which different persons are bound to come into contact with each other we have not merely a moral right but a moral obligation to found or uphold a state. But one could easily argue that a tyranny is a state in name only, and that our moral obligation with regard to a tyranny is precisely to replace it at any cost with a legitimate state. Kant offers several reasons why this is not so. One claim is that violent revolution does not leave time for genuine reform in principles (8: 36), and another argument is that people revolt for the sake of greater happiness, which is an illegitimate reason for the overthrow of a state (8: 298). But these are empirical claims, and do not prove that people cannot revolt solely to remove illegitimate constraints to their freedom. Another argument Kant makes is that a constitution granting a legal right to rebel against the highest authority it creates would thereby not create a single highest authority after all, and would thus be self-contradictory (6: 319). This has seemed to many to be a sophism; but it may have been Kant's attempt to get his liberalism past the Prussian censorship, denying a *legal* right to rebel without ever explicitly denying a *moral* right to rebel.

Kant had been battling censorship even before the death of Frederick the Great in 1786. In 'What is Enlightenment?' (1785), he argued that while persons in an official capacity have to obey orders (in what he confusingly calls the 'private use of reason'), no official, not a professor or even a military officer, has to surrender his right to address his views to 'the entire *reading public*' (the 'public use of reason') (8: 37). But Kant's attack on the necessity of an established church in *Religion within the Limits of Reason Alone* (1793), even though legally published with the imprimatur of a non-Prussian university (Jena), outraged the conservative Frederick William II and his minister Wöllner, and Kant was threatened with punishment if he published further on religion. With an oath of loyalty to his sovereign, Kant promised to desist, but after the death of this king in 1797 he regarded himself as freed from this promise, and the next year issued his most spirited defence of intellectual freedom yet, *The Conflict of the Faculties*. Here Kant argued that while the theological faculty might have the obligation to advance certain dogmas approved by the state, it was nothing less than the official function of the philosophical faculty to subject all views to rational scrutiny; and in any case, a government genuinely concerned with its people's welfare would not want them to base their morality on fear or dogma but only on the free exercise of their own reason. The new government had no stomach for further suppression of the aged philosopher, and Kant was able to publish this defence of intellectual freedom without incident.

Privately, Kant's last years were devoted to the project of closing the gap between the metaphysical foundations of natural science and actual physics, begun about 1796. He never published the work, leaving behind only the notes later published as the *Opus postumum*. Here Kant tried to show that by using the categorial framework and the concept of force we can derive not only the most general laws of mechanics, as he had argued in 1786, but a much more detailed categorization of the forms of matter and its forces. Kant also argued that an imperceptible, self-moving ether or 'caloric' is a condition of the possibility of experience. In the latest stages of this work, however, Kant returned to the broadest themes of his philosophy, and tried to develop a final statement of transcendental idealism. Here he argued that 'The highest standpoint of transcendental philosophy is that which unites God and the world synthetically, under one principle' (21: 23) - where that principle is nothing other than human autonomy itself. God and the world are 'not substances outside my thought, but rather the thought through which we ourselves make these objects' (21: 21): the world is our experience organized by categories and laws of our own making, and God is the representation of our own capacity to give ourselves the moral law through reason. The moral law 'emerges from freedom…which the subject prescribes to himself, and yet as if another and higher person had made it a rule for him. The subject feels himself necessitated through his own reason…' (22: 129). This is a fitting conclusion to Kant's philosophy of autonomy.

PAUL GUYER

List of works

Citations to Kant, with the exception of the *Critique of Pure Reason*, are standardly located by the appropriate volume and page number in Kant (1900-). This practice has been followed in this entry by giving the arabic volume number followed by the arabic page number. Citations to the *Critique of Pure Reason* are given with the pagination of the first (A) and/or second (B) editions, according to whether the passage occurred in one or both editions.

1 German editions

Kant, I. (1900-) *Kant's gesammelte Schriften (Kant's Collected Works)*, ed. Royal Prussian (subsequently German) Academy of Sciences, Berlin: Georg Reimer, subsequently Walter de Gruyter, 29 vols, in 34 parts.(27 volumes are published so far. The edition is divided into four parts: *Werke (Works)* (vols 1-9), *Briefe (Letters)* (vols 10-13), *Handschriftlicher Nachlaß (Handwritten remains)* (vols 14-23), and *Vorlesungen (Transcriptions of lectures by other hands)* (vols 24-29, no volumes 25 and 26). This edition, referred to as the 'Akademie' edition, is the most complete collection of Kant's works. While some of its texts of Kant's published works have been superseded, it remains the only source for most of Kant's unpublished notes and lectures.)

Kant, I. (1956-62) *Immanuel Kant: Werke in sechs Bänden (Immanuel Kant: Works in Six Volumes)*, ed. W. Weischedel, Wiesbaden: Insel; repr. (in 12 vols but with original pagination) Frankfurt am Main: Suhrkamp Verlag, 1968.(A more modern edition of Kant's published works only, also including German translations of Kant's Latin works. Orthography is modernized, but the texts are more reliable than in the older Akademie edition.)

Kant, I. (1990) *Kritik der reinen Vernunft (Critique of Pure Reason)*, ed. R. Schmidt, with bibliography by Heinrich Klemme, Hamburg: Felix Meiner, 3rd edn.(Published in the Philosophische Bibliothek series. This edition was the basis for N. Kemp Smith's translation)

Kant, I. (1996) *Kritik der reinen Vernunft Reclam (Critique of Pure Reason)*, ed. I. Heidemann, Stuttgart: Philipp Reclam Jun.(Published in the Universal-Bibliothek series. The best modern edition of the work)

2 English translations

The Cambridge Edition of the *Works of Immanuel Kant*, edited by P. Guyer and A.W. Wood, will provide new or revised translations of all of the works Kant published in his lifetime and extensive selections from his letters, his surviving notes, drafts and fragments and surviving transcriptions of his lectures. As of 1998, the following volumes had appeared:

Kant, I. (1992) *Theoretical Philosophy, 1755-1770*, trans. and ed. D. Walford, in collaboration with Ralf Meerbote, Cambridge: Cambridge University Press.(Contains all of Kant's writings up to 1770 except for scientific works and *Observations on the Feeling of the Beautiful and Sublime*. Important works contained in this volume include his first metaphysical treatise of 1755, the *Only Possible Basis for a Demonstration of the Existence of God* (1763), the *Dreams of a Spirit-Seer* (1766), and the inaugural dissertation of 1770.)

Kant, I. (1992) *Lectures on Logic*, trans. and ed. J.M. Young, Cambridge: Cambridge University Press.(Contains the authorized handbook edited by G.B. Jäsche in 1800, and three complete sets of lecture notes from the early 1770s, 1780s and 1790s.)

Kant, I. (1993) *Opus postumum*, ed. E. Förster, trans. E. Förster and M. Rosen, Cambridge: Cambridge University Press.(Contains extensive selections from the surviving manuscripts of Kant's attempt to write a final book that would both restate the principles of his transcendental idealism and also complete the application of his fundamental principles to natural science.)

Kant, I. (1996) *Practical Philosophy*, ed. and trans. M.J. Gregor with introduction by A.W. Wood, Cambridge: Cambridge University Press.(Includes new translations of the *Groundwork of the Metaphysics of Morals* and *Critique of Pure Reason*, a revised edition of Gregor's previous translation of the *Metaphysics of Morals*, and Kant's occasional essays on moral and political philosophy.)

Kant, I. (1996) *Religion and Rational Theology*, ed. and trans. G. Di Giovanni and A.W. Wood, Cambridge: Cambridge University Press.(Includes a new translation of *Religion within the Boundaries of Mere Reason*; the *Conflict of the Faculties*, which presents Kant's main argument for the intellectual freedom of philosophers; and Kant' lectures on philosophical theology.)

Kant, I. (1997) *Lectures on Ethics*, ed. P. Heath and J.B. Schneewind, trans. P. Heath, Cambridge: Cambridge University Press.(Contains complete sets of notes from 1775-84, 1784-5 and 1793-4.)

Kant, I. (1997) *Lectures on Metaphysics*, ed. and trans. K. Ameriks and S. Naragon, Cambridge: Cambridge

University Press.(Contains complete lecture series from the mid-1770s, 1782-3, 1790-1 and 1794-5, as well as selections from other sets of notes as early as 1762-4. Kant's views on both empirical and rational psychology are particularly well represented.)

Kant, I. (1998) *Critique of Pure Reason*, ed. and trans. P. Gruyer and A.W. Wood, Cambridge: Cambridge University Press.(In addition to an extensive introduction and cross-references to many relevant notes among Kant's literary remains, this is the first edition of the *Critique* to include all of Kant's notes in his own copy of the first edition of 1781.)

3 Individual works

Kant, I. (1911) *Critique of Aesthetic Judgement*, trans., with analytical indexes, J.C. Meredith, Oxford: Clarendon Press.

Kant, I. (1928) *Critique of Teleological Judgement*, trans., with analytical indexes, J.C. Meredith, Oxford: Clarendon Press.

Kant, I. (1997) *Prolegomena to Any Future Metaphysics, with selections from the Critique of Pure Reason*, ed. and trans. G. Hatfield, Cambridge: Cambridge University Press.(A reliable revision of the Paul Carus translation of 1902.)

Kant, I. (1952) *Kant's Critique of Judgement*, trans. J.C. Meredith, Oxford: Clarendon Press.(Reprint of Kant (1911) and (1928), without indices. While loose, Meredith's remains the most felicitous translation of *Critique of Judgment*.)

Kant, I. (1960) *Observations on the Feeling of the Beautiful and Sublime*, trans. J.T. Goldthwait, Berkeley and Los Angeles, CA: University of California Press.

Kant, I. (1965) *First Introduction to the Critique of Judgment*, trans. J. Haden, Indianapolis and New York: Bobbs-Merrill.(Better than Pluhar's translation, but now hard to find.)

Kant, I. (1967) *Kant: Philosophical Correspondence 1759-99*, trans. A. Zweig, Chicago, IL: University of Chicago Press.(A selection of the most philosophically interesting letters with useful annotations.)

Kant, I. (1968) *Selected Pre-Critical Writings and Correspondence with Beck*, trans. G.B. Kerferd and D.E. Walford, with a contribution by P.G. Lucas, Manchester and New York: Manchester University Press and Barnes & Noble.(Includes Kant's correspondence with Marcus Herz in the 1770s and J.S. Beck in the 1790s, not included in Kant's *Theoretical Philosophy, 1755-1770*.)

Kant, I. (1969) *Universal Natural History and Theory of the Heavens*, trans. W. Hastie, with new introduction by M.K. Munitz, Ann Arbor, MI: University of Michigan Press.(Antiquated translation.)

Kant, I. (1970) *Metaphysical Foundations of Natural Science*, trans. J. Ellington, Indianapolis and New York: Bobbs-Merrill; repr., with *Prolegomena*, in *Philosophy of Material Nature*, Indianapolis, IN: Hackett, 1985. (The only translation currently available.)

Kant, I. (1973) *The Kant-Eberhard Controversy: An English translation together with supplementary materials and a historical-analytical introduction of Immanuel Kant's On a New Discovery According to which Any New Critique of Pure Reason Has Been Made Superfluous by an Earlier One*, trans. H.E. Allison, Baltimore, MD: The Johns Hopkins University Press.(Kant's polemical defence of the idea of the synthetic a priori from the Wolffians, with valuable supplementary material.)

Kant, I. (1974) *Anthropology from a Pragmatic Point of View*, trans. M.J. Gregor, The Hague: Martinus Nijhoff.

Kant, I. (1983) *What Real Progress Has Metaphysics Made in Germany since the Time of Leibniz and Wolff?*, trans. T. Humphrey, New York: Abaris Books.(Only English translation of this unfinished competition entry, posthumously published by Rink in 1804.)

Kant, I. (1986) *Kant's Latin Writings: Translations, Commentaries, and Notes*, trans. L.W. Beck, M.J. Gregor, R. Meerbote and J.A. Reuscher, New York, Bern, Frankfurt and Paris: Peter Lang.(Includes some fragments not included in Kant's *Theoretical Philosophy, 1755-1770*.)

Kant, I. (1987) *Critique of Judgment: Including the First Introduction*, trans. W.S. Pluhar, Indianapolis, IN: Hackett Publishing Company.(While the English is infelicitous and the editorial intervention excessive, this does include the only translation of the 'First Introduction' still in print.)

Kant, I. (1991) *The Metaphysics of Morals*, trans. M.J. Gregor, Cambridge: Cambridge University Press.(The first single-volume translation of both the Rechtslehre and Tugendlehre, supersedes all earlier separate translations.)

Kant, I.(1991) *Kant's Political Writings*, ed. H. Reiss, trans. H.B. Nisbet, Cambridge: Cambridge University Press, 2nd edn.(Includes most of what is in Kant on history as well as 'Theory and Practice' and 'Public Right' from the Rechtslehre.)

Kantian ethics

Kantian ethics originates in the ethical writings of Immanuel Kant (1724-1804), which remain the most influential attempt to vindicate universal ethical principles that respect the dignity and equality of human beings without presupposing theological claims or a metaphysical conception of the good. Kant's systematic, critical philosophy centres on an account of reasoning about action, which he uses to justify principles of duty and virtue, a liberal and republican conception of justice with cosmopolitan scope, and an account of the relationship between morality and hope.

Numerous contemporary writers also advance views of ethics which they, and their critics, think of as Kantian. However, some contemporary work is remote from Kant's philosophy on fundamental matters such as human freedom and reasoning about action. It converges with Kant's ethics in claiming that we lack a substantive account of the good (so that teleological or consequentialist ethics are impossible), in taking a strong view of the equality of moral agents and the importance of universal principles of duty which spell out what it is to respect them, and in stressing an account of justice and rights with cosmopolitan scope.

Both Kant's ethics and contemporary Kantian ethics have been widely criticized for preoccupation with rules and duties, and for lack of concern with virtues, happiness or personal relationships. However, these criticisms may apply more to recent Kantian ethics than to Kant's own ethics.

1 Kant's ethics

Kant's main writing on ethics and politics can be found in *Grundlegung zur Metaphysik der Sitten (Groundwork of the Metaphysics of Morals)* (1785), *Kritik der practischen Vernunft (Critique of Practical Reason)* (1788), *Die Metaphysik der Sitten (The Metaphysics of Morals)* (1797) and numerous sections of other works and free-standing essays. Throughout these writings he insists that we cannot derive ethical conclusions from metaphysical or theological knowledge of the good (which we lack) or from a claim that human happiness is the sole good (which we cannot establish). We lack the basis for a teleological or consequentialist account of ethical reasoning, which therefore cannot be simply a matter of means-ends reasoning towards some fixed and knowable good (see Consequentialism; Teleological ethics).

Yet if reasoning about action, that is practical reasoning, is not means-end reasoning, what can it be? Kant's alternative account proposes simply that reasons for action must be reasons for all. He insists that we can have reasons for recommending only those principles of action which could be adopted by all concerned, whatever their particular desires, social identities, roles or relationships. Correspondingly, practical reasoning must reject any principles which cannot be principles for all concerned, which Kant characterizes as *non-universalizable* principles (see Universalism in ethics §5).

Kant gives this rather limited modal conception of practical reasoning some grand names. He calls it the 'supreme principle of morality' and the 'categorical imperative'. He formulates this fundamental principle of ethics in various ways. The formulation most discussed in the philosophical literature runs 'act only on that maxim [principle] through which you can at the same time will that it become a universal law' ([1785] 1903: 421). The formulation that has had and still has the greatest cultural resonance requires us to treat others with impartial respect. It runs 'treat humanity…never simply as a means, but always at the same time as an end' ([1785] 1903: 429) (see Respect for persons §2). The equivalence of these two formulations of the categorical imperative is far from obvious. One way of glimpsing why Kant thought they were equivalent is to note that if we treat others as persons rather than as things then we must not destroy or impair their abilities to act, indeed must leave it open to them to act on the same principles that we act on; hence we must act on universalizable principles. On Kant's view, one of the worst features of consequentialist ethics is that it not merely permits but requires that persons be used as mere means if this will produce good results.

Kant claims that the categorical imperative can be used to justify the underlying principles of human duties (see Duty §2). For example, we can show by a *reductio ad absurdum* argument that promising falsely is not universalizable. Suppose that everyone were to adopt the principle of promising falsely: since there would then be much false promising, trust would be destroyed and many would find that they could not get their false promises

accepted, contrary to the hypothesis of universal adoption of the principle of false promising. A maxim of promising falsely is not universalizable, so the categorical imperative requires us to reject it. Parallel arguments can be used to show that principles such as those of coercing or doing violence are not universalizable, and so that it is a duty to reject these principles.

Kant calls duties such as these *perfect* (namely, complete) duties. These are duties which can observed by each towards all others. He also provides arguments to establish the principles of certain *imperfect* (namely, incomplete) duties, such as those of helping others in need or developing one's own talents. One way in which imperfect duties are unavoidably incomplete is that they cannot be observed towards all others: nobody can help all others, or develop all possible talents. Kant calls these imperfect duties 'duties of virtue' (see Virtues and vices §§2-3).

The derivation of principles of duty from his conception of practical reason is the core of Kant's ethics, and provides the context for his discussion of many other themes. These include: the difference between internalizing principles and merely conforming to them in outward respects ('acting out of duty' versus 'acting according to duty'); the place of happiness in a good life; the need for judgment in moving from principle to act (see Moral Judgment §2); the justification of state power; and the justification of a cosmopolitan account of justice. He also develops the connections between his distinctive conceptions of practical reason and of freedom and his equally distinctive view of religion, which he sees as a matter not of knowledge but of reasoned hope for a future in which morality can be fully realized. In some works Kant articulates reasoned hope in religious terms; in others he articulates it in political and historical terms as a hope for a better this-worldly human future (see Hope §3).

2 Contemporary Kantian ethics

Much contemporary work on ethics is labelled Kantian, in the main because it does not derive an account of right action from one of good results, but rather sees the right as prior to the good (Right and good). In contemporary Kantian work obligations and rights are the fundamental ethical notions. Such work is often called *deontological ethics* (the term derives from the Greek word for *ought*) (see Deontological ethics). Deontological ethical theories are contrasted with teleological or consequentialist theories, which treat the good as prior to the right. Deontological theories are concerned with ethically required action, hence with principles, rules or norms, with obligations, prohibitions and permissions, and with justice and injustice, but not with virtues, good lives, moral ideals and personal relationships (see Fried 1978; Gewirth 1978).

Deontological ethics has many distinct forms. Many versions endorse one or another interpretation of the Kantian demand to respect persons, and think that moral principles should be universal; few mention Kant's minimalist strategy for justifying certain universally binding principles as those we must live by if we reject non-universalizable principles. Indeed, many deontological ethical theories rely on conceptions of freedom, reason and action which are unlike Kant's, and resemble those typically used by consequentialists.

One prominent range of deontological positions seeks to justify principles of justice by showing that they would be agreed to by all concerned under certain hypothetical conditions. They draw on the thought that agreements and contracts are good reasons for action, and suggest that all ethical claims are to be justified by showing that they are based if not on actual then on hypothetical agreements or contracts. These sorts of deontological theories are often called *contractarian* or *contractualist*; they are contemporary versions of social contract theories (see Contractarianism).

Some contractualists take a Hobbesian rather than a Kantian approach. They argue that principles of justice are those on which instrumentally rational persons, guided by their individual preferences, would agree (see Hobbes, T. §§6-7). Other contractualists take a more Kantian approach. They argue that principles of justice are those which would be accepted or agreed to by persons who are not merely instrumentally rational but can use certain reasonable procedures.

The best known exponent of Kantian contractualism is John Rawls, whose *A Theory of Justice* (1971) identifies principles of justice as those that would be agreed by rational and self interested beings in circumstances which ensure that their choosing will be reasonable as well as rational (see Rawls 1980, 1993). He argues that principles of justice would emerge if they were chosen by all concerned in a hypothetical situation devised to ensure impartiality and hence agreement. Rawls calls this hypothetical situation 'the original position', and represents it as one in which persons are ignorant of their own social position and personal attributes, hence of their own

advantage, hence cannot but be impartial.

Rawls claims that rational persons in this hypothetical situation would choose principles of justice that prescribe equal rights for all and the highest attainable level of wellbeing for the worst off. Since everything that differentiates individuals, and could thus provide a basis for disagreement, for bargaining, or for a need to seek agreement, is carefully excluded from the original position, it is not obvious why principles chosen in it should be thought of as matters of *agreement*, or why the parties to the original position should be thought of as *contracting* with one another. Nor is it clear why the fact that certain principles would be agreed to under these conditions justifies those principles to those in other situations. Why are principles which would be agreed to under conditions that do not obtain binding under conditions that actually obtain?

In *A Theory of Justice* Rawls argues that principles that would be so agreed are binding in other situations because they cohere, or form a 'reflective equilibrium' with 'our considered judgments' (see Moral justification §2). Principles are justified not merely because the instrumental reasoning of the hypothetically ignorant would select them, but because we would reasonably judge them congruent with our most carefully considered moral views. In his later *Political Liberalism* (1993) Rawls depicts these principles as the outcome not of hypothetical agreement in an original position, but as the hypothetical agreement of persons who are not only rational but reasonable, in the sense that they are willing to abide by principles given assurance that others will do so too (1993: 49). Principles and institutions are just if they are the focus of reasonable agreement by all concerned.

Jürgen Habermas has also advocated versions of Kantian ethics which stress agreement between agents. In earlier work he argued that the test of justification or legitimation is that a proposal would be agreed in a hypothetical 'ideal speech situation', in which communication was undistorted. In more recent work (1993), he has argued that legitimation of norms is achieved through processes of public discourse, to which each can contribute and in which all can agree.

3 Criticisms of Kantian ethics

Both Kant's ethics and contemporary Kantian ethics have been criticized from many quarters. The critics evidently include those who advocate one or another form of teleological or consequentialist theory, who believe that it is possible to establish an account of the good, from which a convincing account of the right, and specifically of justice, can be derived. However, they also include a variety of writers who reject consequentialist thinking, including communitarians, virtue ethicists, Wittgensteinians and feminist thinkers (see Community and communitarianism; Virtue ethics; Wittgensteinian ethics; Feminist ethics).

The most common and general criticisms are that, because it concentrates on principles or rules, Kantian ethics is doomed to be either empty and formalistic or rigidly uniform in its prescriptions (the complaints cannot both be true). The charge of empty formalism is based on the correct observation that principles underdetermine action; it is usually countered with the equally correct observation that quite indeterminate principles (such as 'Stay within the budget' or 'All religions are to be tolerated') may set significant constraints on action, so are not empty. The charge of rigidly uniform prescriptivity is based on the thought that rules prescribe, so must regiment. It is usually countered by the reminder that since rules can be indeterminate, they need not regiment: universal principles need not be uniformly prescriptive. An ethical theory that applies to principles can be more than empty and less than rigid.

Other critics object that since Kantian ethics focuses on obligations and rights, and in good measure on justice, it either must or does neglect other ethical categories, and in particular the virtues, good character or good lives; that 'natural and human rights…are fictions' (MacIntyre 1981: 67); and that obligations inevitably conflict in ways that render all deontological ethics incoherent. Some critics have laid particular stress on the point that in requiring impartial respect for all, Kantian ethics wholly ignores the place of happiness, of the emotions, of personal integrity and above all of personal relationships in the good life (see Morality and emotions §§2, 4). They have claimed that we must choose between an ethics of justice and one of care, an ethic of rules and one of relationships, an ethic of duty and one of virtue, and that the latter term of each pair is to be preferred.

4 Back to Kant?

Some of these criticisms are accurately aimed at significant features of various forms of contemporary Kantian

writing in ethics; many of them are less apt as criticisms of Kant's ethics. Several recent writers have suggested that Kant's ethics is the most convincing form of Kantian ethics, and that its distinctive features are strengths rather than weaknesses. Many of these writers accept much of the critique of deontological ethics, but think that not all the criticisms apply to Kant's ethics, of which they offer detailed interpretations. Part of their effort has gone into work on Kant's conceptions of action, reason and freedom, and part into work on his ethics. They have pointed out that Kant's account of practical reason and of its vindication does not assume either that all reasoning about action is instrumentally rational pursuit of preferred ends, or that ethical vindication is located in hypothetical agreements or contracts reached by reasonable procedures. They have stressed that Kant's conception of practical reason is based on universalizability rather than impartiality or reciprocity and that he views obligations rather than rights as basic to ethics. They have insisted that impartial respect for persons and a cosmopolitan approach to justice are not morally negligible matters, and have criticized communitarians, virtue ethicists and some feminist thinkers for not taking justice seriously. They have also pointed out that Kant offers accounts of the virtues, of the role of happiness in the good life, and of judgment, and argued that his position is not damagingly individualistic and that he acknowledges the importance of institutions and of social and personal relationships in human life (see Hill 1992; Korsgaard 1996; Herman 1993; O'Neill 1989).

Kaplan, Mordecai (1881-1983)

Kaplan argued that Judaism was the evolving religious civilization of the Jewish people. He attempted to recast an inherited faith in rational and natural terms. His advocacy of Jewish communalism, Jewish cultural expression in literature and art, and creativity and experimentation in liturgy had a pronounced impact on wide circles of US Jews. He took seriously the challenge to the traditional interpretation of religious values from science and modernity, and sought to establish a form of religion that was both intellectually respectable and communally responsible. Kaplan's distinctive analysis of Jewish peoplehood and the Jewish religion responsed to a wide variety of philosophical and theological perspectives and challenges.

1 Crisis and challenge

Reconstructionism, the movement in Judaism founded by Mordecai Kaplan, grew out of his perception that the modern era posed a unique threat to the continuity of Judaism and the Jewish people. The corporate political character of the medieval European Jewish community had ceased to exist and Jews no longer constituted an *imperium in imperio*. Instead, with the rise of modern political structures, Jews, like others, were enfranchised as individual citizens of a modern nation-state. Judaism had to adapt to the demands of a democratic national order where the status of the Jews as a discrete political entity was lost.

Kaplan contended that the rise of naturalism undermined a number of foundational beliefs that had sustained Jewish solidarity during the Middle Ages (see Solidarity). Modern men and women, he held, could no longer entertain belief in a supernaturalistic God who would miraculously intervene in the affairs of persons and the processes of nature. Nor could they affirm the idea of otherworldly reward and punishment. The dogma that God had revealed eternal written and oral laws to Moses at Sinai, as well as the belief that the rabbis had received a divine mandate as the legitimate expositors of those laws, were in his view no longer tenable. As a result of the collapse of these beliefs, Kaplan observed, most Jews no longer asserted that God had chosen the Jews from among all peoples for a special relationship, nor did they contend that the observance of Jewish law would allow the individual to attain otherworldly salvation after death.

All this led the Jewish masses to abandon their fidelity to Jewish law. As the strength of the rabbis diminished and the observance of Jewish law faltered, the bond that tied Jews together became increasingly looser. Judaism was endangered because no convincing rationale for justifying the existence of the Jews as a distinct and vital community obtained in the present day. The forces of modern nationalism and naturalism had combined to destroy the structure and rationale that had promoted Jewish group survival for centuries, forcing a crisis of continuity upon the Jewish people.

As Kaplan acknowledged, others had recognized and attempted to respond to this crisis. Yet, in his opinion, all previous attempts had failed. Kaplan condemned both the Reform movement and neo-orthodoxy for overly intellectualizing and spiritualizing Judaism. Each had forsaken Jewish peoplehood and each - in its own way - had consigned Judaism to the status of a religious confession. Nor did the political Zionism of Herzl fare better in Kaplan's analysis (see Zionism). Its truncated vision of the Jewish past was inauthentic, for it made no room for the religious elements of Jewish civilization. Kaplan maintained that only a reconstructionist conception of Judaism, and the course of action that flowed from it, could preserve Judaism and the Jewish people from the impairments brought on by the modern age.

2 The response of reconstructionism

Kaplan's reconstructionism was a mixture of philosophical, sociological and religious elements. He drew eclectically from thinkers as diverse as Matthew Arnold, John Dewey, Emile Durkheim, William James and George Herbert Mead. He also drew upon the ancient rabbis and the contemporary cultural Zionist Ahad Ha'am. His aim was to formulate an ideology that would preserve the identity, unity and continuity of the Jewish people and its religion in the modern world. At the core of his thought lay a social existentialism: the existence of the Jewish people must be set prior to any attempt to define its essence (see Existentialism).

Kaplan's reconstructionism focused on the proposition that Judaism was the creation of the Jewish people and, as such, existed for the people's sake. Underpinning all of his teaching was his conviction that religion, like all

human life, was subject to change. Reflecting his sociological bent, Kaplan contended that the Jewish people, as the authors of their own religious forms, had engaged throughout history in a process of definition and redefinition of these forms. Judaism was conceived as the evolving religious civilization of the Jewish people. The meaning attached to the various rites of Judaism, as well as the concepts of God and Torah, had to be understood and evaluated only in relation to the reality of a living Jewish people. Theology and abstract ideas had a place in Judaism, but that place was a pragmatic one, designed to enhance the life of the group and the individuals who constituted it. In keeping with this agenda, Kaplan set out to redefine Jewish beliefs and rituals in a manner consonant with what he identified as the modern spirit.

This led him to foster a ‘Copernican Revolution’ in Jewish thought, placing the people of Israel, not its God, at the centre of Jewish religious reflection. Kaplan refused to countenance any notion of God as a supernatural being and advanced instead a naturalistic conception of God as that process in the universe which makes for human salvation. He contended that God was that power in the universe, not ourselves, which makes for order, justice and goodness, and which helps men and women to achieve self-fulfilment in this world (see God, concepts of).

Kaplan rejected the idea that God had chosen the people of Israel. For him, the idea of divine election was unacceptable both in its traditional supernatural form and in various modern reformulations. The concept of a chosen people served no functional purpose in contemporary society, for it failed to promote Jewish survival in any meaningful way. Indeed, the exclusivity of the concept raised serious questions about the morality of a God who would display such divine favouritism and was incompatible with modern democratic universalism. Indeed, the idea of chosenness entailed a claim to superiority that could only inflame rivalry and heighten tensions between Jews and their non-Jewish neighbours. Accordingly, Kaplan replaced the idea of a chosen people with that of ‘vocation’, the calling by which every individual and nation seeks to develop and use its powers for the benefit of humanity.

Kaplan affirmed the importance of religious ritual in Jewish life. He recognized that rites and rituals provided for structure and stability in Jewish life (see Ritual). However, he would not countenance rituals as part of a supernaturally revealed code of Jewish law, nor would he envisage them as divine commandments. Instead, he identified Jewish rituals and rites as ‘folkways’ and ‘sancta’, and asserted that they embodied the sacred values of Judaism and served as the cement which bound the Jewish people together across time and space. Nevertheless, in a growing and evolving civilization such as Judaism, old forms at times become obsolete and new forms of religious expression must be developed to take their place. Kaplan, in a famous aphorism, asserted ‘The past has a vote, but not a veto’. Kaplan ceded Zionism and the State of Israel a major place in his thought. Like Ahad Ha’am, he believed that Zionism would serve to unify and awaken the Jewish people to its particular destiny, and he contended that the State of Israel would serve to regenerate the Jewish people in its contemporary state of disintegration and dissolution.

Kaplan believed that his thought would provide a basis for a modern-day expression of Judaism which would foster the establishment of an ‘organic community’ where all the elements that constitute a civilization could play a role in the life of the Jew. He viewed the synagogue as central to this process of community-building, and asserted that it had to function as more than a house of prayer and study. Kaplan therefore set out to ‘reconstruct’ the synagogue to meet the challenge of the day. He proposed that this institution be converted into an all-embracing centre of Jewish cultural and social activity. The synagogue building would become a Jewish centre, complete with swimming pool, gym, library and other facilities, the primary purpose of which would no longer be worship, but ‘social togetherness’. The large number of contemporary synagogues which follow this pattern, either wholly or in part, provides ample testimony to the influence of Kaplan’s ideals on the US Jewish landscape. His programme of Jewish reconstructionism transcended denominational affiliations. While Kaplan had more than his share of theological and philosophical critics, there is no doubt that his death at the age of 102 brought to a close the life of one of the seminal figures in US Jewish religious history.

Karaism

*The Karaites (*qara'im*, or* benei miqra*) take their name from the Hebrew word for Scripture. The sect's scripturalism originated in its rejection of the 'Oral Law' embodied in rabbinic literature. Like earlier scripturalist groups - notably the Sadducees - Karaites sought to derive their practices directly from the biblical text. While Karaism is usually traced to mid-eighth-century Iraq, the early history remains murky. The sect crystallized in the Islamic East during the late ninth and early tenth centuries, calling forth stern reactions from the leaders of mainstream rabbinic Judaism. Although harsh at times, the ensuing polemics stimulated both Karaite and Rabbanite scholarship in the fields of biblical exegesis, Hebrew grammar and lexicography, jurisprudence and religious philosophy. The two groups differed sharply over points of law and practice - the calendar, dietary laws, Sabbath regulations - but typically concurred on questions of theology.*

1 The Mu'tazilite phase

Early medieval Jewish thinkers of both Rabbanite and Karaite persuasion found the *kalam* (speculative theology) of the Muslim rationalistic school known as the Mu'tazila congenial to their outlook and adopted many Mu'tazilite ideas (see Ash'ariyya and Mu'tazila). The Mu'tazilites' uncompromising definitions of God's unity and justice inform the writings of leading Rabbanites like Saadiah Gaon (d. 942) and Samuel ben Hofni Gaon (d. 1013). During the mid-tenth to mid-twelfth centuries, their Karaite contemporaries also produced works closely modelled upon Mu'tazilite patterns.

Widespread knowledge of Arabic facilitated the appropriation of Islamic theology by Eastern Jewish thinkers. Paralleling the doxographic interests of his Muslim contemporary, the *mutakallim* al-Ash'ari (d. 935), Ya'qub al-Qirqisani (d. after 938) betrays a lively interest in the history of Jewish sects. His *Kitab al-anwar wa'l-marakib (Book of Lights and Watchtowers)*, a comprehensive Karaite code, incorporates discussions of epistemology, philosophy of law, and theology. In this, it resembles the codes of later thinkers active in the Islamic world such as Al-Ghazali (d. 1111) and Maimonides (d. 1204).

While al-Qirqisani lived in Iraq, the main centre of Karaite spiritual and intellectual activity during the tenth and eleventh centuries was Jerusalem. Ascetic and apocalyptic in outlook, the Karaite Mourners for Zion preached a strict regime of repentance, prayer and Bible study. Their writings evince a certain hostility to 'alien wisdom' but do endorse some Mu'tazilite teachings. The commentaries of Japheth ben Eli - originally covering the entire Bible and largely extant in manuscript - include long speculative excursuses and strikingly apply *kalam* doctrines to the explication of such passages as Genesis 1-2, Genesis 22 and Job.

Karaism became truly scholastic with the assimilation of works emanating from the Mu'tazilite school of Basra. The writings of the Mu'tazilite theologian 'Abd al-Jabbar (d. 1025) powerfully influenced such leading Karaites as Yusuf al-Basir (Joseph ben Abraham, d. 1040) and Abu'l-Furqan ben al-Asad (Yeshu'ah ben Judah, d. after 1065). Structured around the doctrines of divine unity and justice, Yusuf's *al-Kitab al-muhtawi (Comprehensive Treatise)* is a compendium of Karaite *kalam*. Its forty chapters grapple with most of the salient issues confronting Jewish (and Muslim) *mutakallimun*. Under the rubric of divine unity we find discussions of epistemology and the obligation to engage in speculative theology (chapters 1-2), physical theories (3), existence of the Creator (4), the divine attributes - omnipotence, omniscience, existence and eternity - and their essential nature (5-11), divine incorporeality and unity (12-14) and the createdness of God's speech (15). Under the second major heading of Mu'tazilite theology, divine justice, we find discussions of God's will and self-sufficiency (chapters 16-17), theodicy (18-26), human free will (27-31), revelation and divine obligation (32-36) and reward, punishment, merits and repentance (37-40).

Like 'Abd al-Jabbar, Yusuf was a jurist. Theology naturally impinged on his juridical writings. In discussing circumcision, for example, he considers such questions as intention, compensation for suffering and the nature of obligation. His disciple Yeshu'ah ben Judah prefaces a treatise on marriage law with an elaborate epistemology. His Bible commentaries show a much greater interest in *kalam* problems than is evident in those of his predecessor Japheth ben Eli.

Like the Mu'tazilites - but unlike the Rabbanites - both Yusuf and Yeshu'ah believed that all bodies are composed

of atoms, in which accidents reside (see Atomism, ancient; Occasionalism). Among Muslims, atomism was typically linked with occasionalism, continuous creation and the rejection of natural causality. The Karaites, however, seem to have affirmed a form of natural causality as a corollary of their theory of creation.

Karaite teachings found a receptive audience among eleventh-century Byzantine Jews, some of whom studied in Jerusalem. They produced the earliest Hebrew translations of Arabic speculative writings over a century before the famous translations of the Ibn Tibbon family in Provence. Despite their odd renderings of technical terms and slavish adherence to Arabic syntax, these Hebrew versions, epitomes and anthologies linked later Byzantine Karaites to the earlier tradition. The transmission process culminated in 1148-9 with the completion of Judah Hadassi's *Eshkol ha-Kofer (Cluster of Henna)*, an encyclopedic code in rhymed Hebrew acrostics. Although more original in form than in content, the work notably includes a creed - a mark of Islamic influence - anticipating Maimonides' Thirteen Principles by a decade. Hadassi's ten articles address: (1) God's existence, unity and wisdom; (2) divine eternity and uniqueness; (3) the world's createdness; (4) the revelations to Moses and other Hebrew prophets; (5) the truth of the Torah; (6) the distinctiveness of the Hebrew language; (7) the unique and eternal sanctity of the Temple site; (8) the resurrection of the dead; (9) divine judgment; and (10) reward and punishment. Most of these articles align with positions developed in Kalam treatises like the *al-Kitab al-muhtawi (Comprehensive Treatise)*.

Numerous harsh, anti-sectarian remarks in the writings of twelfth-century Andalusian Rabbanites indicate the spread of Karaism to Islamic Spain. In an autograph letter, Judah Halevi (d. 1141) reveals that he began his *Kuzari* in response to questions from a Karaite. The third part contains an informed attack on Karaite practice and a staunch defence of rabbinic tradition. In *Sefer ha-Kabbalah (The Book of Tradition)*, Abraham Ibn Daud (d. *circa* 1180) chronicles the history of Rabbanite scholarship in order to prove the validity of the Oral Law. In documenting the heresy of Spanish Karaites, he even mentions how Rabbanite Jews were given license to persecute them. The great exegete Abraham Ibn Ezra polemicizes against numerous Karaite legal positions and records his disputations with the sectarians (for example, in commenting on Leviticus 7: 20). While a vigorous Karaite community clearly existed in twelfth-century Spain, neither the names nor works of Spanish Karaites have survived. And although the Andalusian Rabbanites seem to be implacable foes of the sectarians, Ibn Ezra, at least, regularly cites the commentaries of Japheth ben Eli and Yeshu'ah ben Judah in non-polemical contexts; their philological, rationalistic approach clearly appealed to him.

2 The post-Maimonidean phase

Later Byzantine Karaites similarly admired the clarity, erudition and rationalism of Ibn Ezra and Maimonides. Writing in fluent Rabbinic Hebrew, Aaron ben Joseph (d. *circa* 1320) and Aaron ben Elijah of Nicomedia (d. 1369) engage, criticize and frequently borrow from them and other Rabbanite authors. The latter Aaron is remarkable for his trilogy: *'Ets Hayyim (The Tree of Life)*, a theological *summa*; *Gan Eden (The Garden of Eden)*, a code; and *Keter Torah (The Crown of the Law)*, a commentary on the Pentateuch. Modelled on the *Guide to the Perplexed*, *'Ets Hayyim* is the first substantial Karaite work of religious philosophy composed in Hebrew. Its technical vocabulary is largely Tibbonid, although the older Karaite terminology also persists. Like Maimonides, Aaron clearly deems religious philosophy an authentic and original component of Judaism. But while Maimonides hails Aristotelianism as the soundest speculative system, Aaron clings to the *kalam* of his ancestors. Where Maimonides subjects *kalam* theories to rigorous criticism (*Guide to the Perplexed* 1: 73-6), Aaron defends Mu'tazilite teachings or seeks to harmonize them with Aristotelianism - sometimes through terminological sleights of hand. Consequently, *'Ets Hayyim* is more a *kalam* response to Aristotelianism than a Karaite critique of Rabbanism.

During the fifteenth century, Byzantine Karaites and Rabbanites reached an intellectual rapprochement. Increasingly, Karaite disciples incorporated the scholarship of their Rabbanite teachers into their own compositions. However, while Rabbinic writing began to take new turns, Karaite literary activity became increasingly derivative, and though small sectarian communities still flourished (notably in Poland, Lithuania, the Crimea and Egypt), the great age of Karaite intellectual achievement and innovation had effectively come to an end. Today, Karaites in Israel, Europe and the USA face the challenge of establishing their own communal identities as minorities within minorities. The old philosophical problems that exercised their ancestors are all but forgotten.

Karma and rebirth, Indian conceptions of

The combined beliefs in karma and rebirth, that is, the retributive power of actions and decisions and a beginningless, though not necessarily endless, succession of births and deaths for living beings, constitute a fundamental premise of the great majority of India's religious and philosophical traditions. The suggestion first made by the great Muslim scholar al-Biruni (973-1048) that they are the *fundamental creed of Indian religious thought in general may be questionable, but it is certainly understandable. Although such notions are by no means exclusively Indian, they have played a far more central and pervasive role in India than in any other cultural domain.*

In a sense, the idea of karmic retribution postulates that the act itself will hold its originator responsible and accountable. Acts of moral or ritual significance will bring about their own reward or punishment, that is, favourable or unfavourable experiences. On the other hand, favourable or unfavourable experiences and conditions are forms of reward or punishment for past actions and decisions. Karmic retribution takes place through a sequence of countless existences and may involve a movement through a vast variety of forms of life. More specifically, this implies that birth into a particular species, physiological and psychological features, sex, social status, life span, exposure to pleasant or unpleasant experiences, and so on, appear as results of previous actions (usually acts committed in previous lives), and that current actions are expected to have a corresponding influence on future existences. In Sanskrit, the realm of rebirth and karmic retribution is known as saṃsāra. *Its precise scope has been subject to some debate. The most common assumption is that it coincides with sentient existence and includes the entire hierarchy of living organisms from the gods down to the plants. While later Buddhism tends to exclude the plants from this domain, Jainism finds forms of life and sentience even in the elements water, earth, and so forth. Most schools of philosophy view being in* saṃsāra *as a condition of bondage, suffering and alienation; even karmic ascent is ultimately undesirable. The ability to transcend this condition by transforming and eventually eliminating the power of karma is often associated with human existence and considered a rare privilege. Most forms of life are just forms of karmic retribution, without any capacity for karmic initiative.*

The historical origins of the doctrine of karma and rebirth cannot be determined with certainty and precision. While the Vedas and Brāhmaṇas provide significant antecedents, they do not show any clear recognition of the doctrine as such. Even in the older Upaniṣads (prior to 500 BC), its formulations are still tentative, partial and more or less isolated. It seems that the teachings of the Buddha added a new and stricter notion of causality and a far more explicit sense of moral responsibility and universal applicability to the older versions. The other important reform movement of this period, Jainism, showed an early commitment to a systematic elaboration of karmic factors and processes. Unlike the Buddhists, the Jainas developed a reified, even substantialist notion of karma. In Hindu literature, such texts as the great epic the Mahābhārata (beginning around 400 BC) give clear evidence of a fully developed and generally recognized doctrine of karma and rebirth. Subsequently, the doctrine was adopted and variously interpreted by most schools of philosophical and religious thought. It served, moreover, as a basic premise of law texts, popular narratives and mythologies, and a wide array of traditional 'sciences', such as medicine, embryology and astrology. Significant disagreements and debates occurred with regard to the status and character of the karmic agent and the subject of transmigration and rebirth (most conspicuously in connection with the Buddhist denial of a durable 'self' or ātman*). The moral relevance and metaphysical qualities of acts and decisions, the nature of karmic causality and the mechanism of rebirth, the possibility of a transfer of karma, the compatibility of knowledge and action, and the prospects of and problems concerning the elimination of karma and the ultimate transcendence of rebirth provided further topics of debate.*

In its various contexts and applications, the doctrine of karma and saṃsāra *has at least three different yet interrelated functions and dimensions: it is used to provide causal explanations (especially in the realm of life); it serves as a framework for ethical discipline and religious orientation; and it provides the rationale for a fundamental dissatisfaction with worldly existence and a commitment to final liberation from such existence. The ways in which these functions have been balanced or correlated with one another reflect fundamental trends and tensions in the Indian tradition in general.*

1 Terminology

The word ‘karma’, one of the most familiar Indian loan words in colloquial English and other Western languages, is the nominative of the Sanskrit noun *karman*, which is a derivative of the verbal root *kṛ*, ‘to do’, ‘to make’. The literal and primary meanings of *karman* are ‘deed’, ‘work’, ‘action’, ‘act’ (often with ritual connotations), but also ‘object’ in a grammatical sense. The semantic linkage with an inherent retributive power of acts and decisions, or with an accumulation and preservation of their effects, occurs in some Upaniṣads and, much more clearly and explicitly, in early Buddhism (Pāli: *kamma*). A familiar alternative for *karman* in this sense, especially in Hindu literature, is *adṛṣṭa*, ‘unseen’, that is, the ‘invisible’ results of our actions. In closer association with ritual acts, we also find the term *apūrva*. Good karma is often referred to as *dharma* or *puṇya* (‘merit’), bad karma as *adharma* or *pāpa* (‘demerit’, ‘evil’, ‘guilt’). The term *karmavipāka* refers, primarily in Buddhism, to the ‘ripening’ or ‘fruition’ of the karmic potential, while *karmāśaya* refers to the ‘karmic residue’ or the ‘accumulation of karma’.

The English term ‘rebirth’ has its literal equivalent in *punarjanma*, but this does not carry much terminological weight. In the Brāhmaṇas, it is preceded by *punarmṛtyu*, ‘redeath’, ‘recurrent death’, and *punarāvṛtti*, ‘return’ from an otherworldly realm to life on this earth. In Buddhism, which does not recognize a durable self, we find *punabbhava*/*punarbhava*, ‘repeated existence’; more specifically, the Pāli term *paṭisandhi* (Sanskrit: *praṭisaṃdhi*) refers to the causal linkage between successive lives. In the middle Upaniṣads as well as in old Buddhism and Jainism, *saṃsāra*, ‘roaming through’ (successive states or existences), ‘transmigration’, emerges as a fundamental notion. It refers to worldly existence as an aimless recurrence of life and death, and to the world itself as a karmic stage. Karma and rebirth are inseparable in this concept.

As far as English terminology is concerned, it should be noted that ‘rebirth’ is ontologically more neutral than ‘transmigration’, ‘metempsychosis’ or even ‘reincarnation’, which may suggest the existence of a durable entity and would thus seem inappropriate in Buddhism. The common phrase ‘law of karma’ has no terminological equivalent in traditional Indian thought, where there is no use for the modern concept of ‘natural laws’, nor any commitment to their systematic empirical verification. ‘Law of karma’ is not only a terminological innovation, but, in many of its usages, also a conceptual reinterpretation.

2 Sources

References to karma and rebirth are to be found in Indian texts of the most diverse types and genres, from the late Vedic to the modern period. The doctrine appears in popular mythology and philosophical thought as an unquestioned presupposition and a topic of explicit theoretical efforts. But except for Jainism, comprehensive and systematic presentations are rare.

Various suggestions and tentative statements are found in the old Upaniṣads, for instance in Bṛhadāraṇyaka Upaniṣad 6.1- and 4.4, and Chāndogya Upaniṣad 5.1-. The great epic the *Mahābhārata* contains a large number of casual references, but also some relatively systematic and coherent presentations. In the ‘law books’ (Dharmaśāstras), the most coherent and significant survey is provided by the twelfth chapter of the *Manusmṛti*. The Purāṇas and other more popular religious texts add much relevant material (see, for instance, the *Pretakalpa* of the Garuḍa Purāṇa). Among the traditional sciences, the medical texts (Āyurveda) provide the most extensive discussions. Various works compile and summarize older statements on karma and its effects, especially karmic punishments, in the form of digests. Among these, the popular and anonymous *Karmavipākasaṃhitā* and the more scholarly *Madanamahārṇava* (fourteenth century) by Viśveśvara Bhaṭṭa are available in printed editions.

More or less explicitly, the doctrine appears throughout the literature of the classical systems (*darśanas*) of Hindu philosophy; one of the more coherent treatments is found in the Yoga system (see *Yogasūtra* 2.13 with commentaries). Nyāya and Vaiśeṣika add more basic arguments concerning rebirth and the existence of the self. Advaita Vedānta has produced one of the rare philosophical monographs on karma, the *Vijñānadīpikā*, falsely attributed to Śaōkara’s disciple Padmapāda. In a more theological fashion, the numerous schools of ‘sectarian’ (Śaivite and Vaiṣṇava) thought continue the debate.

The basic acceptance of karma and rebirth in Buddhism is obvious in its most ancient documents; its full realization is associated with the enlightenment of the Buddha. However, relatively few texts in the oldest parts of the Theravāda canon, for instance the *Mahā*- and *Cūḷakammavibhaōgasutta* of the Majjhimanikāya, deal with it in a thematic fashion. The Jātaka texts describe the future Buddha’s path through more than five hundred existences. The Abhidhamma/Abhidharma part of the canon produces elaborate conceptual schemes in its analysis of karma

and rebirth. Numerous details were debated among the Buddhist schools and sects; from a Theravāda perspective, these debates are documented in the *Kathāvatthu*. The popular *Milindapañha (Questions of Menander)* pays special attention to reconciling the postulate of personal accountability with the Buddhist 'no-self' doctrine.

For the Sarvāstivāda views on karma, the *Mahāvibhāṣā* and the *Abhidharmakośa* (which also includes Sauntrāntika ideas) are exemplary documents. Vasubandhu's *Karmasiddhiprakaraṇa* combines Sautrāntika and Yogācāra ideas on karma. The spread of Buddhism beyond South Asia also led to a dissemination of the ideas of karma and rebirth. The fact that the basic premises of the doctrine were less familiar in the non-Indian traditions which adopted Buddhism sometimes led to the production of auxiliary or explanatory materials, for instance, the *paralokasiddhi* texts in Tibet, which are supposed to establish the basic facts of rebirth and life after death.

The most elaborate treatises on karma and rebirth are found in Jainism. The oldest extant sources already indicate an extraordinary scholastic commitment to this doctrine. A concise summary of the oldest developments is given in Umāsvāti's *Tattvārthasūtra*, produced around the fourth or fifth centuries CE and accepted as authoritative by the Digambara and Śvetāmbara schools of Jainism. The systematic elaboration of the karma theory continues through a large number of works, including Śivaśarman's *Karmaprakṛti*, the anonymous *Saptatikā*, Candrarṣi's *Pañcasaṃgraha* and a group of nine texts known as Karmagranthas. In addition to the Prakrit and Sanskrit originals of these works, we also find adaptations and commentaries in vernaculars, especially Gujarati.

3 Beginnings and early developments

The absence of any clear evidence for karma and rebirth in the older Vedic documents has led to extensive speculations concerning potential extra-Vedic or 'non-Aryan' origins of the doctrine. The possibility of such origins cannot be excluded. On the other hand, we have no historical documents to support and substantiate it. For the time being, the philologist and historian of ideas will have to work with those materials that *are* available, even if they do not answer the question of the origin, but provide only more or less relevant antecedents and approximations. For this endeavour, it is essential not to presuppose and impose the standards of a unified theory of *saṃsāra*, or of any other kind of systematic theory.

Different ideas about life after death coexist in Vedic thought. Among them we find such beliefs as a reappearance of the dead in the form of animals (birds or snakes), but also as their own descendants or relatives. While this may pave the way for the later concept of rebirth, it does not imply that reappearance or survival after death was taken for granted in Vedic times. Other, less popular, notions suggest that the continuation of existence after death had to be accomplished through specific, primarily ritual, activities and techniques and was by no means accessible to all living beings. Side by side with such ideas we find concepts of cosmic balance and justice (most significantly *ṛta*) which may foreshadow certain aspects of the karma theory.

Against this general Vedic background, some of the oldest Upaniṣads provide us with more specific approximations and anticipations of the later concept of *saṃsāra*. The cyclical explanation of life and death found in the combined doctrines of the 'two paths' and the 'five fires' (Bṛhadāraṇyaka and Chāndogya Upaniṣads) is among the most significant examples. This theory does not assume a direct transition from one living organism to another, but an intermediate residence in a heavenly realm, as determined by the amount of ritual merit accumulated during the preceding lifetime. The cyclical 'way of the fathers' is contrasted with the 'way of the gods', which transcends all cycles, and an enigmatic 'third condition' for creatures without access to the 'two paths' and possibly without any capability of rebirth or permanent survival. Other ancient texts speak of a transfer of ritual merit or 'works' (*karman*) from one person to another, for instance, from a dying father to his son (Kauṣītaki Upaniṣad 2.15). Bṛhadāraṇyaka Upaniṣad 3.2.13 proclaims, in a brief and elusive reference, *karman* as the decisive factor for the continuation of existence after death, but does not give any further details. Other relevant passages suggest various possibilities concerning the nature of acts, their inherent retributive power and the modalities of rebirth. The ritual dimension is supplemented by notions of moral behaviour (such as *caraṇa*; see Chāndogya Upaniṣad 5.10.7) in a wider sense. Concepts of 'desire' (*kāma*) and 'decision' or 'commitment' (*kratu*) appear in some competition with *karman* itself. The identity and nature of the agent, the mechanism of retribution, and the scope and limits of the field of transmigration remain ambiguous. The process is not governed by strict causality; there is always room for chance.

Clearer formulations of what may be called (in the sense of a convenient label) a 'standard version' of karma and

rebirth emerge in the *Mahābhārata* and other texts of the period beginning around 400 BC (for instance, the 'law texts', with their elaborate catalogues of different acts and their karmic compensation). The *Mahābhārata* itself recognizes the two basic postulates which define the 'classical' karma theory: 'deeds' require the appropriate retribution as their effect; and positive or negative experiences and modes of being require a karmic cause. We may assume that the anti-Vedic reform movements of Buddhism and Jainism played a significant role in this consolidation of the doctrine of karma and rebirth.

4 Applications and interpretations in Hindu thought

During the centuries preceding the beginning of the Common Era, the concepts of karma and *saṃsāra* became pervasive, almost universally accepted premises of Indian thought and literature, from religion, philosophy and the traditional sciences to poetry, mythology and popular narratives. Only the materialistic Cārvākas and a few other groups that denied life after death and the moral and retributive implications of actions rejected these concepts (see Materialism, Indian school of). Karma was, moreover, projected into the most ancient layers of the tradition and appeared as the indispensable background and presupposition of the most ancient texts, including the Vedic hymns. Older doctrines and ideas, such as the conceptions of fate (*daiva*) or time (*kāla*) as cosmic powers, were reinterpreted in the light of the karma theory and included in the comprehensive notion of *saṃsāra*. Early developments in some of the philosophical systems (*darśanas*) exemplify and illustrate these general observations.

There is little evidence that karma played any significant role in the cosmology of ancient Sāõkhya, probably the oldest of the classical systems of Hindu philosophy. It was absent from the original conception of the periodic manifestation and unfolding of the basic matter and matrix (*prakṛti*). With the consolidation of the karma theory, the power of deeds and the need for retributive experiences were invoked as a catalyst for the actualization of the cosmic energy of the 'matrix' and thus for the initiation of a new world cycle. However, karma remains insignificant in so far as its ethical and soteriological role is concerned. Actions as such are relegated to the realm of *prakṛti*, that is, to objective 'material' processes. They do not affect the essence of the pure subject or spirit (*puruṣa*). The acting and transmigrating entity itself is a mere product and configuration of *prakṛti* and will ultimately be dissolved in it (see Sāõkhya §§2, 6).

The allied Yoga system of Patañjali offers a more integrated, coherent and explicit explanation of karma and rebirth, which suggests an early interaction with Buddhism. Karma functions within the 'wheel of *saṃsāra*' (*saṃsāracakra*), which is kept in motion by pleasure and pain, desire and aversion, merit and demerit. The production and operation of karma depends on the presence of the five 'afflictions' (*kleśa*); the most fundamental item in this group, which includes desire and aversion, is 'nescience' (*avidyā*), a radical misconception of oneself and the world. As long as this nescience has not been eliminated, the other afflictions will remain in place, and new karma will be produced. As a rule, the karma accumulated during one lifetime will determine the conditions of the immediately following existence, that is, birth in a particular species (*jāti*), life span or 'life-quantum' (*āyus*), and affective potential, or the balance of favourable and unfavourable experiences (*bhoga*). However, this basic rule of 'karmic ripening' (*karmavipāka*) is subject to innumerable qualifications and exceptions, so that the incompatibility with such texts as the *Manusmṛti*, which do not recognize the 'one life' rule at all, may be less severe than it appears.

The treatment of karma and rebirth is somewhat different in Nyāya and Vaiśeṣika. Unlike Sāõkhya and Yoga, both Vaiśeṣika and Nyāya consider the soul or self (*ātman*, *puruṣa*) to be the originator of acts and decisions and, accordingly, as the substrate of karma. In their assessment of the moral quality of acts, they are more committed to the orthodox 'law books' than Sāõkhya and Yoga. Also, they do not advocate the 'one life' rule of karmic ripening.

According to Nyāya, the effects of actions are stored as 'dispositions' (*saṃskāra*) in the soul. Sooner or later, they will initiate the formation of a new organism, which will provide the appropriate karmic retribution. Elaborate arguments are devised to demonstrate the distinctness and immortality of the soul and the indispensability of its stored karma for the explanation of biological and physiological processes. With the general alliance and amalgamation of the two systems, the Nyāya teachings on karma and rebirth were combined with those of Vaiśeṣika and became virtually indistinguishable. However, there are obvious differences in the oldest texts. While old Nyāya shares its use of the term 'karma' with Yoga and Buddhism, Vaiśeṣika prefers *adṛṣṭa* (and assigns a different terminological role to *karman*). *Adṛṣṭa*, the 'unseen' result of our actions, includes 'merit' and 'demerit'

(*dharma* and *adharma*), two of the twenty-four 'qualities' (*guṇa*) that constitute the second ontological category (*padārtha*) of the system. It inheres in the 'souls' or 'selves' (*ātman*), which are conceived as omnipresent spiritual substances. Accordingly, its retributive potential is all-pervasive, and it can influence or direct events anywhere in the world. The preceding exposition follows Praśastapāda's presentation of the Vaiśeṣika system (*c*.500 CE). There are significant and historically symptomatic differences in the older *Vaiśeṣikasūtra*. Here, *adṛṣṭa* is not even listed among the 'qualities' of the soul, and the cosmological role of karma remains generally more ambiguous (see Nyāya-Vaiśeṣika §§4-5, 7).

Because of its commitment to the proto-karmic ritualism of the Brāhmaṇas, the contributions of classical Mīmāṃsāto the karma theory are more limited. However, in its complex and highly technical theory of the Vedic ritual, it offers significant general perspectives concerning the motivation to act, the capacity to act ritually and produce ritual merit (which it restricts, in an exemplary and influential manner, to upper-caste Hindus), the connection between actions and their results, and the formation and structure of complex acts or clusters of action. Kumārila's theory of *apūrva*, the latent power produced by rituals, deserves special attention in this context.

In the school of Advaita Vedānta, as represented by Śaōkara and his followers, the role of karma and rebirth is very significant, but also ambiguous and elusive. On the one hand, Upaniṣadic notions of the recurrence of life and death live on in Advaita Vedānta. On the other hand, later systematic and scholastic views concerning the accumulation and elimination of karma are adopted and developed in a somewhat eclectic fashion. For instance, the division of karma into that which is being accumulated (*sancīyamāna*), that which has been accumulated but may still be neutralized (*sañcita*), and that which has started producing its results (*prārabdha*) is a familiar item. But although karma is a basic premise in Advaita Vedānta, it is ultimately irrelevant. It is confined to the level of conventional, provisional truth (*vyavahāra*). In the end, karma and rebirth have only one meaning and function: to expose the ontological and soteriological deficiency of our world of time and space. Good karma is as vacuous as bad karma. The entire domain of karma and causality is a realm of ignorance and illusion (*avidyā*, *māyā*) and needs to be transcended.

The radical monism and illusionism of Advaita Vedānta was criticized by numerous schools of theistic Vedānta, especially those that flourished among the devotees of Viṣṇu (for instance, Rāmānuja's Viśiṣṭādvaita and Madhva's Dvaita Vedānta). According to these groups, karma was real; but it could be neutralized and superseded through loving devotion to God (*bhakti*) and divine grace, and was thus relegated to a lower level of relevance (see Vedānta §3; Rāmānuja; Madhva). Corresponding materials are found in the rich philosophical and theological traditions of the devotees of Śiva, such as the South Indian Śaiva Siddhānta and the Pratyabhijñāschool of Kashmir.

5 Buddhism

In the oldest extant sources of Buddhism, there is far less ambiguity about karma and rebirth than in the Upaniṣads, not to mention the older Vedic texts. In the legendary accounts of his enlightenment, the Buddha himself (*c*.500 BC) is credited with the discovery of a pervasive causality and with the realization that living beings are causal series of acts and results which extend over countless successive existences. Although the number of older canonical texts which deal with the doctrine in greater detail is relatively small, its central significance cannot be questioned. It is, in fact, inseparable from the quintessential Buddhist formula of 'dependent origination' (*pratītyasamutpāda*; Pāli: *paṭiccasamuppāda*). In the emerging sectarianism, debates on karma play an important role; different conceptions and interpretations of karma are among those factors that define the doctrinal identity of the various schools.

The basic contributions of ancient Buddhism to the development of the karma theory relate, above all, to the following five areas:

1 a stricter notion of causality which postulates a pervasive coherence of karmic events, but insists on the feasibility of choice and responsibility, that is, of acts which are not themselves karmic effects (thus avoiding the karmic determinism associated with the Ājīvika school);
2 a notion of agency which defines the act as rooted in, or even as essentially identical with, volition and decision (*cetanā*) and interprets its vocal or physical implementation as a secondary phenomenon;
3 a process ontology which interprets the connection between act and experienced result strictly and exclusively as

causal continuity and tries to avoid the assumption of an identical subject or substrate of act and result;
4 a comprehensive ethicization which replaces Vedic-Brahmanic notions of ritual correctness and caste-bound aptitude with more open and universal ideas of moral obligation and value;
5 a more radical notion of final liberation (*nirvāṇa*/*nibbāna*) and the commitment to achieve it by eliminating the roots of karmic existence, that is, selfish desire and the illusion of the self.

All these areas leave room for further analysis and debate. What, more precisely, is the nature of the mental act or intention, and how does it relate to speech and physical action? How is karmic causality transmitted, and how does it interact with other causes? Is there an intermediate existence between death and rebirth? How does karma influence the external, material world, and how does it determine the physiological or psychological constitution of sentient beings? What is the special karmic situation of a *buddha* or an *arhat*, whose selfish desire has been eliminated? Such and similar issues are discussed in detail in the Abhidharma texts and the commentarial literature of the Theravāda tradition, and analysed in the context of their complex theories of causal conditions (*pratyaya*/*paccaya*) and the ultimate constituents of reality (*dharma*/*dhamma*). The *Kathāvatthu* defends the Theravāda views against numerous alternatives.

Among the other great schools of Buddhist thought, Sarvāstivāda made significant and influential contributions to the *dharma* theory, the classification of causal factors, and the analysis of the person as a 'series' (*santāna*) of *dharmas*. Its reifying conception of 'acquisition' (*prāpti*) is supposed to explain the way the series is affected by the moral and karmic implications of decisions and actions. It also deals with the relation between mental acts and their vocal and physical manifestations and in general with the question of how latent actions (*avijñapti*) relate to their manifest counterparts (*vijñapti*). To provide a basis for causality and especially for the durable retributive power of acts in an impermanent world, Sarvāstivāda developed its distinctive theory of time, which postulates an irreducible state of non-actual being or subsistence for past and future entities, side by side with the actual existence of present entities (see Buddhism, Ābhidharmika schools of §3).

In the teachings of the Vātsīputrīya-Sāṃmatīya school, we find the peculiar and seemingly 'heterodox' concept of a durable 'person' (*pudgala*), that is, a common basis of act and result. However, this *pudgala* is described, in a somewhat elusive fashion, as neither different from nor identical with the impersonal factors that are supposed to constitute the person. It should not be identified with the Hindu notion of the 'soul' or 'self' (*ātman*).

The Sautrāntika school adds various qualifications to the Sarvāstivāda analysis of volition, action and the transition from the initial impetus to the intended act itself (*cetayitvākarman*). But most significant is its explanation of the process that leads from the act to the retributive result: any intentional act or decision affects the subsequent series of mental events (*cittasantāna*) in a particular fashion and impregnates it with a certain potential. It initiates, in collaboration or competition with other acts, a process of evolution or transformation (*pariṇāma*) within the series which will lead to a mental state of fruition or retribution. It is a kind of mental seed or germ (*bīja*) which is transformed into its appropriate fruit.

The Yogācāra-Vijñānavāda school adopts these and other Sautrāntika ideas and develops them in the context of its 'consciousness only' theory, a subjective idealism which reduces reality to states of awareness or mental occurrences. Reality in this sense, as mental and experienced reality, is *eo ipso* a medium of retribution. As a basis and matrix for the generation of retributive - favourable or unfavourable - experiences, the school postulates a 'warehouse consciousness' (*ālaya-vijñāna*), which contains the potential, or the stored 'seeds', for all actual awareness (*pravṛttivijñāna*) (see Buddhism, Yogācāra school of §§5-8).

The most radical treatment or rather transcendence of karma and rebirth is found in the Mādhyamika school of Nāgārjuna. Here (as centuries later in Śaōkara's Advaita Vedānta), karma and rebirth are relegated to the level of provisional, pragmatic and conventional truth (*saṃvṛti* or *vyavahāra*), to an understanding of oneself and the world which needs to be transcended. Neither the accumulation of good karma nor the attempt to eliminate all karma will lead to *nirvāṇa*. Karma is inseparable from a false commitment to means and ends, to acquisition, ownership and selfhood. From the standpoint of absolute truth, it is as essenceless and 'void' (*śūnya*) as the self or soul (*ātman*) itself. Realizing this voidness is liberation.

In general, the transfer of karmic merit plays a much greater role in the Mahāyāna schools than in old Buddhism; it is a defining characteristic of the *bodhisattva* ideal.

6 Jainism

The ancient movement of Jainism, founded or perhaps reorganized by the Jina Mahāvīra, an older contemporary of the Buddha, is small as far as the number of its followers (3-4 million) is concerned. But in quantity and speculative technicality, its literary contribution to the doctrine of karma and rebirth surpasses those of both Hinduism and Buddhism.

There can be no doubt that some form of the doctrine, probably with a certain degree of technical elaboration, was part of the teachings of the founder himself. However, because of problems of transmission and documentation, it is difficult to determine with precision their nature and contents. We may assume that the following features were present already in the most ancient period of Jaina thought: the conception of karma as a material or quasi-material substance that is attached to the soul (*jīva*) and suppresses its inherent potential; an extremely wide-ranging notion of life and *saṃsāra* which finds souls and the potential for rebirth and retribution not only among humans, animals and plants, but also in such substances as earth and water (though not all souls may have the capacity for final liberation); a strong emphasis on ethical practice and asceticism; a peculiar technical terminology concerning the attraction, accumulation, exclusion and elimination of karmic matter (which was later supplemented, but not replaced by, terms borrowed from the Hindu and Buddhist schools).

A very concise, highly authoritative presentation of the Jaina theory of karma in its developed form is found in Umāsvāti's *Tattvārthasūtra* (perhaps fourth century or even earlier). Numerous later commentaries, digests and systematic treatises, produced by both the Digambara and Śvetāmbara sects, add a vast amount of technical and speculative detail to this version of the doctrine, but they do not question or alter its basic premises. It can be summarized as follows. The basic framework is provided by the division of reality into living and lifeless entities (*jīva* and *ajīva*) and the karmic categories of influx (*āsrava*) of karmic matter into the soul, subsequent bondage (*bandha*), stoppage (*saṃvara*) and expulsion (*nirjarā*) of karma, and final liberation (*mokṣa*). A soul defiled by confusion, passion and selfish desire attracts particles of potentially karmic matter floating in space; and through the 'vibrations' produced by volitional activities, it binds or glues these particles to itself and converts them into actual karma. The activities relate to body, speech or mind, and the 'vibrations' vary accordingly. A soul which is thus associated with karmic matter will inevitably be an embodied soul, and will be unable to extract itself from the cycle of transmigration.

The Jainas pay special attention to preventing the influx of new karmic particles and to expelling karma that has already been accumulated. To achieve these objectives, they invoke a complex set of ethical rules and regulations, which are supplemented by practices of asceticism and meditation. The principle of nonviolence (*ahiṃsā*) constitutes the core of Jaina ethics. Classifications and subdivisions of the types and functions of karma are highly elaborate. Basically, they distinguish 'ruinous' (*ghātin*; Prakrit: *ghāi*), from 'nonruinous' (*aghātin*/*aghāi*) karmas. The first category, which impedes or obscures the internal cognitive and soteriological potential of a soul, comprises 'perception-obscuring', 'knowledge-obscuring', 'affective' (*vedanīya*) and 'confusing' karmas. The second group relates to the conditions and circumstances of a soul's embodiment; it includes those karmas which account for certain basic limitations of the soul's potential, membership of a particular species and physiological setup (*nāman*), social position (*gotra*/*goya*) and life span (*āyus*/*āuya*). Numerous subdivisions and specifications supplement these general categories.

The proliferation of speculative and scholastic details is a most conspicuous feature of the Jaina literature on karma and rebirth. But there are also other developments, such as the tradition of more basic philosophical arguments concerning the existence of the soul (as the condition of the possibility of rebirth) which is affiliated with Jinabhadra's *Viśeṣāvaśyakabhāṣya* (about sixth century). Even more significantly, we also find an orientation which tends to relegate the entire domain of karma and rebirth, and of causal interaction between soul and matter, to a level of conventional and provisional truth which needs to be transcended. The *Samayasāra* of Kundakunda, possibly an older contemporary of Umāsvāti and one of the most authoritative teachers in the Digambara tradition, exemplifies this orientation, which combines a traditional Jaina perspectivism with the Mādhyamika Buddhist notion of 'two truths'.

7 Applications and reinterpretations in modern Indian thought

With the dissemination of Indian ideas beyond South Asia, chiefly through the spread of Buddhism, the doctrine of

karma and rebirth was adopted by such traditions as China, Japan and Tibet and adjusted to various cultural contexts and presuppositions. These developments had no visible repercussions in India itself. Likewise, the encounter with those foreign religions that had their own presence in India and were generally opposed to karma and rebirth, above all Islam and later on Christianity, did not lead to any explicit defence or reconsideration of the doctrine. However, the Indian attitude to the foreign, especially Western, world began to change during the early nineteenth century, which can be described as the beginning of modern Indian thought. Western ideas gained an increasing significance for the Indian self-understanding. Traditional concepts and doctrines were reinterpreted in the light of modern Western thought; quite naturally, this included revisions and transformations in the theory of karma and rebirth. Western interpretations and reinterpretations of karma, for instance those by the theosophists and anthroposophists, contributed to and interacted with these revisions (see Theosophy §2).

Exemplary modernist statements on karma and rebirth may be found in the works of such Neo-Hindu thinkers as Vivekananda (1863-1902), Aurobindo Ghose (1872-1950) and Radhakrishnan (1888-1975). Numerous authors continue the debate in contemporary India, both in English and in Indian vernaculars. The most distinctive features of the modernist interpretation can be described as follows:

1 Karma is, more or less radically, dissociated from the traditional mythological implications of *saṃsāra*, which include heavens, hells and other transempirical realms of existence; rebirth itself is treated as a less essential adjunct of karma.
2 Karma is presented as a fundamentally scientific notion, a comprehensive 'law' and principle of explanation, which supersedes all merely physical causality and regularity.
3 There is a stronger commitment to empirical evidence, to 'case studies', to the collection and analysis of 'reports' and personal claims concerning rebirth; research in this sense is foreign to the traditional treatment of karma and rebirth.
4 The doctrine is associated with modern Western concepts of evolution and progress; the world of karma and rebirth appears not so much as the realm of aimless wandering (*saṃsāra*) which calls for transcendence and ultimate liberation (*mokṣa*), but rather as a sphere of potential self-perfection and spiritual growth.
5 In response to European criticism, any fatalistic implications of karma are strongly and passionately rejected, and its compatibility with action, initiative and social responsibility is emphasized.
6 The notions of 'collective karma', 'group karma' or even 'national karma', which have no place in traditional thought, but seem to be taken for granted in theosophy, emerge in Neo-Hindu thought and discourse, although their uses are somewhat elusive and in some cases merely rhetorical.

Such concepts appear also in modern Buddhism, together with other reinterpretations and transformations of the traditional concepts. An important trend is exemplified by the work of the modern Theravādin M.W.P. de Silva, for whom the theory of karma is primarily a theory of psychological and characterological development, and who de-emphasizes its 'judicial' or retributive implications. Even more radical forms of 'demythologizing' karma and rebirth may be found in modern Japanese Buddhism. In both Buddhism and Hinduism, reinterpretations coexist with more traditional and traditionalistic versions. There has even been a certain resurgence of mythical and esoteric ideas concerning intermediate stages and the like, most conspicuously among Western proponents of Hindu or Buddhist traditions.

8 General and concluding observations

Karma and rebirth are among the most important regulative ideas in the history of Indian thought. But there has never been one identical theory (and certainly no scientific theory) of karma to which a majority of thinkers could have agreed. The expression 'the doctrine of karma and rebirth' is only a convenient label. To be sure, there are certain shared premises - above all, the twin postulates that there should be no undeserved suffering or wellbeing and that no effect of a past deed should be lost. But apart from such rather formal premises (which may be derived from the even more fundamental postulate that justice should be inherent in the universe), there has been a wide variety of interpretations and manifestations and much room for debate. The twin postulates themselves may be applied more or less strictly. In fact, their rigid implementation would hardly be compatible with the element of freedom and initiative which is implied in the notion of karmic action.

Furthermore, the familiar association and correlation of karma and rebirth is itself problematic. While the two

concepts have become virtually inseparable in the idea of *saṃsāra*, their historical roots may, in fact, be quite different. There are also significant conceptual differences between karma and rebirth, and their relation is not a symmetrical one. While karma requires rebirth as the condition of its own inescapability, rebirth does not require karma. It could just be a merely factual continuation of existence, without subjection to retributive justice. In this sense, and in spite of its wide-ranging mythical ramifications, the concept of rebirth would, in principle at least, be more easily compatible with a 'scientific' worldview which understands the universe in terms of facts, not values or judicial standards. A world in which rebirth had a place could still be our 'natural' world, the domain of science, while a world in which karma operated would have to be a structurally different universe. Explanation in such a universe would involve justification in the sense of 'theodicy' or rather 'cosmodicy'.

However, karmic causality does not always imply a judicial order of deeds and corresponding rewards or punishments. There is also an ancient and recurrent tendency to explain the functioning of karma as a natural sequence of mental states and events, a psychological, not retributory or quasi-legal, process which links acts and decisions with the formation of dispositions, instincts, character attributes or other internal modes of being. This may, indeed, be the case in some of the oldest statements on karma, which appear in the Bṛhadāraṇyaka Upaniṣad (3.2.13; 4.4.5). Here, Yājñavalkya does not propose reward and punishment (that is, pleasant and painful experience) as the result of karma, but the formation of a good or bad person. Similar ideas are documented in ancient Buddhism. Most later schools distinguish the formation of dispositions, especially of mental 'defilements' (*kleśa*, *doṣa*, *anuśaya*) such as attachment and hate, from the accumulation of retributive karmic potential (*karmāśaya*). The 'defilements' are often presented as a condition for the perpetuation of karma; in some texts (for instance, Vasubandhu's *Abhidharmakośabhāṣya*), the fundamental disposition of existential craving (*tṛṣṇā*) appears as the cause of rebirth *per se*, while karma is said to regulate its specific circumstances. But there has also been much overlap and ambiguity (for instance, in the Jaina notion of 'ruinous' karmas).

What is an act in a karmically relevant sense? What is the significance of intention? What distinguishes good and bad deeds? How does an act produce its 'unseen' power (*adṛṣṭa*), and what is the ontological status of this power? Who or what acts? What connects the karmic agent and the subject of retribution? What is the scope and nature of karmic causality? How does it affect the mental and the physical realm? How do we know about karma and rebirth? Do we have valid arguments for their existence, or is it a matter of authoritative tradition and superhuman modes of awareness (such as 'yogic perception')? Are there basically different types of karma, and how can they be classified?

Our preceding survey has shown a wide variety of answers to these and similar questions. But this multitude of theoretical answers does not describe the breadth and complexity of the phenomenon in its entirety. In the history of Indian thought and life, karma has functioned at various levels of understanding and interpretation, as an unquestioned presupposition and a topic of theoretical inquiry, in popular mythology and in philosophical thought. In its various contexts and applications, it has at least three clearly separable, but interrelated, functions and dimensions:

1 It provides causal explanations of factual occurrences and correlates the present with the past (for instance, in traditional medical literature).
2 It provides perspectives on and incentives for actions and decisions and correlates the present with the future (most conspicuously in the normative Dharmaśāstra literature).
3 It provides a soteriological point of departure, a view of the causal and temporal world which calls for detachment, transcendence and final liberation.

In the philosophical traditions of Hinduism, Buddhism and Jainism we find all of these meanings of karma. But the third one clearly overshadows the other two, and it accounts for the pervasive sense of soteriological commitment in Indian philosophical thought.

Katharsis

One of the central concepts of Aristotle's Poetics, katharsis *('purgation' or 'purification'; often spelled* catharsis*) defines the goal of the tragic poet: by depiction of human vicissitudes so to provoke the spectators' feelings of pity and fear that such emotions in them are finally purged.*

Aristotle's doctrine of *katharsis* is a response to a familiar problem in aesthetics (see Aristotle §29): why do audiences take pleasure in watching tragedies, with their depictions of terrible crimes and sufferings? Plato, who divided the human psychological system into mutually antagonistic rational and irrational components, had a ready answer: he argued that the irrational impulses enjoyed receiving stimulation and nurture from the opportunity tragedy provided them to indulge themselves in such emotions as pity and fear, which were normally kept under tight rein but which thereby became harder to control. This was one reason Plato felt obliged to exclude the tragic poets from his ideal city (see Plato §14).

Against such an accusation, Aristotle merely implied in a single sentence a defence of poetry in terms of *katharsis*: his definition of tragedy in chapter 6 of his *Poetics* culminates in the words 'by means of pity and fear performing the *katharsis* of emotions of this sort'. Because Aristotle never fully explains or justifies this phrase, the term *katharsis* has proven to be endlessly controversial - and also extremely fruitful for all European literary theory since the Renaissance. Scholars are divided on whether *katharsis* means 'purgation' or 'purification', whether the term is derived from medicine or religion, whose emotions undergo the process described, and whether it is moral or psychological, temporary or permanent. The following reconstruction is necessarily tentative.

According to Aristotle, the ultimate goal of every poet is to produce in the audience a kind of pleasure which is peculiar to the kind of poetry in question; all of the constituents of the poem are means towards that end, though not all contribute to the same degree. The production of the kind of pleasure peculiar to tragedy, involving pity, fear and the *katharsis* of such emotions, is the goal to which all the constitutive elements of a tragedy - above all the structure of its plot - are subordinated. Pity is our reasonable response to the sight of someone's undeserved suffering and fear implies our judgment of a similarity between the sufferer and us such that the same kind of suffering could befall us. To provoke these responses, the tragic poet must deploy the appropriate means: a central hero whose fate interests us strongly, who suffers (hence the better tragedies move from happiness to suffering), who is neither too evil (for then his suffering would not seem undeserved) nor too good (for then we would not consider him similar to us), and whose suffering is the result not of his culpability, nor of the gods or fate, which Aristotle ignores, but of some error of judgment he makes.

For Aristotle, pity and fear are not pleasures, but kinds of pain. If tragedy is to procure pleasure, it cannot do so by 'purifying' or 'refining' emotions such as pity and fear - a purer pain is not a greater pleasure - but only by 'purging' or 'discharging' them. In medicine, normally healthy fluids such as bile or blood can put the body at risk when they exceed a certain level; when this happens, the body restores its endangered equilibrium by a purging of these substances. The sufferings in any tragedy provoke pity and fear. But the best kind of tragedy astonishes its viewers by what Aristotle calls *peripeteia*, a sudden change in the expected outcome such that events turn out otherwise than anticipated but still retain a logical concatenation which we recognize afterwards. This shock enhances the viewers' pity and fear so strongly that these emotions and similar states of disturbance end up discharging themselves; as a result, the viewers are left free of them and are restored to their normal state after having been temporarily upset. They enjoy both the restorative pleasure that derives from liberation from pain and the intellectual pleasure that accompanies their delayed recognition of the logical concatenation of the events of the plot.

On this view of *katharsis*, tragedy does not permanently make us better people, refine our emotions or provide a profound insight into the tragic nature of the human condition. Aristotle is simply countering Plato's attack upon tragedy by agreeing with him that tragedy does provoke pity and fear and that such emotions are indeed unpleasant, but objecting that they are not entirely irrational after all and that the effect of the best tragedies is first to provoke them, then to enhance them, but finally to free us of them.

Kauṭilya (*fl. c.*321-*c.*296 BC)

Kauṭilya is famous as the author of the Arthaśāstra, a political treatise often compared with Machiavelli's The Prince. Although its influence on subsequent political and literary writers is noteworthy, tradition has remained somewhat ambivalent about it, especially because of its seemingly ruthless prescriptions for efficacious government. On a closer reading, however, Kauṭilya is assiduously concerned to secure the welfare and wealth of the citizens of a state under a just government, of which the king, although the sovereign, is just one among seven institutes. Upon the king falls the duty of safeguarding the good of the people in as dharma*-sanctioned a way as possible; the 'rule of the rod', intrigues and stratagems are reserved for combatting internal and external threats.*

Kauṭilya did not leave behind any information about himself, but it is generally believed that he was a minister in the kingdom of Maurya Candragupta, who ascended to power after defeating the Nandas in Magadha country. Since Candragupta promulgated the Gupta Empire *circa* 320 BC, Kauṭilya (which is a nickname; his real name was Cāṇakya) is believed to have lived and written the *Arthaśāstra*, the work for which he is famed, around 321-296 BC. A number of Western scholars have, however, proffered a much later date, closer to the early years of the Common Era or even later.

The *Arthaśāstra* is a comprehensive treatise on statecraft that gives cohesion to the political thinking of Kauṭilya's predecessors. It is tersely written, and organized into fifteen books comprising 150 chapters. Like most classical Indian writings on politics, it is mostly instructional in content and lacks theoretical depth on questions such as the ideal state, the origin of the state, and so on. Kauṭilya gives no arguments to ground his political precepts, or to explain why he makes the pursuit of wealth the principal end. He emphasizes the significance of sensual pleasure (for both king and people), and upholds *dharma* (law) as the beacon of socially ordered conduct; but *mokṣa* (spiritual enlightenment and escape from the material world) warrants no place in the *Arthaśāstra*. Kauṭilya's apparent advocacy of the 'rule of the rod' has traditionally been controversial; nevertheless certain of his important teachings were appropriated by the Dharmaśāstras (for centuries the basic legal/moral canons deferred to in India) and, on a close reading, he is mainly concerned to guarantee the citizens' wellbeing. Kauṭilya's sovereign king is just one of seven institutes of the ideal body politic; the others are the ministers, the territory and its subjects (*janapada*), the fort, the treasury, the rod-bearing army, and strategic allies.

The *Arthaśāstra* creates a secular ethos, but religious life and wisdom are given prominence by the appointment of the *purohita*, a Brahmanical priest-chancellor who is to be consulted by the monarch at every decisive step in the affairs of the state. Kauṭilya also describes laws restricting forms of marriage, the urban location of the major caste-groups, the duties of caste-groups, and inter-caste mixing. But beyond this, he cannot be said to be an advocate for the sort of inward-looking Hindu state that has been a feature of post-independence Indian political thought. To be sure, the idea of a nation-state, loosely federated or unified, or even of a representative democratic state, never took root in pre-modern Indian political thinking.

Kauṭilya is quite conscious of the diversity from ancient days of the Indian regions and accordingly allows for a degree of flexibility in matters of law and justice. The king is expected to attend each morning to pleas and petitions from subjects who may come from all walks of life and from different castes or regions. When meting out justice, the king or the state is not in a position to make laws; rather, the sovereign court's jurisdiction is to negotiate between (1) *dharma*, (2) custom or settled community law, and (3) commercial and personal transactions and written edicts. The king may overrule the latter two sources of law, but he cannot put himself above *dharma*, in accordance with which all disputes and contradictory judgments are to be decided (*Arthaśāstra* 3.1.40-4). This precept entails that the king should maintain detailed codes of law, judge each case on its legal merit and mete out punishment proportionate to the offence, not in whimsical excess. The king's ministers, the *purohita*, the ascetics, the queen and prince, the gods and, above all, *dharma* are a check to any possible deviation. (Note that these are broadly ancillary to the principal institutes: the queen is married to the king; the *purohita*, independently of the ministers, counsels the king; ascetics and leading citizens echo the territory's subjects; the gods are the heavenly guards of the fort and the treasury; and *dharma* is the impersonal rule and codes of transcendental ethics symbolized in the rod.) Kauṭilya is credited with having been among the first to set down codes of law, as distinct from listing desirable prescriptions and customary rules regardless of their moral or philosophical merits.

Kauṭilya accorded an unusually important role to philosophy in the training of the king. He called this art *anvīksīki*, understood as the art of reasoning and learning in traditional disciplines (notably Sāōkhya, Yoga and Lokāyata), alongside the Vedas, economics and politics. The king is expected to maintain a regime of study of this material throughout his life. The study of reasoning is undertaken more for its applications in matters of law than for its employment in speculative philosophy (*tarka*). Despite this positive register for philosophy, Kauṭilya does not employ philosophy *per se* in thinking through moral issues and problems in politics. Perhaps the idealistic tendencies of philosophy in the Upaniṣadic tradition made him cautious about philosophy's true worth in the more realistic pursuits of state-making. A life of detached asceticism is not worthy of the philosopher, whose life of practical activity is accomplished if it culminates in providing further instruments by which the state can ensure the protection, prosperity and sovereign stability of the people; there is no state without happy people.

Following a comprehensive treatment of topics connected with internal administration, Kauṭilya devotes a substantial discussion to foreign policy and diplomacy. The king, through his emissaries and envoys, should maintain harmonious relations with neighbouring kingdoms; however, he should be vigilant and alert to possible threats to his kingdom. To this end he is advised to deploy spies and secret agents disguised as ascetics, who, through magical spells and propaganda can create dissension among neighbouring populations, and eventually insurgency. In case an enemy should prove to be powerful, the king should enlist the help and sanction of other neighbours, in a roulette of diplomacy common in international relations anywhere.

definitive work on the Dharmaśāstras had not been done at the time of writing.)

Kautsky, Karl Johann (1854-1938)

Karl Johann Kautsky became the leading German socialist theoretician at the time of the Second International and the authoritative exponent of 'orthodox Marxism'. He was a close associate of Engels, editor of Die Neue Zeit from 1883 until 1917, and author of numerous political, historical and theoretical works. He clashed with Bernstein in the 'revisionist debate' in the late 1890s and with Lenin during the Russian Revolution.

1 Beginnings

Karl Johann Kautsky was born in Prague. His family moved to Vienna where he went to school (the Benedictines at Melk) and then to university (although he dropped out before finishing his degree). The rise and fall of the Paris Commune helped steer his early romantic radicalism in the direction of socialism. At this time, he also began to take an interest in Darwinist evolutionary theory and in the application of science to the study of human societies (Haeckel and Büchner being particularly influential). In 1875 he joined the nascent Austrian Social Democratic Workers' Party and, over the next few years, he wrote extensively for various socialist papers. His first theoretical work, *Der Einfluss der Volksvermehrung auf den Fortschritt der Geschellschaft untersucht (The Influence of Population Growth on Social Progress)* appeared in 1880.

In 1880 he moved to Zurich where he established contact with Karl Höchberg and Eduard Bernstein and, a year later, with Marx and Engels in London. Indeed, it is from around this time that it would be fair to describe Kautsky as a Marxist. In 1882 he returned to Vienna, where he collaborated with the publisher, Dietz, in founding *Die Neue Zeit*, a journal which established itself as the most influential theoretical organ of the Second International. He was to be its editor until 1917. His editorship, together with his many other published works, established him as the leading Marxist theoretician of his time.

2 The consolidation of Kautsky's position

Broadly speaking, Kautsky endorsed Engels' analysis that, while capitalism was undoubtedly heading for a terminal economic crisis, this crisis would be forestalled by a political crisis in the course of which social democracy would be called upon to seize political power and use it to transform the failing capitalist economy into a socialist order of society. This meant, according to Engels and Kautsky, that social democracy would have to prepare for its forthcoming task by employing all legal means to improve its organizational strength and increase its popular support. Kautsky underpinned this view by emphasizing the determinist aspects of Marx's materialist conception of history. This emphasis was reinforced in the course of a long and bruising controversy (largely in the pages of *Die Neue Zeit*) with the English socialist, Ernest Belfort Bax, during the mid-1890s.

In 1885 Kautsky moved to London where he worked closely with Engels. Marx's materialist conception of history provided the perspective, and the British Museum the resources, for a number of historical studies; notably, *Thomas More und seine Utopie* (*Thomas More and His Utopia*) (1888) and *Die Klassengegensätze von 1789: Zum hundertjähren Gedenktag der Grossen Revolution* (Class Struggles in the Age of the French Revolution) (1889). He was to pursue his historical interests in later years in a series of studies in which he attempted to identify the socialist element in Western civilization, particularly in early Christianity.

In 1890 he moved to Stuttgart and, in the following year, he played a major part in drafting the new programme for the German Social Democratic Party (SPD), subsequently known as the Erfurt Programme. It established the SPD as a party fundamentally Marxist in orientation. Indeed, Kautsky's own analysis and justification of the programme, *Das Erfurter Programm in seinem grundsätzlichen Teil erläutert* (*The Class Struggle: Erfurt Programme*) (1892), played a major role in the propagation of Marxism within the German socialist movement. During the 1890's he continued his activities as editor and publicist with characteristic vigour and growing popular success. His study of 'parliamentarianism' was published in 1893, and his thoughtful critique of the policy pursued (mainly) by Georg von Vollmar and his supporters, *Die Agrarfrage (The Agrarian Question)*, appeared in 1899. However, most of his energy in the later years of the decade were devoted to the 'revisionist debate'.

3 Later controversies

Shortly after the death of Engels in 1895, Eduard Bernstein had launched a campaign urging social democrats to

abandon their revolutionary aspirations and set about achieving socialism by piecemeal parliamentary reform. Kautsky was slow to react. However, at the party conference at Stuttgart in 1898, he came out against Bernstein and, in the following year, engaged Bernstein in a lengthy controversy which culminated with the publication of his *Bernstein und das sozialdemokratische Programm: Ein Anti-Kritik (Bernstein and the Programme of Social Democracy)* (1899b). The effect of all this was to consolidate his position as chief guardian and exponent of what since came to be known as 'orthodox Marxism'. He won the admiration of Lenin and even gained the grudging respect of Rosa Luxemburg. His position at this stage in his career is exemplified in his *Die soziale Revolution (The Social Revolution)* (1902), described by the then Chancellor, Prince Bernhard von Bülow, as 'a Baedeker for the state to come'.

During the turbulent years preceding the First World War, Kautsky developed an increasingly cautious approach to the question of violent revolutionary activity. His ambitious *Ethik und materialische Geschichtsauffasung: Ein Versuch (Ethics and the Materialist Conception of History)* (1906) was an attempt to vindicate a materialist approach to ethics against the arguments of the neo-Kantians. And in his *Der politische Massenstreik (The Political Mass Strike)* (1914) he sought the middle ground between the revolutionary left and the reformist right within the SPD. When war broke out, he maintained his 'centrist' position and tried unsuccessfully to preserve party unity.

The Bolshevik seizure of power in 1917 brought Kautsky once more into the forefront of debate. In his view, a socialist society was one in which all exploitation and oppression had been abolished, and this meant that its political form had to be a full democracy. The Bolshevik regime, he argued, could not be described as democratic and was therefore not, properly speaking, a socialist regime. Furthermore, Russia was a relatively backward agricultural economy with only a small industrial sector. The social and economic preconditions for the establishment of socialism were therefore absent, and the Bolshevik 'revolution' was bound to fail, with disastrous consequences for the socialist movement as a whole. Kautsky embodied these and other thoughts in his *Die Diktatur des Proletariats* (*The Dictatorship of the Proletariat*) (1918). It elicited a furious response from Lenin in his book *Proletarskaia revoliutsiia i renegat Kautskii* (*The Proletarian Revolution and the Renegade Kautsky*) (1918) and provoked a controversy which lasted for several years.

In 1927 Kautsky published his *Die Materialistische Geschichtauffassung (The Materialist Conception of History)* in which he gathered together his thoughts on Marx's basic theory. Many regard it as his major work.

Keckermann, Bartholomew (1571/3-1609)

Calvinist philosopher and theologian, Bartholomew Keckermann wrote textbooks in logic, ethics and metaphysics which were widely read and in which he advanced his notion of a system of knowledge. Like so many of his contemporaries in the late sixteenth and early seventeenth centuries, Keckermann was interested in methodological matters. As professor of philosophy in Danzig, Poland, he implemented a new curriculum intended to give students an encyclopedic education within three years. His proposals had considerable influence on subsequent educators and philosophers, especially in northern Europe.

Born and brought up in Danzig (now Gdansk), Poland in 1571/3, Keckermann was given a strict Calvinist education before studying in Wittenberg, Leipzig and Heidelberg. After receiving his MA in Heidelberg in 1594, he taught philosophy first at Studentenburse Paedagogium and then at Collegium Sapientiae where he acquired the chair of Hebrew in 1600 and received his doctorate of divinity in 1602. His growing reputation resulted in an invitation from the Danzig senate to return to the city's Gymnasium, which he did in 1602. As professor of philosophy in Danzig, Keckermann developed a new educational programme intended to give students an encyclopedic education within three years: the first year was devoted to logic and physics, the second to mathematics and metaphysics, and the third to ethics, economics and politics. Several of his textbooks, which were widely used throughout northern Europe, were published posthumously.

In the sixteenth century many philosophers were engaged in a re-evaluation of the methodological and educational assumptions inherent in the scholastic universities of Europe. Progressive Aristotelians like Jacopo Zabarella re-examined the structure of knowledge and science (see Zabarella, J.), and anti-Aristotelians like Peter Ramus proposed a reformation of scholastic logic (see Ramus, P.). Keckermann drew upon Aristotelian and Ramist ideas in his own methodological proposals. With Zabarella, Keckermann believed that the scholastics' intense occupation with the texts of Aristotle should be diverted to the development of new methods and analytic systems. With Ramus, he thought that the teaching of the liberal arts should be made more systematic so that each 'art' would have a precisely delimited field and method of exposition.

Like many progressive Aristotelians of his day, Keckermann was a critical rather than dogmatic follower of Aristotle. As opposed to what he called the 'textual' Aristotelians, who laboured over every word of the ancient texts without introducing any thought of their own, Keckermann placed himself among the 'methodical' Peripetatics, who were concerned 'to develop absolute Methods and Systems of disciplines from Aristotle's font'. According to Keckermann, methodological Aristotelians like himself (and Zabarella) would first delineate a discipline and then accommodate the text of Aristotle to it.

Keckermann was probably the first philosopher to develop a theory about systems of knowledge, and it was in his writings that the term 'system' acquired its technical sense of a body of knowledge unified by a single idea or principle. His theory emphasized the orderly presentation of doctrine. For each genuine discipline or liberal art, there was a set of precepts and rules which characterized it and through which, if properly ordered, one could gain knowledge. Therefore, when the precepts and rules of a discipline were correctly presented, any student with the requisite skill and practice could master that body of knowledge. To become learned one only needed to master all the disciplines.

Keckermann adapted his theory about systems to all the liberal arts. In his lectures and textbooks, he applied his method to logic, physics, politics, metaphysics, ethics, medicine, jurisprudence, mathematics and theology. As a good 'methodological' Aristotelian, his philosophical proposals relied heavily on the texts of Aristotle and yet went beyond them. For example, *Systema ethicae* (1607), his important and large-scale work on ethics, provides a comprehensive treatment of the major issues in the field and uses Aristotle as its primary source; it also presents its topics in a framework and order different from Aristotle's.

One of the important implications of Keckermann's theory of systems is that, when taken together, they would form a unified whole which would constitute all of knowledge and which could be imparted to students. In the conception of this encyclopedia of the 'arts' Keckermann differed significantly from Aristotle in the role he assigned to metaphysics. For Keckermann metaphysics was no longer an Aristotelian science, but a liberal art

which had the task of attributing to each of the other arts or disciplines its proper domain and place in the encyclopedia. It is also noteworthy that Keckermann placed theology among the liberal arts so that it too became part of the encyclopedia of knowledge.

Kelsen, Hans (1881-1973)

Hans Kelsen was one of the foremost (positivist) legal theorists of the twentieth century. He taught in Vienna, Cologne, Geneva and Paris, and finished his life in America, teaching in Chicago, Harvard and Berkeley. He wrote widely, on legal philosophy, constitutional and international law, and political philosophy. Kelsen is best known for his Pure Theory of Law (Reine Rechtslehre) (1934). This is the basis of a theory which, with many changes, he espoused till he died.

Kelsen wanted to purify the study of law by ridding it of all unnecessary distortion or bias, to produce a science of law that would study what the lawyer did as legal scientist without asking sociological, political, or moral and value questions. He first distinguished legal science from the sociology of law (which asked questions as to what were the causes of law and how it operated in society; see Social theory and law §2). Here Kelsen makes a distinction between normative and causal science. Legal science is a branch of normative science whereas the sociology of law is a branch of natural science concerned with the study of causes. The mode of explanation in natural science, the way in which we make sense of the world, takes the form ‘if A then B will follow’. Normative science tries to make sense of the world in terms of the principle of imputation, ‘if A, then B ought to follow’ (see Norms, legal §3).

What does Kelsen think a legal norm is? Its form is that of a direction to officials to apply a sanction if someone does something that is forbidden. Thus, ‘Thou shalt not kill’ would be a prescription addressed to a judge (a direction to an official) to sentence someone to life imprisonment (to apply a sanction) if they unlawfully kill someone (if they commit a wrong). For Kelsen the norm is the meaning of a natural act and not the natural act itself - it is an act of will. The norm is the product of an interpretation of the act. But this interpretation itself implies a norm and that is why Kelsen calls the norm a scheme of interpretation. What does this mean? I see someone standing in a large hall talking to themselves. However I can also interpret this physical act in the normative world as praying. This is the normative meaning of that particular natural act of talking. That is what that person meant by the act and what I understand by it. We both use ‘a scheme of interpretation’ instantiated here by the norm ‘one ought to ask God for help in living in a dangerous world’ to make sense of the natural act. But this raises a problem. Is the fact that the people standing in the hall interpret the person’s natural act as praying definitive?

For legal science, says Kelsen, it is not. This would be merely the subjective meaning of the act and legal science is interested in the objective meaning of the act. That meaning is one from the point of view both of the individual who receives the direction and of third parties, not only from that of the individual issuing direction. When the policeman waves a car down the meaning of that act is objective because a police official is recognized as having that right by the individuals concerned and third parties. This is so because there is a valid norm, ‘drivers ought to obey policemen’, and the mode of existence of a norm is its validity. The validity or otherwise of a norm of the positive law is to be found by reference to another superior norm. This superior norm will likewise be validated by another, more general, norm. But we do not go up an infinite ladder. We finally get to the historical starting point of norm-creation, the historically first constitution. To know this is valid we have to ask whether the natural acts of, say the first Parliament, can have the objective meaning of law-making behaviour (whether their meaning is that coercive acts ought to be carried out under conditions determined by them). All the original founders are dead so we have to suppose that their activity was some form of law-making behaviour. It is only if we assume this basic norm (the *Grundnorm*) that we can say that the norms created in the system had an objective validity. It is this *Grundnorm* that enables us to recognize all the laws belonging to a particular system. So legal science is concerned with those norms that can be traced back to the *Grundnorm* that is valid because presupposed. These form a legal system that is coterminous with the state.

It is the concept of system that enables Kelsen to differentiate law from other branches of normative science, especially morals. Validity in law depends upon the pedigree of the norm, on being able to trace it back to the *Grundnorm*. Any content whatsoever can be a legal norm as long as it has been constituted in the correct fashion and can be traced up the chain of validation. The content of law is not relevant to its validity for the purpose of legal science. And any content can be a legal norm as long as it is valid. This is not the case with morals (see Law

and morality).

Also the law comprises a ‘dynamic system’ as opposed to the static one of morals. In a moral system the norms are deduced from some *Grundnorm* such as ‘Love thy neighbour’. In a dynamic system the derivation does not quite work like that. The norm is concretized as it goes down the hierarchy. Thus, the Road Traffic Act will end up as the judge fining a particular person for a particular act. The judge’s action will have the meaning of a norm which will be the concretization of the norm made by Parliament and called the Road Traffic Act. The judge creates here an individual norm. Within limits the judge has a choice and the judge’s action is valid because it has been validly authorized by the norm above. This expresses Kelsen’s view that there is always the possibility of choice in the law because the system ultimately depends upon authorized choice. Thus morals and law differ in that they are separate normative systems and that one is static and deducible and the other dynamic and undeducible.

For Kelsen validity comes from the presupposition of the *Grundnorm*. But this presupposition is not made by reason of the efficacy or moral rightness of the *Grundnorm*. The former is a sociological question and the latter a moral question; both are distinct from legal science. According to Kelsen we can presuppose the validity of the *Grundnorm* because the system is by and large effective. But this does not mean that validity is equal to effectiveness. Rather it is saying that the condition for making judgments about validity is effectiveness. This is a fine distinction, as can be seen in revolutionary cases where the *Grundnorm* appears to have been changed. Which legal system is valid? Kelsen’s attempt to postulate this *Grundnorm* as a pure hypothesis, the content of an act of thought, detached from both morals and sociology, has been very controversial and must probably be deemed a creative and interesting failure.

Kemp Smith, Norman (1872-1958)

Norman Kemp Smith is now most widely known for his translation of Kant's Critique of Pure Reason. This was begun in 1913 while Kemp Smith was completing his Commentary on Kant's Critique of Pure Reason which, together with his classic studies on Descartes and Hume, established his reputation as the greatest British philosophical scholar of his day. But he was also an outstanding member of the now forgotten British 'Critical Realist' movement, much respected by A.N. Whitehead, which also included among others Kemp Smith's mentor Robert Adamson, Adamson's English pupil G. Dawes Hicks, James Ward, and his pupil G.F. Stout. Science and scientistic fallacies, psychology, including developmental psychology and the histories of science and philosophy were alike concerns of a group of independent thinkers. Their work was obscured by subsequent English philosophers' lack of attention, and the prevailing false assumption that the work of those antecedent thinkers was dominated comprehensively by views mistakenly attributed to 'Hegel' or 'Idealism'.

1 Life

Born in Dundee in 1872, Norman Smith grew up in Cupar Angus (only in 1910 did he add his wife's maiden name 'Kemp' to his own). He studied at the University of St Andrews, and on graduation in 1894 won a Ferguson scholarship which enabled him to undertake further studies in Germany, Switzerland and France. He became a Teaching Assistant at Glasgow University in 1894, where he was acting Professor of Logic in 1901-2 after Robert Adamson's untimely death. He became Professor of Psychology at Princeton in 1906 and, in 1914, McCosh Professor of Philosophy there. He returned to London in 1915 for war work until 1918, and in 1919 was appointed to the Edinburgh chair of Logic and Metaphysics. He held this position until 1945, the Second World War delaying his retirement and adding the duties of the Moral Philosophy Chair for the period 1941-4.

2 Philosophy and the history of philosophy

Kemp Smith believed that much twentieth-century British philosophy simply rehearses long-refuted views. His view was that advance in philosophy is dependent on dialogue with earlier thinkers, which requires study of their cultural contexts, including the history of science, as well as of philosophy.

While accurate learning and historical insight distinguish his early work, *Studies in the Cartesian Philosophy* (1902), this book was also, for thinkers as diverse as Ryle, Lovejoy and Macmurray, both influential and modernizing. Although Kemp Smith was no Hegelian, he insisted that the criterion of truth is the systematic coherence of mutually related viewpoints *in the light of all appearances*. Hence axioms are illicit in philosophy, and Kemp Smith criticizes Descartes' *Cogito* by showing how it implies untenable doctrines concerning perception and mind-body dualism.

Dedicated as the book Adamson did not live to write, Kemp Smith's *Commentary on Kant's Critique of Pure Reason* (1918) has become a classic. Kemp Smith goes beyond exegesis to critical dialogue. Giving new attention to the first edition of Kant's *Critique*, Kemp Smith's account of this as a patchwork, with parts from the pre-critical phases of Kant's thinking, is much more than a simple completion of Vaihinger's work. Against subsequent tendencies of English analytic philosophy Kemp Smith insists that Kant's terminology retains a provisional character due to its having originated in different contexts. Hence one cannot assume that the same word always bears the same signification, and Kant's work is further contextualized by viewing it as an attempt not at finality but at making an advance towards greater coherence and adequacy.

3 Nature contra 'Naturalism'

Although described in the 1930s as a leading figure in the new 'Realist' philosophy, Kemp Smith characterized his thought as 'Idealist' in his 1919 Inaugural address ('*The Present Situation in Philosophy*'), by contrast with 'Naturalism', not Realism. He later described this position as one which regards ethical and aesthetic (spiritual) valuations as real determining factors in the physical world.

Kemp Smith's 1905 critique of Avenarius' misleadingly named doctrine of *reine Erfahrung* ('*Pure Experience*') relates not to any contemporary prominence of Avenarius' work, but to his having given the most thorough working out of the view that perception and the attainment of truth consist in a direct physical conforming of the

brain to the external world's particularity. In opposition to this view, Kemp Smith argues against all doctrines, including that implied by Bradley's conception of 'feeling', which allege that the brain or mind has access to sheer particularity. According to Kemp Smith, the sciences of anthropology and psychology show that the development of mind, including perception, requires the initial operation of animistic notions, theologies, myths, all of which involve the identification of general patterns; and any development of the mind towards a greater objectivity proceeds by criticism of the mutually contradictory beliefs to which these early operations give rise. Furthermore, Kemp Smith argues, the origin and function of these early operations cannot be accounted for in a physicalist theory such as that of Avenarius; the hypothesis would be of a species programmed with a tendency to self-deception while also capable of desiring and possessing truth. In fact, theologies, myths and so forth are not the sheer obstructions to knowledge Avenarius supposes; they arise from confrontations with practical needs and remain subject to challenge by further practical needs. Avenarius has obscured the truth by imposing a methodology which, by parroting categories from a currently fashionable science, mistakenly fancies itself to be scientific.

Kemp Smith (1923) further develops his position in a response to Whitehead's conception of nature (see Whitehead, A.N. §§3-4). 'Nature' is no mere scheme of abstract physical laws; instead it is of such a complexity that the richness of sense-experience, far from being a mere subjective colouring, manifests only the structures that human practical needs have revealed. Thus 'subjectivism' is rejected as missing the real complexity of reality, and it is affirmed that the routes to insight into reality may be various, with none that can be presumed exhaustive. In his *Prolegomena to an Idealist Theory of Knowledge* (1924) Kemp Smith proceeds by way of a phenomenology of mind as a 'patchwork' which takes account of the problem of illusion and its recognition. 'Intuition' is the capacity which results from the developing mind's transactions with reality and the variously mythical and generalizing schemata that have come into being within the mind's development. It comes into being through the lifetime operation of practical needs and of that gradual getting beyond them which constitutes the capacity for knowledge. Biological evolution and the development of the individual organism have equipped it to deal with 'sensa'. These sensa are the data of the senses, and also elements of the presentations witnessed when, for instance, thinking or dreaming. That actual things are seen, says Kemp Smith, is the result of the operation of 'intuition', as understood above. Thus the particular is not the basis of knowledge but the objective of a complex, lengthy pursuit.

In 'The Nature of Universals' (1927) Kemp Smith criticizes the positions of Bradley and Bosanquet, and also that of his friend G.F. Stout, and advances an account of universals which echoes that of Reid. It is not the white of any existing thing which is the universal (for that cannot be whiteness of another thing). The universal 'white' comes into being by way of contrasts made between different characteristics of things, of characteristics identified by contrast as 'colours'. Universals access reality by representing kinds and characters as these have been identified by way of contrasts, both in one's own experience and in that of others from whom one learns them. Linguistic terms are general too, but for Kemp Smith they differ from universals *qua* logical terms as a result of the different context of investigation in which logical terms arise and are applied. This difference between language and logic is crucial for Kemp Smith's friend and former assistant, John Anderson (see Universals §2).

4 Critique of 'Enlightenment'

Kemp Smith conceives of original sin as human limitedness compounded by delusions of self-sufficiency which ignore the unconscious and unwilled aspects of the development of mind and knowledge. Calvin, he held, was a 'Copernicus of psychology', his theology a pioneering scientific criticism of naive voluntarism. Yet Kemp Smith is also a critic of sophistical relativism. He argues that different viewpoints, such as those of religion, manifest different bases in the development of mind, the different perspectives consequent on different minds addressing a complex reality. In the 1920s Kemp Smith contemplated a book-length study of Romanticism, but this was not written; the critique of 'Enlightenment' in his protégé A.A. Bowman's *Studies in the Philosophy of Religion* (1938), however, follows Kemp Smith in emphasizing the reliance of shallow, optimistic naturalism in ethics on a decontextualized, ahistorical, frame of reference (see Enlightenment, Continental §2; Naturalism in ethics §2).

5 Hume, Descartes and rediscovery

While editing his late close friend F. von Hugel's *The Reality of God* (1927), Kemp Smith seems to have reconceived the project of a critique of Enlightenment, von Hugel's clichéd depiction of Hume as smiling villain being so much at odds with the seriousness and reverence for nature that Kemp Smith traced in 'The Naturalism of

Hume' (1905). Kemp Smith's introduction to what has on occasion been referred to as his 'flawless edition of a flawless work', Hume's *Dialogues on Natural Religion* (1935), identifies the 'delusion' and 'sham' of a famous quote with the ratiocinatory 'Federal' perversion of neo-Calvinist religion on which Hume was raised. Opening a new era in study of that towering figure, *The Philosophy of David Hume* (1941) shows Hume rejecting a Hobbesian self-interest doctrine but also directly criticizing Francis Hutcheson's moral intuitionism and the doctrine of design on which it is founded. Deepening his perspective by reference to continental Hume studies, Kemp Smith refutes the conception of an 'associationist' Hume beloved of the Mills and their followers, and on the same misreading anathema to their adversaries. According to Kemp Smith, Hume's later work is no falling-away from his *Treatise*; Hume had rather abandoned his false hopes for what might be accomplished by associationist theory. His writings from the *Enquiries* onwards represent Hume's initial and abiding project of a comprehensive scientific account of human beings founded on the Newtonian observational approach to 'moral questions'. His abiding merit is in his application of the approach of natural history to the study of man and society, making observations inconsistent with that very crude associationism which has often mistaken him for an ally.

This commitment to comprehensive critical-historical exegesis was for Kemp Smith not a retirement into the 'history of philosophy', but a way of advancing philosophy. In his *New Studies in the Philosophy of Descartes* (1954) Kemp Smith expounds the range of Descartes' interests and the development of his doctrines within the historical contexts which shaped their formulation. Half a century after his early challenge to Descartes' *Cogito*, Kemp Smith reconsiders the fruitful complexities of his views on mind-body dualism and perception, especially in relation to later scientific developments.

In returning to Descartes, Kemp Smith addresses the 'two cultures' problem raised by Alois Riehl, whom Princeton had honoured during Kemp Smith's time there. In his *Der Philosophische Kriticismus* (1876-87), Riehl followed the one-sided emphasis of Kant's immediate successors on literary and humanistic studies and suggested a loss of that close relation to the physical sciences which Kant shared with Descartes, a loss which imperilled subsequent philosophy. Furthermore, Riehl thought that philosophy, by way of reaction, mightequally lose itself in an exclusive pursuit of a scientistic methodology. In response, Kemp Smith maintained that in order to avoid these errors, manifest time and again in the history of philosophy, philosophers need to remain open to the history and context of philosophy, both as a warning and as a source of still unappreciated insights. The history of philosophy is an essential element of the dialogue which is philosophy's continuing project.

List of Works

Smith, N. (1902) *Studies in the Cartesian Philosophy*, London: Macmillan.(Decisive for its critique of the *Cogito*, this discusses Descartes' medieval inheritance and examines his influence on Malebranche, Leibniz, Berkeley and Hume.)

Smith, N. (1905) 'The Naturalism of Hume', *Mind* 14: 149-73, 335-47.(Counters notions of Hume as an impious mischief-maker by reference to an account of Nature which echoes Calvin and foreshadows Wordsworth.)

Smith, N. (1906) 'Avenarius's Philosophy of Pure Experience', *Mind* 15: 13-31, 149-60.(William James declared this paper to have dealt a death-blow to Avenarius' theory.)

Kemp Smith, N. (1918) *A Commentary on Kant's Critique of Pure Reason*, London: Macmillan; 2nd enlarged edn, 1923.(Includes a thorough account of previous commentaries; invaluable resource for explication of Kant's terminology in general.)

Kemp Smith, N. (1919) *The Present Situation in Philosophy*, Edinburgh: Thin; repr. in *The Correspondence of Baron Friedrich von Hugel with Professor Norman Kemp Smith*, New York: Fordham University Press, 1981. (Incidentally valuable in exposing implications of doctrines pretending to be all-comprehendingly scientific. The *Correspondence* sheds light on wider references not represented in Kemp Smith's published work.)

Kemp Smith, N. (1923) 'Whitehead's Philosophy of Nature', *Issues and Tendencies in Contemporary Philosophy*, Berkeley, CA: University of California Publications in Philosophy, 4, 197-224.(Emphasizes the limitation of any theory in relation to the complexity of subject-matter.)

Kemp Smith, N. (1924) *Prolegomena to an Idealist Theory of Knowledge*, London: Macmillan.(Emphasizes the complexity of mind and seriously criticizes pretences of theory to exclusiveness. Apparent simplicities of relations between mind and reality are founded on mental processes of intense complexity.)

Kemp Smith, N. (1927) ‘The Nature of Universals’ *Mind* 36: 137-57, 265-80, 393-422.(Criticizes Bosanquet and Stout, maintaining that universals are abstract terms in debate rather than psychological representations.)

Kemp Smith, N. (1935) *‘Introduction’ to David Hume: Dialogues on Natural Religion*, Edinburgh: Nelson; 2nd augmented edn, 1947.(Draws particular attention to Hume’s restricted definition and limited experience of religion.)

Kemp Smith, N. (1941) *The Philosophy of David Hume*, London: Macmillan.(Notes contemporary references not identified in Hume’s arguments and maintains that Hume’s *Treatise* and *Enquiries* were preparatories to the later historical and political studies.)

(1954) *New Studies in the Philosophy of Descartes: Descartes as Pioneer*, London: Macmillan. (Presents the immense range of Descartes’ scientific studies, insisting on the importance of mind-body dualism in identifying questions liable to be raised by future scientific developments.)

Kemp Smith, N. (1967) *The Credibility of Divine Existence*, ed. A.J.D. Porteous, R.D. MacLennan and G.E. Davie, London: Macmillan.(This is Kemp Smith’s own selection from his papers - including 1905, 1906, 1923, 1927 above - which covers topics such as Locke, Bergson, progressivism in ethics and fear.)

Kepler, Johannes (1571-1630)

Kepler's mathematical analysis of Brahe's observations of the motions of Mars enabled him to formulate the descriptive 'laws' of planetary motion, thus giving heliocentric astronomy an empirical basis far more accurate than it had before. He insisted that astronomy had to discover the causes *of the motions that the laws described, in this way becoming a 'physics of the sky'. In the pursuit of this goal, he formulated the notion of distance-dependent forces between sun and planet, and guessed that gravity could be explained as an attraction between heavy bodies and their home planets, analogous to magnetic action, thus pointing the way for Newton's theory of gravity.*

Kepler was introduced to the work of Copernicus while at the University of Tübingen. In 1596 he completed the *Mysterium cosmographicum*, explaining the spacing and the periods of the planets in the Copernican system along broadly Neoplatonic lines. The orbits of the six planets were to be separated by the five regular polyhedra, and the increase in the planetary periods with distance from the sun would be explained by the diminution of a driving force from the sun. Since all of this was contingent upon the Copernican planetary ordering, the treatise constituted an explicit (if unconventional) defence of that ordering, the first since the *De revolutionibus orbium coelestium* in 1543.

In 1600, the astronomer Tycho Brahe asked Kepler to defend Brahe's work against the criticisms of Nicolaus Ursus (Baer), who dismissed mathematical astronomy generally as no more than convenient fiction. In a short work, the *Apologia pro Tychone contra Ursum* (1600), Kepler drew on the history of astronomy to construct a perceptive analysis of hypothetical reasoning in astronomy. He argued that astronomers must not be content with geometrical description, since two such 'hypotheses' might very well save the phenomena equally well. One could not in that case decide between them on geometrical-empirical grounds. What is needed is a causal analysis, a physics of the motions that explains why they occur as they do. Not published until 1858, the *Apologia* has come to be recognized as one of the more acute contributions to philosophy of science from the seventeenth century.

Kepler succeeded Brahe as imperial mathematician in 1601 and began intensive work aimed at establishing the shape of Mars' orbit. He could not avail himself of the convenient device that both Ptolemy and Copernicus had relied on of using different orbits for the calculation of the planet's longitudes and latitudes. The seemingly irreducible error of $8'$ that resulted would not have been significant were it not for the unprecedented accuracy of Brahe's data. Kepler asked himself what physical causes could make the planet move in its evidently non-circular path. Gilbert's theory of the earth as a vast magnet led him to propose that magnetic forces between the two great magnets, sun and planet, could account for both the varying distance between planet and sun, and the variations in orbital velocity of the planet. Finally, in chapter 58 of the *Astronomia nova* (1609), he announced triumphantly: ' Reasoning from physical principles agreeing with experience, there is no figure left for the orbit of the planet except a perfect ellipse'. His second law, that the planet's radius vector sweeps out equal areas in equal times, is tucked away in the massive book also, but even Kepler himself did not recognize its significance until later.

In 1618, he published the *Harmonice mundi*. Applying the principles of harmony to the universe, he tried to explain the distances and periods of the planets and discovered what would come to be known later as his third law (the squares of the periods of any two planets are proportional to the cubes of their mean distances from the sun). In this work he also attempted to formulate an elaborate theoretical basis for astrology. The zodiac, he asserts, is a projection of the human soul; the positions of the planets at a person's birth mark the soul for the remainder of life. Kepler constructed horoscopes and prognostications throughout his professional career; astrology was an important source of income for him. Yet he also expresses doubt about its claims, warning that it may be a matter of luck when astrological prognostications turn out to be correct.

His next work, the *Epitome astronomiae Copernicanae* (1618-21), was widely influential. It presented the case for Copernican astronomy in textbook fashion, laying out the evidence for the earth's motions and discussing, though not as fully as Galileo would later do, the imperceptibility of shared uniform motion. Much of the work was devoted to the technical geometrical detail required for practical computation of the planetary orbits. But the emphasis of the argument was, as always, on causal reasoning; this time he proposed a swirl of magnetic 'species' that would move planets along in their paths. (Lacking the principle of inertia, he had to find a cause for

continuing onward motion.) But as in his earlier works, he did not confine himself to efficient causes only, and found a motive for Copernicanism in the symbolism of God's Trinitarian relation with the universe, the centre of the universe representing God the Father. He also sought final causes for every major feature of the planetary system, even down to the relative sizes and densities of the planets.

Kepler sought order and harmony in the universe, a conviction that guided him in his successful search for the true orbits of the planets. And it prompted him to see astronomy itself as a causal science and not merely a saving of the phenomena. His assurance that harmonies discoverable by the human mind were embodied in the cosmos derived in the first instance from his theology of creation and Neoplatonic metaphysics. Yet his achievements in astronomy, particularly his unconventional notion of a sun-centred force controlling the movement of the planets, showed the way to a self-contained quasi-mechanistic worldview.

Keynes, John Maynard (1883-1946)

Keynes is best known as an economist but, in the tradition of John Stuart Mill and William Stanley Jevons, he also made significant contributions to inductive logic and the philosophy of science. Keynes' only book explicitly on philosophy, A Treatise on Probability (1921), remains an important classic on the subject. It develops a non-frequentist interpretation of probability as the key to sound judgment and scientific reasoning. His General Theory of Employment, Interest and Money (1936) is the watershed of twentieth-century macroeconomics. While not, strictly speaking, a philosophical work, it nonetheless advances distinct readings of rationality, uncertainty and social justice.

1 Probability and induction

Born in Cambridge, England, Keynes was educated at Eton and Cambridge University where his father Neville lectured on logic and economics. After studying mathematics and economics and working briefly in the India Office, Keynes was elected, in 1908, a fellow of King's College Cambridge. During his twenties and thirties, Keynes undertook an informal study of philosophy in the company of the Cambridge 'Apostles' - G.E. Moore, John McTaggart, Bertrand Russell, Alfred North Whitehead, Frank Ramsey and Ludwig Wittgenstein - from whom he forged his own unique matrix of rationalist and empiricist beliefs. Perhaps the most colourful episode of Keynes' fascinating life was his founding association with the Bloomsbury Group of artists and intellectuals. He also served as an advisor to the British Treasury, most notably on the Treaty of Versailles (1919), which he repudiated, and on the early negotiations for the Bretton Woods Agreement (1946). Keynes' prophetic grasp of the political and economic transformations of his world will undoubtedly be valued for generations to come.

In his *Treatise on Probability* (1921), Keynes sought to draw out the logical foundations of probability and to graft these onto the mathematical calculus of probability. This complemented the logicist programme of Russell and Whitehead, particularly the common aim of grounding knowledge in a limited set of intuitions. Keynes viewed probability as a species of logical inference, as the degree of rational belief about a given proposition which extant knowledge authorizes us to entertain. Propositions are known by direct acquaintance with the world and may be true or false, but probability, as a property of an argument, has no bearing on the question of truth. As more evidence comes to light, the probability might increase in value. It does not, however, approximate truth in the straightforward correspondence sense. For Keynes, 'probability begins and ends with probability'.

Probability is objectively determined in the sense that it is transindividual and thus not a function of personal history. A rational person, such as a magistrate or actuary, will arrive at the correct probability judgment and use this as the guide to right action. Nevertheless, in most areas of life we must be content with a qualitative estimate. A numerical measure is only possible in the case of a set of exclusive and exhaustive equiprobable alternatives, and such cases are the exception rather than the rule. Keynes thereby contracts rather than expands the domain of numerical probability assertions. There are for him four possible options when confronted with a non-deductive argument:

(1) there is no probability;
(2) the probabilities do not all belong to a single set of magnitudes measurable in terms of a common unit;
(3) there are existing measures but they must remain unknown; or
(4) the probabilities can be measured and belong to the same set, and are thus capable of comparison.

As for constructing a scale of probabilities, Keynes grants that the end points of the series, certainty and impossibility $(1, 0)$, always exist and that, if there is a given probability, it will lie between them. But in the majority of cases it is not possible to provide a measure of that probability, let alone compare it to others.

Keynes appreciated statistics for its fact-gathering function but was sceptical about its potential for hypothesis testing. Accordingly, he did not extend the rich linkages between probability and statistics. The theorems of Bernoulli and Laplace were discredited, as was any statistical inference that presupposed a probability distribution.John Venn's frequency interpretation of probability was also misguided, in part because of its ascription of numerical measures, in part because of its contingent character and in part because large and stable samples are difficult to obtain (see Venn, J.). Moreover, the frequency interpretation entails a commitment to

natural kinds and to the belief that probabilities are features of the external world rather than of the human mind. For Keynes, probability is a purely logical relationship between the propositions of an argument. In response to criticisms from Ramsey, Keynes later equivocated on the degree of consensus required for objective probability assertions, but he remained steadfast to his rationalist interpretation.

Laplace and a number of followers endorsed the principle of indifference, which stipulated that, in the case of complete ignorance, the a priori probability of a given proposition would be 1/2. Keynes found this suspect because of its ready ascription of a number to what is, at best, known qualitatively. Furthermore, he recognized that one could always break the class of objects denoted by the predicate term into further subdivisions and thus grant that what were treated as equivalent classes before may now contain a different or an indefinite number of more elementary groupings.

One of Keynes' innovations is a property that he calls the weight of an argument, which measures the absolute amount of knowledge and ignorance respectively. Hence, in the case of gathering more relevant yet unfavourable evidence, one would increase the weight while lowering its probability. One might also have a proposition with a high probability and a low weight. The question Keynes leaves us with is whether or not one should always set out to acquire a high weight. Clearly, there comes a point where it is no longer worthwhile to acquire further information, but what principle will determine this threshold is a matter left unresolved. In his economic analysis of investment, however, Keynes made use of this property in order to highlight the ever-present uncertainty of business forecasting.

A hue of uncertainty is also cast over science in general. Inductive arguments are fundamentally probabilistic and thus do not serve to approximate the ideal state of complete certainty. Moreover, pure induction is for Keynes relatively pointless if the confirming instances do not differ except with respect to their spatiotemporal properties. It is analogical reasoning that matters the most. In order to strengthen a scientific hypothesis, it is important to vary the instances, particularly to increase the negative analogies. We are impressed with Newton's law of universal gravitation because of the variety of circumstances it fulfils rather than the mere number of them. Furthermore, prediction in itself is of no consequence since it is essentially a case of pure induction and plays into a dispositional weakness for the temporal ordering of scientific discoveries. Proper grounds for accepting a hypothesis are built up from objective logical relations as elucidated by the theory of probability.

Previous solutions to the problem of induction, such as J.S. Mill's appeal to the uniformity of nature, are discarded as spurious. Keynes concentrates rather on a probabilistic justification of analogical inference. Our convictions about the existence of other people and about the causal links between beliefs and actions are both ample evidence of the support we hold for analogizing. More importantly, we would only be in a position to draw analogies if the universe was not infinitely varied. A priori, we require a finite probability in favour of the inductive hypothesis that there is an upper limit to the independent variety of the objects that comprise our generalizations. Once we grant this so-called principle of the limitation of independent variety, we find that our experience of the world, rather than diminishing its probability, has in fact increased it. In this respect, Keynes maintains that induction is non-circular, even if it is not fully justified. He has provided a probabilistic argument for a principle that he assumes to have an initial probability.

2 Political economy

Keynes viewed economics as a moral science and unfolded one of the most detailed pictures of human agency since David Hume and Adam Smith. By distinguishing different motives for investment and different capacities to discern the flux of the business cycle, and by recognizing that individual motives and actions are rarely synchronized due to ignorance and uncertainty, he broke with the classical conviction that economies are self-equilibrating. Claiming as his forebears the mercantilist economists of the seventeenth century, he argued that the state alone had the monetary and fiscal means to achieve economic stability. But he stopped short of state socialism. With an eye to preserving individual liberty, Keynes proposed a nation of semi-autonomous bodies serving the public good, on the scale of corporations, universities or the central bank.

Keynes was sanguine that the solution to economic scarcity lay in capital accumulation guided by science, technology and the state. But capitalism as a system, while the most efficient means to this end, is grounded in cupidity and thus is morally reprehensible. Moreover, it tolerates high levels of unemployment and unwarranted

inequalities of wealth. Genuine social justice would be possible only if and when humankind freed itself from its animal passion for money and expanded its ambit of altruism. This, he hoped, would come about gradually, with the euthanasia of the *rentier* class and the redistribution of wealth through sound fiscal policy. It was conceivable to Keynes that within approximately 100 years, citizens of the developed economies would no longer be bound by economic necessity and that such abundance would unleash a new form of human flourishing and morality. Keynes' biographical essays on great minds (1933), and his lifelong devotion to the arts leaves little doubt as to what form these higher goods would take.

MARGARET SCHABAS

List of works

Keynes' early philosophical essays are unpublished, and are housed in the Keynes Papers, King's College, Cambridge University.

Keynes, J.M. (1921) *A Treatise on Probability*, in D. Moggridge and A. Robinson (eds) *The Collected Writings of John Maynard Keynes*, vol. 8, London: Macmillan, and New York: Cambridge University Press, 1971-89. (Keynes' one philosophical treatise. Developed an analysis of probability that complements the logistic programme of Russell and Whitehead.)

Keynes, J.M. (1931) *Essays in Persuasion*, in D. Moggridge and A. Robinson (eds) *The Collected Writings of John Maynard Keynes*, vol. 9, London: Macmillan, and New York: Cambridge University Press, 1971-89. (Keynes as policy advisor on the Treaty of Versailles, the gold standard, free trade and liberal ideals. Also offers a vision of the future in 'Economic Possibilities for our Grandchildren'.)

Keynes, J.M. (1933) *Essays in Biography*, in D. Moggridge and A. Robinson (eds) *The Collected Writings of John Maynard Keynes*, vol. 10, London: Macmillan, and New York: Cambridge University Press, 1971-89.(Keynes the master stylist captures the personalities of Isaac Newton, Stanley Jevons, Frank Ramsey and Winston Churchill, among others.)

Keynes, J.M. (1936) *The General Theory of Employment, Interest and Money*, in D. Moggridge and A. Robinson (eds) *The Collected Writings of John Maynard Keynes*, vol. 7, London: Macmillan, and New York: Cambridge University Press, 1971-89. (The most important treatise on macroeconomics of the twentieth century. Maintained that economies are not self-regulating and require government intervention in periods of high unemployment.)

Kierkegaard, Søren Aabye (1813-55)

Although Kierkegaard's name has come to be chiefly associated with writings on philosophical themes, his various publications covered a wide range that included contributions to literary criticism, discourses on specifically religious topics and forays into polemical journalism. Born in Copenhagen in 1813, he led an outwardly uneventful existence there until his death in 1855. None the less much that he wrote drew upon crises and turning points in his personal life; even his theoretical works often had an autobiographical flavour.

Kierkegaard held that the philosophy of his time, largely owing to the influence of Hegelian idealism, tended to misconstrue the relation of thought to reality, wrongly assimilating the second to the first; in doing so, moreover, it reflected an age in which habits of abstract reflection and passive response had blinded people to their true concerns as self-determining agents ultimately accountable for their own characters and destinies. He sought to counter such trends, exploring different approaches to life with a view to opening his reader's eyes both to where they themselves stood and to possibilities of opting for radical change. He implied that decisions on the latter score lay beyond the scope of general rules, each being essentially a problem for the individual alone; even so, his portrayal of the religious mode of existence presented it as transcending limitations experienced in alternative forms of life. Kierkegaard, himself an impassioned believer, was at the same time crucially concerned to articulate the Christian standpoint in a fashion that salvaged it from recurrent misconceptions. Rejecting all attempts to provide objective justifications or proofs of religious claims, he endorsed a conception of faith that eschewed rational considerations and consisted instead of subjective self-commitment maintained in the face of intellectual uncertainty or paradox. His account was set within a psychological perspective that laid stress upon freedom as an inescapable condition of action and experience. The complex implications he believed this to possess for the interpretation of pervasive human emotions and attitudes were discussed in works that later proved highly influential, particularly for the growth of twentieth-century existentialism. Here, as in other areas of his writing, Kierkegaard made a significant, though delayed, impact upon the course of subsequent thought.

1 Life

Kierkegaard was the youngest son of a prosperous and largely self-made Danish businessman. The father was a deeply religious but exacting and guilt-ridden individual who communicated his feelings of melancholy and anxiety to other members of his family; they certainly left a lasting impression on Kierkegaard's own character and development, causing him later to describe his upbringing as having been 'insane'. It was perhaps largely from a desire to please his father, towards whom he tended to exhibit an ambivalent mixture of love and fear, that at the age of seventeen he enrolled at the University of Copenhagen with the object of taking a degree in theology. Nevertheless, after passing his preliminary examinations he found himself increasingly attracted to other spheres of intellectual interest, particularly those involving developments in contemporary philosophy and literature; at the same time he cultivated a fashionably sophisticated lifestyle, following pursuits sharply at variance with the austere precepts that had been inculcated upon him at home. But in his journals, which he began during his protracted period as a student and continued to keep for the rest of his life, he is already to be found recording a growing dissatisfaction with the wayward mode of existence he had adopted, and the death of his father in 1838 appears finally to have prompted him to return to his academic studies with a view to settling down to a professional career. Thus by July 1840 he had been awarded his degree, and two months later he announced his engagement to marry Regine Olsen, the daughter of a highly placed civil servant. This, however, was not to be.

The story of Kierkegaard's abortive engagement is familiar from his journals, where he provided a detailed account of how he eventually broke off the relationship after an uneasy year during which he harboured regrets about his proposal. While his actual motives for making the final breach are left somewhat obscure, there can be no doubt as to its significance for his later thought and writings, allusions to it - often only lightly disguised - occurring in a variety of his works. In any case it certainly constituted a turning point. Henceforward he withdrew into a bachelor existence; moreover, although by now firmly committed to Christianity, he effectively abandoned any further thought of a clerical career and devoted himself instead to living as a writer on the very comfortable income he had inherited from his father's estate. The initial period of his authorship was in fact remarkably productive. He took less than a year over his master's dissertation *Om Begrebet Ironi (The Concept of Irony)*, successfully submitting it to the university faculty in 1841, and he followed it with a series of books, all issued

under pseudonyms, which were largely concerned with philosophical or psychological aspects of ethical and religious belief. The first, entitled *Enten-Eller (Either/Or)*, came out in two substantial volumes in 1843 and was succeeded later in the same year by *Frygt og Baeven (Fear and Trembling)* and *Gjentagelsen (Repetition)*; in 1844 *Philosophiske Smuler (Philosophical Fragments)* and *Begrebet Angest (The Concept of Anxiety)* appeared, and these in turn were followed by *Stadier paa Livets Vej (Stages on Life's Way)* in 1845 and by *Afsluttende uvidenskabelig Efterskrift (Concluding Unscientific Postscript)* in 1846. Two further pseudonymous works on connected themes, *Sygdommen til Døden (The Sickness unto Death)* and *Indøvelse i Christendom (Training in Christianity)*, were published in 1849 and 1850 respectively.

Although it is the writings listed above that have chiefly attracted the attention of subsequent philosophers and commentators, they by no means exhaust the total of Kierkegaard's literary output during the 1840s. Apart from some critical pieces, he also produced - this time under his own name - a number of directly religious discourses in which he aimed to present the essentials of Christian teaching; thus such works as his *Opbyggelige Taler i forskjellig Aand (Edifying Discourses in Various Spirits)* of 1847 were expressly designed to communicate and illustrate the true nature of the Christian message and the demands it imposed upon the individual. In their uncompromising emphasis on the severity of these requirements, and in their manner of stigmatizing the complacency and 'double-mindedness' imputable to contemporary representatives of the faith they professed to serve, the latter books can be said to foreshadow the standpoint from which, in the culminating phase of his career, he launched a violent assault upon the established Church of Denmark. The occasion for this was the death of the Danish primate, Bishop Mynster, in 1854. Kierkegaard had increasingly come to regard Mynster as exemplifying in his own person many of the shortcomings of the church as a whole, and he was therefore incensed by hearing the dead prelate pronounced instead to have been a 'witness to the truth'. As a result he set out in the following months to denounce the covert worldliness and hypocrisy that permeated the clerical establishment, first through articles in the public press and subsequently in a broadsheet printed at his own expense. The ferocity of his attacks, appearing after a spell when he had published relatively little, caused surprise and some consternation. The controversy they stirred up was, however, abruptly interrupted by Kierkegaard's sudden collapse in October 1855 and his death a few weeks later.

2 The limits of objectivity

In an early entry in his journals, written when he was still a student, Kierkegaard gave vent to the dissatisfaction he felt at the prospect of a life purely devoted to the dispassionate pursuit of knowledge and understanding. 'What good would it do me', he then asked himself, 'if truth stood before me, cold and naked, not caring whether I recognized her or not?' Implicit in this question was an outlook which was to receive mature articulation in much of his subsequent work, being particularly prominent in his criticisms of detached speculation of the kind attributable to those he called 'systematists and objective philosophers'. To be sure, and notwithstanding what has sometimes been supposed, he had no wish to be understood as casting aspersions on the role played by impersonal or disinterested thinking in studies comprising scholarly research or the scientific investigation of nature: such an approach was quite in order when adopted within the limits set by determinate fields of enquiry. But matters were different when philosophical attempts were made to extend it in a manner that purported to transcend all particular viewpoints and interests, this conception of the philosopher's task leading to the construction of metaphysical theories which sought to comprehend every aspect of human thought and experience within the disengaged perspective of objective contemplation. Kierkegaard considered Hegel to be the foremost contemporary representative of the latter ambition, the famous system to which it had given rise being in his opinion fundamentally misconceived.

Kierkegaard's general reaction to what he found unacceptable in the Hegelian theory is in fact crucial to an understanding of his own philosophical position. On his interpretation Hegel's philosophy ultimately rested upon a central error, one that involved the illicit identification of essence and existence, thought and reality. The German writer had endeavoured to exhibit the world, and the place of humanity within the world, in terms of an evolving sequence of logical categories that rendered its overall structure fully intelligible from the impersonal standpoint of pure reason (see Hegel, G.W.F. §§4-8). Kierkegaard disclaimed any desire to dispute the considerable ingenuity of the Hegelian metaphysic when this was regarded simply as an 'experiment in thought'. He insisted, however, that thought was not the same as reality, nor could anything real be validly deduced from it; in particular, it was altogether mistaken to suggest that changes and developments in the sphere of actual existence were assimilable to

dialectical transitions between timeless concepts - it was one thing to construct a self-contained logical or formal system, quite another to entertain the project of producing an existential one. In raising such objections, moreover, he was especially concerned to stress their relevance to Hegel's treatment of specifically human existence. The Hegelian world-picture presupposed the possibility of adopting an absolute, God-like point of view from which everything was seen as contributing to an interlocking and rationally determined totality; as a result, human nature tended to be reduced to a philosophical abstraction, the individual to a representative of the species, and the significance of a particular person's life and actions to their role in forwarding an all-encompassing historical process that overshadowed and transcended them. At the same time, Kierkegaard suggested that the notion of an impersonal 'knowing subject' of the type postulated by thinkers of the Hegelian school was symptomatic of a corresponding inclination to forget that the speculative philosopher was himself an 'existing human being' whose status and situation imposed necessary limits upon his outlook and cognitive credentials. Far from his viewpoint on the world being from nowhere within it, such a philosopher inescapably belongs to it in his capacity as a finite empirical individual who 'sleeps, eats, blows his nose' and who has 'to face the future'.

Although Kierkegaard's attitude to Hegel is most extensively displayed in the polemical references that enliven the pages of his *Concluding Unscientific Postscript*, scattered allusions to the faults and weaknesses of 'the System' also appear in many of his other writings. The number and variety of the contexts in which they occur indicate that he regarded the current vogue of Hegelianism as having more than a purely academic significance, the popularity it enjoyed at once reflecting and helping to promote a contemporary ethos in which what he termed the 'illusions of objectivity' exercised a pervasive and corrupting influence. Thus he conceived the age to be one wherein people had lost a clear sense of their identity as individuals ultimately responsible for their own characters, outlooks and modes of living. Instead it was customary for them to take refuge in the anonymity provided by membership of collective movements or trends and to envisage themselves as being inevitably circumscribed by the social roles they occupied in a manner that absolved them from personal accountability for their pronouncements or actions. In Kierkegaard's view, they had largely forgotten what 'it means for you and me and him, each for himself, to be human beings', succumbing to a 'quantitative dialectic' in which a bemused preoccupation with large-scale historical events and a passive submission to the levelling influence of 'the crowd' took precedence over the vital constituents of human life and experience - 'the inner spirit, the ethical, freedom'.

Confronted by such tendencies, Kierkegaard considered it to be a primary part of his task as a writer to challenge habits of thought that smothered spontaneous feeling and obstructed active commitment. He held that these had had a particularly deleterious effect in the religious sphere; the widespread belief that the fundamental tenets of Christianity could be rationally interpreted and objectively justified within the framework of the Hegelian system was symptomatic of a more general disposition to treat both religion and morality alike in a blandly contemplative spirit that detached them from the contexts of inward conviction and practical engagement to which they essentially belonged. With this in mind it was necessary in the first instance to 'make people aware', bringing home to them the limitations of their present condition and awakening them to the possibility of subjective self-determination and change.

3 Aestheticism and the ethical

Kierkegaard maintained that in his early writings he had aimed to arouse and enlarge the self-understanding of his readers by eschewing abstract instruction and by employing in its place an avowedly therapeutic method he referred to as 'indirect communication'. This meant delineating particular ways of life in a fashion that enabled people to grasp concretely and from within the distinct types of outlook and motivation involved, such a procedure being a characteristically literary or 'poetic' one. Not only were alternative positions imaginatively presented as if in a novel or play; the books in which this was done were attributed to different personages in the shape of pseudonymous authors or editors. He intended thereby to avoid the kind of *ex cathedra* didacticism he associated with standard philosophical texts of his time. Instead he favoured an undogmatic approach in which competing views and attitudes were 'allowed to speak for themselves', it being left to his readers to decide where they stood in relation to these and to make up their own minds about the practical conclusions to be drawn.

Either/Or was the first of Kierkegaard's works to be published under a pseudonym and was a book he later alluded to as clearly exemplifying his use of the above method. It purports to portray two radically dissimilar modes of existence, one characterized as 'aesthetic' and the other as 'ethical'. Both are presented through the medium of

allegedly edited papers or letters, the first set being ascribed to an individual referred to as ‘A’ and the second to an older man who is said to be by profession a judge. Aestheticism as exhibited in A’s loosely related assortment of papers is seen to take on a lively variety of forms and guises; among other things, it is held to find expression in the characters of legendary figures like Don Juan and Faust, and it is also illustrated by an account in diary form of a step-by-step seduction. By contrast, the position of the ethicist is set out in two somewhat prosaic letters which are addressed by the Judge to A and which include detailed critical analyses of the younger man’s motives and psychological prospects.

What did Kierkegaard understand by the categories he distinguished? From the text the aesthetic life emerges as one in which the individual is essentially concerned with exploring means to his own satisfaction and where there is a consequent absence of overall continuity in the course he follows. As has been indicated, however, the picture drawn is complex and multi-faceted. While in general outline it is suggestive of a person in pursuit of transient pleasures rather than following any long-term aim, there are passages where attention is chiefly focused on the aesthetic individual’s dependence upon unpredictable vicissitudes of mood or circumstance, and others again where emphasis is laid on his need to guard against the threats posed by ennui or melancholy. Not unexpectedly, it is the problematic possibilities inherent in A’s lifestyle that the Judge singles out for criticism in his comprehensive survey of the aesthetic position. Whereas the aestheticist typically allows himself to be swayed by what he conceives to be the unalterable constituents of his natural disposition, the ethically orientated individual is prone to look at himself in an altogether different light. Both his motivation and behaviour are responsive to a self-image ‘in likeness to which he has to form himself’, his particular aptitudes and propensities being seen as subject to the control of his will and as capable of being directed to the realization of demanding projects that reflect what he truly aspires to become. It is commitment to such projects which endows the ethical life with a coherence and self-sufficiency that its aesthetic counterpart conspicuously lacks (see Existentialist ethics).

Kierkegaard’s treatment in *Either/Or* of the aesthetic/ethical contrast is frequently thought to echo the Kantian distinction between inclination and duty (see Kantian ethics). But although there may be discernible affinities, there are also significant differences. Thus Kant’s predominantly schematic accounts of sensuous motivation are devoid of both the psychological penetration and the literary sophistication that characterize Kierkegaard’s wide-ranging portrayals of the aesthetic stance. And comparable divergences are apparent in the case of the ethical. Kierkegaard’s judge may be said to follow the German philosopher in highlighting the role of the will, underlining its independence of contingent circumstances and stressing its capacity to manage the sphere of natural inclination in a way that is conformable to the ethical individual’s paramount concerns. Yet while he shares Kant’s belief in and respect for the latter’s autonomy, he differs in not presenting moral requirements in terms of the purely formal prescriptions of practical reason. The self which it is the task of each individual to choose and develop is not an ‘abstract’ but a ‘concrete’ self; it stands in ‘reciprocal relations’ with its actual social and cultural surroundings, things like marriage, having a job and undertaking civic and institutional responsibilities being intrinsic to personal fulfilment in the requisite sense. It is implied, moreover, that such active participation in communal affairs, involving an unconstrained and inward adherence to standards presupposed by a shared form of life, reinforces the contrast already drawn with the unreflective or wayward ‘experimentalism’ typified by certain manifestations of the aesthetic outlook. Thus the Judge insists upon the conceptual exclusion from the ethical of whatever savours of the arbitrary or the merely capricious. At the same time, however, he indicates that this should not be thought of as circumscribing in any fundamental fashion the subjective freedom and independence of the individual. For although moral requirements must of necessity be treated as authoritative, they are not apprehended as deriving from a source ‘foreign to the personality’ but are instead experienced as springing or ‘breaking forth’ from the latter’s essential nature.

Even so, it is arguable that the internal tensions between individualistic and socially conformist strains discernible in the Judge’s representation of the ethical sphere cannot always be easily or satisfactorily resolved. Kierkegaard discussed one context in which they might be said to arise in a critical form when he went on to consider a way of life that constituted an alternative to the possibilities so far portrayed. This stage of existence, transcending the other two, was the religious.

4 The religious consciousness

Central to Kierkegaard’s account of religion is his treatment of the concept of faith, a treatment that throws into

relief the most distinctive features of his philosophical standpoint. There are two main areas in which these manifest themselves and in which it is the crucial inadequacies of human reason, practical as well as theoretical, that are emphasized.

The first concerns limitations in the outlook of accepted morality that make themselves felt at certain levels or junctures of experience and are held to call for what is termed a ‘teleological suspension of the ethical’. The implications of this *prima facie* puzzling notion are explored in *Fear and Trembling*, an intricately wrought study in which Kierkegaard’s pseudonymous author - Johannes *de silentio* - treats as his central theme the biblical story of Abraham and Isaac. Johannes portrays Abraham as being ostensibly called upon to set aside ethical concerns in deference to a higher *telos* or end that altogether transcends them. Such a situation is contrasted with the predicament of what he terms the ‘tragic hero’, the latter being someone who is forced to make a choice between conflicting moral requirements but who in doing so still remains within the bounds of the ethical domain. Thus although the decisions taken there may be at an agonizing cost, the fact that they can none the less be seen to conform to universally recognized norms renders them rationally acceptable to others and capable of gaining their respect. This, however, is not so in the case of Abraham, who, as a solitary ‘knight of faith’, responds to a divine command supposedly addressed to himself alone and having a content - the killing of his own son - that must inevitably strike ordinary thought as being both outrageous and incomprehensible. No attempt is made to soften the paradoxical character of such points. On the contrary, Kierkegaard’s pseudonym sets out to underline, indeed to dramatize, the disturbing nature of the demands which religious faith can impose on the life and conduct of an individual. At the same time, he takes practising churchmen severely to task for paying lip service to a phenomenon whose awesome significance they fail to appreciate, and he also criticizes contemporary theorists of religion for construing an intrinsically transcendent category in terms drawn from social and essentially secular conceptions of ethics. This was not to suggest that from a religious point of view moral standards and principles could in general be abrogated or overruled. It did mean, on the other hand, that within that perspective they took on a radically different aspect, one where they possessed a relative rather than an absolute status and where it was the individual’s own relation to God that was paramount, assuming precedence over all other considerations.

The claim that faith in the religious sense pertains to what exceeds the limits of human rationality and understanding recurs in the two subsequent writings that Kierkegaard referred to as his ‘philosophical works’ - *Philosophical Fragments* and *Concluding Unscientific Postscript*. Here, however, it is discussed within a wider setting and in connection with theoretical questions concerning the proper interpretation of religious assertions. Although once again ascribed to a pseudonym, albeit a different one, both books appeared under Kierkegaard’s imprint as their ‘editor’ and in any case may be taken to have expressed views that were basically his own. Thus in each of them it is made apparent that the author totally rejects the feasibility of trying to provide religious tenets with an objective foundation. The belief that the existence and nature of God could be conclusively established from resources supplied by pure reason might have enjoyed a long philosophical career; none the less it was demonstrably unacceptable, Kierkegaard largely echoing - though in a summary form and without attribution - some of the objections that Kant had levelled against arguments traditionally advanced by theologians and metaphysicians. Nor was he any more receptive to the suggestion that religious claims of a specifically historical character, such as those relating to the doctrines of Christianity, were susceptible to justification on straightforwardly empirical grounds; it was impossible to regard them as representing ordinary historical facts of the sort to which standard appeals to inductive inference and evidence would normally be considered appropriate. As he acknowledged, Lessing and Hamann were thinkers who in different ways had already underlined the problematic issues raised by the latter. But it was perhaps Hume’s contention in his first *Enquiry* that only a ‘miracle in his own person’, subverting all the principles of his understanding, could bring a reasonable individual to embrace the Christian religion which most strikingly foreshadowed Kierkegaard’s approach to the subject. No doubt Hume himself had intended his words to be taken in a strictly ironical sense. Even so, Kierkegaard implied that it was open to believers to look at sceptical asides of the type cited in a different light. For by exposing the vanity of attempts to encompass within its grasp matters that lay beyond the scope of reason, such remarks could be said to provide salutary reminders of what was really at stake. It was not to the spheres of impersonal judgment and dispassionate assent that the religious consciousness rightfully belonged, but on the contrary to those of individual choice and inner commitment.

5 Faith and subjectivity

Kierkegaard was certainly not alone in suggesting that writers who tried to justify religious belief on cognitive grounds were more confused about its true nature than some of their sceptically minded critics and to that extent posed a greater threat to it; indeed, Kant himself had virtually implied as much when he spoke of denying knowledge to make room for faith, as opposed to seeking to give religious convictions a theoretical foundation that could only prove illusory (see Kant, I. §4). The question arose, however, of what positive account should be given of such faith, and here Kierkegaard's position set him apart from many thinkers who shared his negative attitude towards the feasibility of providing objective demonstrations. As he made amply clear, the religion that crucially concerned him was Christianity, and far from playing down the intellectual obstacles this ostensibly presented he went out of his way to stress the particular problems it raised. Both its official representatives and its academic apologists might have entertained the hope of making it rationally acceptable to a believer, but in doing so they showed themselves to be the victims of a fundamental misapprehension. From an objective point of view, neither knowledge nor even understanding was possible here, the proper path of the Christian follower lying in the direction, not of objectivity, but of its opposite. It was only by 'becoming subjective' that the import of Christianity could be grasped and meaningfully appropriated by the individual. Faith, Kierkegaard insisted, 'inheres in subjectivity'; as such it was in essence a matter of single-minded resolve and inward dedication rather than of spectatorial or contemplative detachment, of passion rather than of reflection. That was not to say, though, that it amounted to a primitive or easy option. On the contrary, faith in the sense in question could only be achieved or realized in the course of a person's life at great cost and with the utmost difficulty (see Faith).

To understand what lay behind this claim it is important to recognize that Kierkegaard broadly distinguished between two levels or stages of development at which religious belief manifested itself. In his account of the first of these, in which he specified the criteria that any standpoint must conform to if it was to count as a religious one, he was at pains to emphasize the element of 'objective uncertainty' surrounding assertions about the transcendent, such uncertainty deriving from the absence of rational support previously alluded to. So construed, faith essentially involved personal venture or risk, preserving it being figuratively compared to 'remaining out upon the deep, over seventy thousand fathoms of water'. But to hold fast to a conviction in the face of a lack of objective justification or grounds was not the same as giving assent to something that appeared to be intrinsically contrary to reason, an 'offence' to the understanding itself. And it was in the latter terms that Kierkegaard referred to the Christian conception of the incarnation, this being an 'absolute paradox' that required the believer to 'risk his thought' in embracing its reality. Moreover, it was in the light of such a requirement that the level of faith aspired to in Christianity could be said to constitute 'the highest passion in the sphere of human subjectivity', exceeding other forms of religious belief in virtue of the unique nature of the demands it made upon an individual's mind and outlook.

According to Kierkegaard, the paradox of the incarnation lay in the notion that the eternal or timeless had entered the sphere of finite and temporal existence: this amounted to uniting contradictories in a fashion that meant a 'breach with all thinking'. Such a feature precluded treating it as if it could be vouchsafed by ordinary historical enquiry, and he set aside the scholarly pursuit of biblical research and criticism as altogether irrelevant to what was here at issue; quite apart from the specifically 'approximative' status he assigned to history as a branch of knowledge, the content of the particular 'hypothesis' under consideration defied logic in a way that contravened the principles governing any kind of accredited cognitive discipline. Furthermore, he regarded its paradoxical character as having another crucial consequence, namely, that there was no basis for the common assumption that the contemporary witnesses of what was recorded in the Gospels were in a better position to authenticate the reality of the incarnation than subsequent generations who had only the testimony of others to rely on. To suppose that in the present case the evidence of direct observation was superior to testimony was to fail to see that neither could ever function as more than an 'occasion' for belief of the sort of question. With both, a volitional leap of faith was necessary, one that involved a 'qualitative transition' from the realm of rational thought into that of the intellectually inaccessible or 'absurd'.

Kierkegaard's stress on the gap separating faith from reason, which it could need divine assistance to surmount, was reflected in the controversial account he offered of religious truth; this likewise received a subjective interpretation. Thus in a well-known passage in the *Postscript* he contrasted two distinct ways of conceiving of truth, one treating it as a matter of a belief's corresponding to what it purported to be about and the other as essentially pertaining to the particular manner or spirit in which a belief was held. And it was to the second of

these conceptions that he ostensibly referred when he declared that 'subjectivity is the truth', genuineness of feeling and depth of inner conviction being the decisive criterion from a religious point of view. Admittedly he has sometimes been criticized here for a tendency to shift from construing religious truth along the above lines to doing so in terms of the objective alternative, with the questionable implication that sheer intensity of subjective acceptance was sufficient to authenticate the independent reality of what was believed. But however that may be, it is arguable that in this context - as is often the case elsewhere - his prime concerns were conceptual and phenomenological in character, rather than epistemic or justificatory. Kierkegaard's central aim was to assign Christianity to its proper sphere, freeing it from what he considered to be traditional misconceptions as well as from the falsifying metaphysical theories to which there had more recently been attempts to assimilate it. If that meant confronting what he himself called 'a crucifixion of the understanding', the only appropriate response from the standpoint in question lay in a passionate commitment to the necessarily paradoxical and mysterious content of the Christian religion, together with a complementary resolve to emulate in practice the paradigmatic life of its founder (see Existentialist theology §§1, 2).

6 Psychological themes and influence

Kierkegaard's preoccupation with the category of subjectivity that ran like a continuous thread through his theoretical writings was integrally linked to his conception of human beings as individual and self-determining participants in the 'existential process'. The view that freedom and the possibility of change constituted fundamental conditions of human life and fulfilment was delineated in his so-called 'psychological works', *The Concept of Anxiety* and *The Sickness Unto Death*. In both books the structure of human personality is portrayed in developmental and volitional terms; individuals exist in the mode, not of being, but of becoming, and what they become is something for which they themselves are ultimately responsible. In this connection certain pervasive attitudes and emotions can be seen to possess a special significance, Kierkegaard giving priority of place to a form of anxiety or dread (*Angst*) which differed from sentiments like fear in lacking any determinate object and in being directed instead to 'something that is nothing'. Such a state of mind might manifest itself in a variety of ways, but he made it clear that his fundamental concern was with its relation to the consciousness of freedom. Thus he referred to the particular kind of dizziness, or vertiginous ambivalence between attraction and repulsion, that was liable to afflict us when, in certain circumstances, the realization dawned that there was nothing objective that compelled us to opt for one course of action rather than another; in the last analysis what we did was up to ourselves alone, freedom being said to 'look down into its own possibility' as though into a yawning abyss or void. Kierkegaard believed that the psychological phenomenon so identified had momentous consequences, not least for its bearing on the religious alternatives of sin and salvation. On the one hand, the story of Adam represented a mythical illustration of how the awakened consciousness of freedom could arouse an anxiety whose occurrence in this case was the precursor of sin. On the other hand, however, such an emotion might also arise when there was a possibility of making a qualitative leap, not into sin and alienation from God, but towards the opposite of this, namely, faith and the promise offered by Christianity. But here Kierkegaard reiterates the point that a presentiment of the difficulties and sacrifices entailed made the latter a course which there were strong temptations to resist; it followed that people were only too prone to conceal from themselves their potentialities as free beings, such self-induced obscurity serving as a convenient screen for inaction and a failure to change. Self-deception of this sort in fact formed a component of many of the varieties of spiritual despair which Kierkegaard picked out for analysis, as well as underpinning his diagnosis of some of the broader types of malaise he detected in the social and cultural climate of his time.

In his insistence upon the ultimacy of human freedom and his correlative attention to the devices and strategies whereby people may seek to protect themselves from a recognition of some of its disturbing implications, Kierkegaard anticipated themes that were taken up, albeit much later and often in an explicitly secular setting, by a number of leading twentieth-century writers (see Existentialism). Subjectivity and the primacy of the individual, the 'burden' of freedom, the contrast between authentic and inauthentic modes of existence - these and associated topics became familiar through the works of existentialist philosophers such as Jean-Paul Sartre and Martin Heidegger as well as figuring in the wider field of imaginative literature. Nor were those the only areas in which his ideas eventually made an impact. In the sphere of ethics his emphasis on radical choice indirectly contributed to the growth of non-cognitivist theories of value, while in religion his conception of faith had a profound influence on the development of modern Protestant theology, notwithstanding understandable reservations about

some of his more extreme claims regarding its paradoxical character.

PATRICK GARDINER

List of works

Kierkegaard, S.A. (1962-4) *Samlede Vaerker*, ed. A.B. Drachmann, J.L. Heiberg and H.O. Lange, Copenhagen: Gyldendalske Boghandel, 20 vols.(The definitive edition of Kierkegaard's complete works.)

Kierkegaard, S.A. (1841) *Om Begrebet Ironi*, trans. H.V. Hong and E.H. Hong, *The Concept of Irony*, Princeton, NJ: Princeton University Press, 1989.(Kierkegaard's university dissertation. Though principally concerned with Socratic irony, he also discusses the concept in relation to writers associated with German romanticism.)

Kierkegaard, S.A. (1843a) *Enten-Eller*, trans. H.V. Hong and E.H. Hong, *Either/Or*, Princeton, NJ: Princeton University Press, 1987, 2 vols.(Presents contrasting life-views, one aesthetic and the other ethical, in the form of papers and letters attributed to two imaginary characters.)

Kierkegaard, S.A. (1843b) *Frygt og Baeven* and *Gjentagelsen*, trans. H.V. Hong and E.H. Hong, *Fear and Trembling* and *Repetition*, Princeton, NJ: Princeton University Press, 1983.(Two pseudonymous writings: the first an extended meditation on the implications of the biblical story of Abraham and Isaac; the second a portrayal in fictional form of psychological, ethical and religious issues raised by a problematic love-affair.)

Kierkegaard, S.A. (1844) *Philosophiske Smuler*, trans. H.V. Hong and E.H. Hong, *Philosophical Fragments*, Princeton, NJ: Princeton University Press, 1985.(A concise and complex study in which idealist and rationalist approaches to truth are contrasted with ones fundamental to Christian belief.)

Kierkegaard, S.A. (1844) *Begrebet Angest*, trans. R. Thomte and A.B. Anderson, *The Concept of Anxiety*, Princeton, NJ: Princeton University Press, 1980.(An analysis of a pervasive attitude of mind (*Angst*) chiefly evoked by an awareness of human freedom and of possibilities involving radical choice.)

Kierkegaard, S.A. (1845) *Stadier paa Livets Vej*, trans. H.V. Hong and E.H. Hong, *Stages on Life's Way*, Princeton, NJ: Princeton University Press, 1988.(The stages in the title are identified as aesthetic, ethical and religious, Kierkegaard's treatment of the last of these drawing indirectly but graphically on his own life and experience.)

Kierkegaard, S.A. (1846) *Afsluttende uvidenskabelig Efterskrift*, trans. D.F. Swenson, L.M. Swenson and W. Lowrie, *Concluding Unscientific Postscript*, Princeton, NJ: Princeton University Press, 1941.(The book most central to an understanding of Kierkegaard's philosophical position, both in its critique of objective or speculative approaches to religion and in its correlative stress on the irreducibly subjective character of authentic religious faith.)

Kierkegaard, S.A. (1849) *Sygdommen til Døden*, trans. H.V. Hong and E.H. Hong, *The Sickness Unto Death*, Princeton, NJ: Princeton University Press, 1980.(Contains intricate accounts of various forms of spiritual malaise seen as reflecting specific failures in individual self-development.)

Kierkegaard, S.A. (1850) *Indøvelse i Christendom*, trans. W. Lowrie, *Training in Christianity*, Princeton, NJ: Princeton University Press, 1944.(Kierkegaard's final pseudonymous work. Strongly critical of contemporary interpretations of Christianity, it anticipates the uncompromising virulence of his open attacks on the clerical establishment in the last year of his life.)

Kierkegaard, S.A. (1967-78) *Journals and Papers*, trans. H.V. Hong and E.H. Hong, Bloomington, IN: Indiana University Press, 7 vols.(A comprehensive and scholarly edition in English of assorted writings unpublished in Kierkegaard's lifetime.)

Kilvington, Richard (d. 1361)

Richard Kilvington, an English philosopher and theologian, was born near the beginning of the fourteenth cantury and died in 1361. His academic career in Oxford (1320-38) was followed by diplomatic service and an ecclesiastical career that culminated in his serving as dean of St Paul's Cathedral, London. His known works (besides a couple of sermons) are commentaries or 'questions' (philosophical inquiries) regarding three works by Aristotle, a commentary on the Sentences of Peter Lombard (a standard academic requirement for theologians in the later Middle Ages) and the Sophismata. Only his Sophismata has been edited, translated and studied. An ordered collection of philosophical puzzles designed to raise and settle issues in natural philosophy and epistemology, it is one of the earliest and subtlest contributions to the literature associated with the Oxford Calculators.

Judging from his *Sophismata*, Kilvington's other works are very likely to be ingenious, with some importance for the history of philosophy and of science. However, because they survive only in medieval manuscripts and have not been studied since the Middle Ages, our present appraisal of him as a philosopher is confined to that one work.

Kilvington's *Sophismata* was written in Oxford in the early 1320s. Like other medieval works with that title, it grew out of disputations *de sophismatibus*, which had an established place in the fourteenth-century curricula of the universities of Oxford and Paris. A sophisma is a sentence puzzling simply as it stands or on the basis of some hypothesis, designed to bring some abstract issue into sharper focus - the medieval ancestor of 'The present king of France is bald', or 'The morning star is the evening star'. Medieval university disputations based on sophismata were designed to advance a student's training in logic even when the sophisma sentences presented issues in other subject matter. Thus although the first forty-four of Kilvington's forty-eight sophismata are especially concerned with problems regarding change, motive power, velocity or strength, his analysis of the puzzles is always conceptual rather than mathematical; and his solutions, though they often seem to be preparing the ground for a mathematical approach, are always found by applications of logic rather than by calculations. His interest is in *the logic of* change, velocity, knowing and doubting, or any other of the topics investigated in this treatise.

In dealing with his topics chosen from natural philosophy and epistemology, Kilvington employs almost all the devices of fourteenth-century logic, occasionally criticizing their standard use. In each of his sophismata he generates an apparent paradox by presenting what he takes to be at least plausible arguments for both sides of a contradiction, after which he undertakes to resolve the paradox. Opposition and resolution are familiar features of the standard scholastic method, in which the opposition is patently substantive, presenting immediately understandable disagreement over recognizable issues. In Kilvington's use of the method, however, the substantive issues are almost always masked by the (frequently fantastic) examples around which he develops them; as in Sophisma 16, which focuses on the Aristotelian analysis of a sphere's traversal of a proportionally divided plane in order to ask whether the dominant continuist account of space and time violates the principle of non-contradiction. Kilvington clearly intends to make quite general theoretical points about important issues via this oblique approach, although he often leaves it to the reader to recognize that those points have been made.

Kilvington seems to have arrived in Oxford soon after William of Ockham left in 1317. Ockham's teachings had generated strong opposition in the university even before its chancellor, John Lutterell, had charged him with heresy, and it seems very unlikely that Kilvington could have been unaffected by Ockham's views and the official reaction to them. In the *Sophismata* there is no explicit reference to any philosopher besides Aristotle, but the orthodox Aristotelian positions Kilvington takes there regarding physical and epistemological problems suggest that he may be counted among those who rejected Ockhamism.

Kilvington was personally associated with Thomas Bradwardine and Walter Burley. Bradwardine and Kilvington (and perhaps Burley in some of his later writings) constituted the first academic generation of the Oxford Calculators (see Oxford Calculators). William Heytesbury, the most prominent member of the second generation, seems to have been one of Kilvington's students and to have written his own *Regulae solvendi sophismata (Rules for Solving Sophsimata)* with Kilvington's *Sophismata* uppermost in his mind. Toward the end of his life Kilvington, with his friend Richard FitzRalph, played a prominent role in the anti-mendicant controversy.

NORMAN KRETZMANN

List of works

Of Kilvington's works, only the *Sophismata* has been edited; the other works exist in medieval manuscripts, identified in the introduction of the translation and commentary on the edition. Like most other unedited medieval treatises, these last four works are variously titled in the manuscripts.

Richard Kilvington (1321-6) *Sophismata*, ed. N. Kretzmann and B.E. Kretzmann, *The Sophismata of Richard Kilvington*, Oxford: Oxford University Press for the British Academy, 1990.(The critical edition of the Latin text, with an index. A translation is also available in N. Kretzmann and B.E. Kretzmann, *The Sophismata of Richard Kilvington: Introduction, Translation and Commentary*, Cambridge: Cambridge University Press, 1990.)

Richard Kilvington (1324-6) Questions on Aristotle's *On Generation and Corruption*. (Questions on Aristotle; exists in manuscript form only.)

Richard Kilvington (1324-6) Commentary on Aristotle's *Physics*. (Questions on Aristotle; exists in manuscript form only.)

Richard Kilvington (1324-6) Questions on Aristotle's *Nicomachean Ethics*. (Questions on Aristotle; exists in manuscript form only.)

Richard Kilvington (*c*.1333) Commentary on Peter Lombard's *Sentences*. (Sometimes titled *Quaestiones theologicae*, this work is confined to just a few of Lombard's topics.)

This chapter puts Kilvington's work on obligational disputation into its historical context.)

Kilwardby, Robert (d. 1279)

Robert Kilwardby is one of the most remarkable thinkers of the thirteenth century. He is the champion of the traditional approach to philosophy and theology, which developed the body of doctrines worked out by Augustine. His activity is set in the very crucial period of middle scholasticism, when the diffusion of Aristotle's philosophical system and its utilization for Christian theology caused a sharp conflict between the followers of the Patristic tradition, such as Kilwardby or the members of the Franciscan school, and the new theologians, such as Thomas Aquinas, who tried to express the contents of divine revelation within the Aristotelian paradigm. Kilwardby used all of his intellectual resources and ecclesiastical authority in fighting against this new trend and in defending Augustinianism, whose main theses (for example, a plurality of substantial forms in composite substances, the presence of seminal reasons in matter, universal hylomorphism, individuation by matter and form, a conceptual distinction between the soul and its faculties, and the necessity of divine illumination in order to grasp the eternal truths) he supports in his writings.

1 Life and works

The English Dominican Robert Kilwardby was a master of arts in the University of Paris during the years 1237-45, and later a student and master of theology at Blackfriars, Oxford. Prior Provincial of the English Dominicans in 1261, he became Archbishop of Canterbury in 1272 and a cardinal in 1278. He died in the papal service at Viterbo on 10 September 1279.

No listing of Kilwardby's writings and the surviving manuscripts is wholly satisfactory, since in many instances works have been attributed to him on insufficient grounds and their attribution has not yet been the subject of critical study. It is known that while he was teaching in the Faculty of Arts in Paris, Kilwardby wrote a set of *Sophismata grammaticalia* and *Sophismata logicalia*, and commentaries on *Priscianus minor* (Books 17 and 18 of Priscian's *Institutiones grammaticae*; the commentary on *Priscianus maior* is spurious), *De accentibus* and *Barbarismus Donati*, covering syntax, prosody, solecism and figurative speech (see Language, medieval theories of). In addition, he commented on seven works of Aristotle: *Categories*, *Perihermeneias*, *Prior* and *Posterior Analytics*, *Topics*, *Sophistical Refutations* and the first three books of the *Nicomachean Ethics* (the only ones available in Latin around 1240; Kilwardby is perhaps the earliest Latin commentator whose name can be firmly attached to an exposition of that text). His impressive series of commentaries concludes with works on Porphyry's *Isagōgē*, Boethius' *Liber divisionum* and the anonymous *Liber sex principiorum* (see Porphyry; Boethius, A.M.S.).

At Oxford around 1250, Kilwardby wrote the *De ortu scientiarum (On the Origin of Sciences)*, a classification of sciences, which is intended to be a general introduction to philosophy. His questions on the *Sentences* of Peter Lombard, probably connected with teaching at Blackfriars, was written perhaps around 1256. Around 1256-61 Kilwardby produced the treatises *De natura relationis (On Relation)*, *De tempore (On Time)* and *De spiritu fantastico (On Imagination)*.

To these works must be added two *epistulae*, the *Responsio de 43 quaestionibus Iohannis Vercellensis (Response to the 43 Questions of John of Vercelli)* and the *Epistula ad Petrum de Confleto (Letter to Peter Conflans)*. In these, Kilwardby states his position on many important issues concerning physics and ontology and clarifies his attitude towards Aristotle. The *Responsio* is Kilwardby's reply to the questions asked by John of Vercelli, Master of the Dominicans, of himself, Thomas Aquinas and Albert the Great on a number of physical and metaphysical topics that were then widely discussed. The letter to Peter Conflans is connected with the Oxford condemnation of 18 March 1277, which was begun at the instigation of Kilwardby himself. Many of the thirty condemned theses were peculiar to Thomistic thought, such as those concerning the merely potential nature of matter and the unicity of the substantial form. Peter Conflans, Archbishop of Corinth, had written a letter to Kilwardby in defence of the Thomistic theories. Kilwardby's response enables us to measure the distance and appreciate the conflict between the Augustinianism in Kilwardby's system and Aquinas's Aristotelianism, the two main philosophical trends of middle scholasticism (see Aristotelianism, medieval; Augustinianism).

2 Grammar and logic

Kilwardby's logico-linguistic theories are among the most important pre-modistic medieval accomplishments. According to him the disciplines of the *trivium* (grammar, logic and rhetoric) fall outside the Aristotelian division of speculative philosophy into physics, mathematics and metaphysics. They are concerned with signs rather than realities, and they constitute the most convenient introduction to philosophy, teaching the skills of correct speech, writing and reasoning. Grammar comes first, since it deals with the understanding and expression of ideas; then logic, which provides all sciences with a method and is corrective of the reasoning of other disciplines; and finally rhetoric, which serves ethics but is not subordinate to it. Rhetoric is a part of civic studies, because the rhetorician's aim is to devise reasoning appropriate for settling questions arising in civil disputes.

In his commentary on the *Categories*, Kilwardby states that the main difference between grammar and logic consists in the different points of view from which they look at language. The grammarian starts with the utterance and goes on to the thought; the logician starts with the thought and ends with the utterance. So the intentions or concepts that characterize grammar are applied to signs, while those characteristic of logic are applied to the essences of things. As a consequence, logic is concerned not only with speech and reasoning, but also with reality itself. However, the logician's treatment of reality is not that of the metaphysician, who studies the primary classes of being as parts of being. The logician, on the other hand, studies them in regard to their function as predicates or subjects in sentences. Consequently, logic is intended to be the theory of mental discourse concerning being and is therefore ontologically grounded in a correspondence between the structural connections in thought and the framework of reality (see Logic, medieval).

In the commentary on the *Perihermeneias*, Kilwardby specifies his theory of meaning. Like every other physical entity, a word (*dictio*) is composed of matter (the utterance, *vox*) and form. What gives a word its form is the act of signifying, which makes it a *significant* utterance, with its meanings as accidental qualifications. Meaning is impressed on the word as a whole. It depends on the mind, which can abstract the common features of individuals and thus produce a conceptual likeness of what is thought about. It is just this conceptual likeness which is conveyed to another person through utterance, while the sign itself is what affects the hearer's perception and evokes thought (see Language, Medieval Theories of).

3 Metaphysics

Kilwardby's metaphysical doctrine is very different from those that many other authors of his time drew from Aristotle's system. He is faithful to Augustine's thought, even if some understanding of the Aristotelian metaphysics of being is reflected in his theory when, for example, he distinguishes between *ens* (being) and *esse* (existing) and considers *esse* as the act of *ens* (see Existence). Furthermore, he maintains that from a metaphysical point of view the term 'being' is analogically predicated of everything. Therefore, he can regard the categories as classes of being, excluding a narrowly linguistic study of them.

Regarding universals and individuals, Kilwardby adopts a moderate realism in which the Platonist view is preserved for the divine ideas (exemplars of universals in the created order) and individuals are conceived of as their instantiations. This reconciliation of Plato and Aristotle includes a continuing existence of the likeness of the universal in the divine mind even when all the instantiating individuals have perished. However, in addition to this primary existence in the divine mind, universals have a substantial reality in their individuals. Kilwardby argues that if universals were not real (*in re*), our knowledge of the world would be empty, since knowledge is of the universal (see Realism and antirealism; Universals).

Kilwardby denies that the universal *in re* is numerically one in all its individuals. In his commentary on the *Sentences*, he proposes a modal unity based on an agreement in essence of all individuals of one type. (Thus, utilizing Boethian terminology, he maintains that the universal is that *by* which something is (*quo est*), rather than that which is (*quod est*)). This agreement in essence is considered either according to its concreteness - the existence it has in the many - or according to its essence in abstraction, as a construct of our mind. Taken in the first way, the universal form, despite its essential unity, has an existence that differs according to the different matter of the numerically distinct individuals, like the many images of one thing in the fragments of a splintered mirror. Taken in the second way, the form most properly has the status of a universal, that is, something common shared as a whole by a multiplicity of objects.

Since real universals rather than singulars properly correspond to the ideas in the divine mind, how can individuals

be obtained from such forms? In his commentary on Porphyry's *Isagōgē*, Kilwardby answers that it is the material aspect of substance that is the cause of individuation, so that the individual is constituted by its substantial components - form and matter - rather than by its properties, as Porphyry had thought. In his later questions on the *Sentences*, Kilwardby claims that the intrinsic causes of individuation are the form - which plays the active role in designating the matter as that of this or that individual and consequently designating itself as the form of the individual - and the matter, which plays the passive role of being designated as the individual's matter by receiving the form. The language of 'designation' (*signatio*), which had not been used in Kilwardby's earlier treatment of this topic, stems from Avicenna (see Ibn Sina); the influence of Bonaventure's *Sentences* commentary has also been suggested (see Bonaventure).

Between the *Isagōgē* commentary and the questions on the *Sentences*, Kilwardby's thought underwent a development in which more stress is placed on the role of form in individuation, and in which the aspects under which matter and form are to be considered as belonging to a particular individual are specified more exactly. Even in Kilwardby's later treatment of individuation, however, there is still no preoccupation with quantity and dimensions, which already feature in Aquinas' *Sentences* commentary.

Nor is this the only important difference between Kilwardby's ontology and that of Aquinas. It is clear even from an early work such as the *Isagōgē* commentary that he holds that there is some kind of materiality in angelic intelligences, thus adopting the doctrine of universal hylomorphism that he defends in his *epistulae*.

Another important difference lies in the notion of matter. According to Aquinas, who follows Aristotle, prime matter is pure potentiality; Kilwardby, following Augustine, maintains on the contrary that there are active powers in matter. Matter 'strives' for form, such a powerful appetite is an action, and there is no action without a form which performs it. Therefore active powers, or seminal reasons, must be present in matter as a kind of germinal existence of the fully actualized creatures, containing the principles of their subsequent development.

As a further consequence of the rule that there is no action without a form which performs it, there must be a plurality of substantial forms in a composite substance. Thus Kilwardby denies the unity of the substantial form and admits that even the human soul is not simple but is compounded of essentially different parts. On the other hand, he recognizes only a conceptual distinction between the rational soul and its faculties (see Soul, nature and immortality of the).

4 Ethics

Kilwardby's moral system is based on an accurate definition of the proper domain of ethics - human goods which belong to this life and are subject to rational inquiry and civic studies - and is aimed at a reconciliation of Aristotle and Augustine.

The achievement of the highest earthly human good constitutes the first step towards reaching blessedness. There are not two ends of human existence in keeping with the created/uncreated distinction, but a single highest uncreated good in God, to which human happiness is subordinated. He defines the happiness which is the end of civic studies as an act of the rational practical soul consisting in perfect studious activities or the best and most pleasurable perfections of the soul. This is the only kind of happiness Aristotle knew. Whether the soul or the whole human being is happy after death is not settled by Aristotle. In the *De ortu scientiarum*, Kilwardby draws a distinction between the happiness which most philosophers call *felicitas* and the one which Catholics call *beatitudo*. He draws a corresponding distinction between Aristotle's saying that there is happiness in completely virtuous activity and Augustine's claim that there is no possibility of being fully happy in this life without the beatific vision. According to Kilwardby, Aristotle is speaking of habitual (moral) and not theological virtues, and the philosophers who follow him give a diminished but not false account of virtue, since habitual virtue is a large part of virtue in this life, contributing further to the disposition to a more perfect life.

Knowledge and justification, coherence theory of

Coherence theories of justification represent one main alternative to foundationalist *theories of justification. If, as has usually been thought, possessing epistemic justification is one necessary condition (along with truth and perhaps others) for a belief to constitute knowledge, then a coherence theory of justification would also provide the basis for a coherence theory of knowledge. While some proponents of coherence theories have restricted the scope of the theory to empirical justification, others have applied it to all varieties of epistemic justification. (There are also coherence theories of meaning and of truth, as well as coherence theories of ethical or moral justification.)*

The initial contrast between coherence theories and foundationalist theories arises in the context of the epistemic regress problem. *It is obvious that the justification of some beliefs derives from their inferential relations to other, putatively justified beliefs, and that the justification of these other beliefs may depend on inferential relations to still further beliefs, and so on, so that a potential regress of epistemic justification looms, with scepticism as the threatened outcome. The foundationalist solution to this problem is that one arrives sooner or later at basic or foundational beliefs: beliefs that are epistemically justified, but whose justification does not derive from inferential relations to any further beliefs and so brings the regress to an end. The defining tenet of a coherence theory of justification is the rejection of this foundationalist solution, the coherentist insisting that any belief (of the kinds to which the theory is applied) depends for its justification on inferential relations to other beliefs and eventually to the overall system of beliefs held by the believer in question. According to the coherentist, the justification of this system of beliefs is logically prior to that of its component beliefs and derives ultimately from the* coherence *of the system, where coherence is a matter of how tightly unified or interconnected the system is by virtue of inferential connections (including explanatory connections) between its members.*

Contrary to what this might seem to suggest, coherence theories do not deny that sensory observation or perception plays an important role in justification. What they deny is that this role should be construed in a foundationalist way, insisting instead that the justification of observational beliefs ultimately derives also from considerations of coherence. Specific coherence theories may also add other requirements for justification, thereby departing from a pure coherentism, while still avoiding foundationalism.

While the idea of a coherence theory has often played the role of a dialectical foil, developed theories of this kind are relatively rare and are often in serious disagreement among themselves. In this way, coherentism is much less a unified view with standard, generally accepted features, than is foundationalism.

1 History

In contrast to foundationalism, the coherence theory of justification is a relatively recent innovation in the history of philosophy. Although it is possible, albeit with some strain, to construe Spinoza and Kant as advocating versions of coherentism, the first relatively clear-cut coherentist positions are those of the late nineteenth and early twentieth century absolute idealists, especially F.H. Bradley (1914) and Bernard Bosanquet (1920) (see Bradley, F.H.; Bosanquet, B.). Unfortunately, however, the views of these philosophers are marked by a pervasive failure to distinguish epistemological and metaphysical issues, making it hard to separate their coherence theories of justification from their distinct, though related, advocacy of coherence theories of the nature of truth. (A more recent version of essentially the same position, in which this distinction is clearly drawn, is found in the work of Brand Blanshard (1939).)

Coherentism was also advocated in the 1930s by some of the logical positivists, mainly Otto Neurath (1933) and Carl Hempel (1934), in response to the foundationalist views of Moritz Schlick (1934) (see Neurath, O.; Hempel, C.G.; Schlick, F.A.M.). Neurath identifies coherence with mere logical consistency; he also, while retaining something like a justificatory appeal to observation, in effect identifies observational beliefs solely by reference to their content. He thus has no apparent response to what is perhaps the most central and obvious objection to coherence theories: that there will always be indefinitely many different coherent systems between which a coherence theory will provide no basis for a reasoned choice (see further below). Hempel avoids this problem to some extent by simply identifying observational beliefs as those beliefs with the right sort of content that are accepted by ‘the scientists of our culture circle’, but is able to offer no real rationale for such an identification. He

also, like the idealists, fails to distinguish in any clear way between a coherence theory of justification and a coherentist account of the nature of truth.

More recent coherentist positions, in contrast, generally repudiate the coherence theory of truth entirely and are more explicitly and narrowly epistemological in their character and motivation. The main arguments offered in their favour almost always derive from perceived objections to foundationalism, perhaps the central one being the charge that the foundationalist can account for the status of the allegedly basic or foundational beliefs as genuinely justified (in the sense of there being some reason or basis for thinking them to be true) only by appealing to justificatory premises of some sort and so destroying the status of such beliefs as foundational (see Foundationalism). Thus coherentists insist that there is no way to appeal for justification to anything outside of one’s system of beliefs because any such supposed source of justification would have to be apprehended by the person in question in a belief or belief-like state before it could play any justificatory role, and then it would be the belief rather than the external item that was the immediate source of justification.

As this suggests, coherentist positions are virtually always internalist rather than externalist in character, in that they insist that the basis for epistemic justification must be cognitively accessible to the believer in question; while an externalist version of coherentism is theoretically possible, it would have little philosophical point, since a foundationalist view would be vastly more straightforward if externalism were otherwise acceptable (see Internalism and externalism in epistemology).

These recent coherentist views differ from each other in a wide variety of ways, and often seem to have little in common beyond their rejection of foundationalism and their invocation in some fashion of the idea of coherence (and indeed there is often room for doubt in a particular case about how thoroughgoing the former of these two aspects really is). Coherentism is one ingredient, though never developed in a fully systematic way, in the comprehensive and difficult philosophical system of Wilfrid Sellars (1963) (see Sellars, W.S.). The epistemological position of W.V. Quine is also frequently described as coherentist in character, though other features of Quine’s position, especially his claim that epistemology should be naturalized (reduced to psychology), make it difficult to decide whether his view is genuinely a version of coherentism, as opposed to a qualified version of foundationalism (see Naturalized epistemology). More overtly coherentist positions have been advocated by Gilbert Harman (1973) (influenced especially by Quine), Nicholas Rescher (1973, 1974, 1977), Keith Lehrer (1974, 1990), and Laurence BonJour (1985) (influenced especially by Sellars).

As the foregoing suggests, coherence theories first arise as dialectical alternatives to foundationalism, rather than as views that are claimed to be initially plausible on their own. Their defence and elaboration must confront a number of standard problems and objections, with which any such view must seemingly deal in some fashion, and it is around these that the present entry is organized.

2 The regress problem and non-linear justification

The first standard problem arises from the epistemic regress problem itself. If foundationalism is repudiated (and if a genuinely infinite regress of justification is also rejected as psychologically impossible and in any case tantamount to scepticism), then the only remaining possibility for the outcome of the initial regress of epistemic justification seems to be a circle in which the chains of justification eventually loop back upon themselves. Incautious advocates of coherentism have sometimes seemed to endorse the idea that such a result is acceptable if only the circles are ‘large enough’. But the obvious objection to circular chains of justification, to which the size of the circle seems irrelevant, is that they involve circular reasoning and hence have no genuine justificatory force. This is essentially the reason that foundationalists give for rejecting the coherentist alternative and taking the regress problem to constitute a decisive argument for foundationalism.

Perhaps the most standard coherentist response to this issue, stemming originally from Bosanquet (1920), is to reject the idea, implicit in most presentations of the regress problem, that relations of justification must involve a linear, asymmetrical order of dependence among the beliefs in question. They insist instead that justification, when properly understood, is ultimately holistic and non-linear in character, with all of the beliefs in the system standing in relations of mutual support, but none being epistemically prior to the others. In this way, it is alleged, any true circularity is avoided. Such a view amounts to making the system itself the primary unit of justification, with its component beliefs being justified only derivatively, by virtue of their membership in an appropriate sort of system.

And the property of the system, in virtue of which it is justified, is of course specified as coherence.

3 The concept of coherence

But what exactly is coherence? A second obvious problem for a coherence theory is to explicate and clarify this central concept. Intuitively, coherence is a matter of how the beliefs in a system of beliefs fit together or dovetail with each other, so as to constitute one unified, organized, and tightly structured whole. And it is clear that this fitting together depends on a wide variety of logical, inferential and explanatory relations among the components of the system. But spelling out the details of this idea, particularly in a way that would allow unproblematic assessments of comparative coherence, turns out to be extremely difficult, in part at least because of its obvious dependence on more specific and still unsettled topics, such as induction, confirmation, probability and explanation.

The strongest and most demanding conception of coherence, advocated by the idealists, specifies a coherent system of beliefs as one in which each member entails and is entailed by all of the others. It seems clear, however, that this strong conception is both unrealizable by any actual system of beliefs imaginable and also of dubious cognitive value, since it would seem to make all of the beliefs but one redundant and dispensable. (These problems may be mitigated somewhat, though certainly not eliminated, by remembering that the idealists have a quite broad conception of entailment, one in which, for example, relations of nomological necessity are regarded as a kind of entailment).

At the opposite extreme, it seems equally mistaken to follow Schlick (1934) and some others in identifying coherence with mere logical consistency, since the beliefs of a logically consistent system might be entirely unrelated to each other, thus yielding no real degree of mutual support and no apparent reason for thinking that any of them are true. Somewhat more surprisingly, it also seems to be a mistake to make complete logical consistency even an absolutely *necessary* condition for any degree of coherence, as many coherentists have done. In light of such things as the preface paradox and general human fallibility, this would probably mean that few if any actual systems of belief are coherent to any degree at all, a result that seems unacceptably paradoxical (see Paradoxes, epistemic).

If there is a tenable conception of coherence along these general lines, it must seemingly fall somewhere between the two extremes just discussed. Coherence will be a matter of degree, with logical consistency being a highly relevant but not absolute criterion. Coherence will also require a high degree of inferential interconnectedness in the system, involving relations of necessitation, both strictly logical and otherwise, together with probabilistic connections of various kinds. An important aspect of this is what might be called probabilistic consistency, that is, the absence of relations between beliefs in the system in virtue of which some are highly unlikely to be true in relation to others. A further important ingredient of coherence that is much emphasized in recent discussions is the presence of explanatory relations among the components of the system, thus reducing the degree to which the beliefs of the system portray unexplained anomalies. (If ‘inference to the best explanation’ is accepted as one species of inference, then such explanatory relations can be viewed as a kind of inferential relation - see Inference to the best explanation.) Indeed, some positions such as that of Harman (1973), and perhaps also Sellars (1963), go so far as to virtually identify coherence with the presence of such explanatory relations.

The foregoing is an approximate account of the historically standard conception of coherence. While some proponents of coherentism have employed essentially this conception, others have in effect devised more idiosyncratic conceptions of coherence, conceptions whose connection to the historical concept is often quite tenuous. In particular, Rescher (1973, 1977) in fact employs both the standard conception of coherence, for certain purposes, and also a quite different concept that involves forming maximally consistent subsets of initially conflicting ‘data’ or ‘truth-candidates’, and then choosing among these subsets in a variety of ways that involve no appeal to standard coherence. And Lehrer (1974, 1990) has offered two subtly different versions of a general view that defines coherence in relation to the believer’s own subjective conception of probability or relative likelihood of truth; for a belief to cohere with the person’s system of beliefs is roughly for it to be judged to be more probable or more reasonable than any relevant competitor.

The precise nature of coherence remains a largely unsolved problem. It is important to see, however, that difficulties in this area cannot yield anything like a decisive argument against coherence theories and in favour of

their foundationalist rivals. This is so because the concept of coherence, or something so similar to it as to be capable of playing essentially the same role, is also an indispensable ingredient in virtually all foundationalist theories: coherence must seemingly be invoked to account for the relation between the basic or foundational beliefs and other non-foundational or 'superstructure' beliefs, in virtue of which the latter are justified in relation to the former. For this reason, giving an adequate account of coherence should not be regarded as exclusively or even primarily the responsibility of coherentists, despite the central role that the concept plays in their position.

4 Coherence and observation

As mentioned above, few if any coherentists have wished to deny the seemingly obvious fact that sensory observation or perception plays a crucial role in justification (although they have not always been fully explicit on this point). It is thus incumbent on a coherence theory to explain how such observation can be construed in a non-foundationalist way. The central idea is that a belief that is produced by the senses, rather than being arrived at inferentially, might still depend for its justification on coherence with the background system of beliefs. But it is crucial here that the justification in question should still depend also in some way on the fact that the belief was a result of perception, since justification that depended only on the coherence of the belief's propositional content with the rest of the cognitive system would make the observational status of the belief irrelevant.

One way to develop this idea is to focus on the fact that observational or perceptual beliefs are *cognitively spontaneous*; they simply strike the observer in an involuntary, coercive, non-inferential way, rather than as a product of any sort of inference or other discursive process, whether explicit or implicit. That a belief has this status, however, says nothing so far, according to the coherentist, about whether or how it is justified. Indeed, there is no reason to think that all cognitively spontaneous beliefs *are* justified, or even necessarily that most of them are, since the category would include hunches and irrational spontaneous convictions, as well as beliefs resulting from perception. But suppose that, as seems to be the case with most ordinary systems of belief, the system includes a belief to the effect that specific kinds of cognitively spontaneous beliefs (identified by their general subject matter, by their apparent mode of sensory production as reflected in the content of the belief, and by concomitant factors of various kinds) are, under specified (or perhaps 'normal') conditions, highly likely to be true. It then becomes possible to give a justifying reason for such a belief that appeals to its status as cognitively spontaneous and putatively observational, but still does so in a way that depends on the coherence with the background system of beliefs of the claim that a belief of this kind and produced in this way is true. Such a belief would be arrived at non-inferentially, but still justified by appeal to inference relations and coherence. (This view of observation is most explicit in BonJour (1985), but something like it seems implicit in Blanshard's (1939) talk of 'beliefs about the technique of acquiring beliefs', in Sellars's (1963) talk of 'language-entry transitions', in Quine's talk of the 'observational periphery' of the 'web of belief', in Rescher's (1973, 1974, 1977) idea of 'data', and in Lehrer's (1974, 1990) discussion of a person's trustworthiness in acquiring certain kinds of information).

The foregoing provides at best only the beginning of a coherentist account of observation, leaving various problems to be solved that can only be touched on here. First, the other beliefs needed to give a justifying reason for a particular observational belief must themselves be justified in some fashion, without relapsing at this point into foundationalism. These beliefs will include at least (1) beliefs about the conditions; (2) the general belief about the reliability of the kind of cognitively spontaneous belief in question; and (3) beliefs about the occurrence of that particular belief, including the belief that it was indeed cognitively spontaneous. The justification for (1) will presumably have to include other observational beliefs, themselves justified in the same general fashion, so that any case of justified observation will normally or perhaps always involve a set of mutually supporting observations. The justification for (2) will appeal inductively to other cases of correct observation, as judged from within the system, as well as to more theoretical reasons for thinking that beliefs of the kind in question are generally produced in a reliable way. The justification for (3) will appeal to introspective beliefs, themselves constituting a species of observation, and ultimately to the believer's comprehensive grasp of their overall system of beliefs - a grasp whose status poses one of the main problems to be considered below.

Second, it is not enough for the justification of an observational belief that a reason of the foregoing sort should merely be present in a person's system of beliefs, since such an individual might completely fail to notice that this was so, and might hold the belief on some other basis or for no reason at all. Thus even though the observational belief is not arrived at by inference, the availability of the inferential justification in question, even if never

explicitly rehearsed, must be the reason why the believer continues to accept the belief and to appeal to it for further purposes. A full account of coherentist observation would have to spell out exactly what this requirement amounts to and how it can be satisfied.

Third, the bare possibility of coherentist observation seems insufficient to accommodate the role that observation plays in our cognitive lives. Given the convictions that observation is not only possible but pervasive and that an appeal to observational evidence, whether direct or indirect, is essential for the justification of at least contingent beliefs about the world, an intuitively adequate coherence theory must somehow *require* and not just allow that a substantial observational element should be present in any justified system that includes such contingent beliefs. A view that insisted on such a requirement would thereby depart from a pure coherence theory, but might still avoid foundationalism if the coherentist account of observation is otherwise successful. (Such a requirement is relevant to several of the objections examined below.)

5 The standard objections

In considering objections to coherence theories, we may begin with the three that are historically most standard and familiar. The first of these is what is commonly referred to as 'the isolation problem' or 'the input objection': an account of justification that appeals entirely to coherence within a system of beliefs seems to have the consequence that the justificatory status of the beliefs in the system will not depend in any way on the relation of the system to the world that it purports to describe, or on any sort of information derived from that world. This would seem to mean in turn that the truth of the component beliefs, if they happened to be true, could only be an accident, and thus that there is no reason to think that they are true and so no epistemic justification. The coherentist account of observation sketched above, if it can be successfully fleshed out, provides the beginning of an answer to this objection by showing how observational beliefs that are apparently generated by the world might none the less be given a coherentist justification. In this way, a coherent system that involves a putatively observational component will at least seem from the inside to have input from the world and thus not to be isolated. Whether this seeming is likely to be veridical will depend, however, on the more general issue, discussed below, of whether and why coherentist justification should be regarded as conducive to finding the truth.

The second familiar objection, already briefly alluded to earlier, is what may be called the alternative coherent systems objection: even given a relatively strong account of coherence, there will still be indefinitely many different possible systems of beliefs, each of which is as internally coherent as the others, and so all of which will be equally justified on a coherentist view - surely an absurd result. The response to this objection also depends crucially on the idea of observation. If, as suggested earlier, it will be a requirement for justification in an adequate coherence theory that there be a substantial observational component (that is, a substantial proportion of cognitively spontaneous beliefs that the system itself certifies as likely to be true and hence worthy of being accepted), then such alternative systems can no longer be freely invented and it is no longer obvious why they should be thought to exist. Only a system that is actually accepted and employed in cognitive practice can contain cognitively spontaneous beliefs and thus satisfy the requirement for observation. There is no way to guarantee that the acceptance of such beliefs will not lead quickly to incoherence in an arbitrarily devised system, even if it is initially coherent. (As this suggests, it is coherence over a period of time and not just at a moment that is ultimately the basis for justification in all coherence theories that have been seriously advocated.)

The third of the standard objections is in effect a challenge to the coherentist to give a reason for thinking that adopting beliefs on the basis of coherentist justification is likely to lead to believing the truth. Different coherentists give very different responses to this crucial question, each problematic in its own way. These can only be briefly sketched here: (1) The absolute idealists in effect solve the problem by adopting a coherence theory of truth as well, thus reducing the gap between coherentist justification and truth (though only Blanshard is very explicit about this strategy). On such a view, truth is essentially identified with long-run justification, making it relatively easy to argue that seeking justified beliefs is likely to lead eventually to finding true ones - but at the significant cost of adopting an extremely implausible conception of truth. (2) Rescher (1973, 1974, 1977) attempts to give a pragmatic argument to the effect that the practical success which results from the employment of the coherent system makes it likely that the beliefs of the system are at least approximately true (in the sense of corresponding to independent reality). Unfortunately, however, the need for justification for the claims of practical success, which must presumably also be coherentist in character, threatens the project with vicious circularity. (3)

BonJour (1985) attempts to give an a priori 'metajustificatory argument', relying on a rationalist and foundationalist conception of a priori knowledge, for the conclusion that a system of beliefs that remains coherent over the relatively long run, while receiving apparent observational input, is likely to be approximately true (again in the correspondence sense of truth). The main reason offered is that only approximate truth could explain continued coherence in the face of new observations. In addition to defending the general account of a priori justification presupposed, such an approach must also claim that sceptical explanations of one's beliefs (for example their being produced by a Cartesian demon), are a priori less likely than the preferred explanation of correspondence with reality, a claim that many have found highly implausible. (4) Lehrer's approach is to construct alternative conceptions of justification that involve the hypothetical replacement of erroneous beliefs in a person's system of beliefs with their corrected alternatives, and then require that the person's initially justified beliefs remain justified after such replacements in order for such beliefs to constitute knowledge. The main difficulty here is that such an approach seems to concede that 'personal justification' - the sort of justification which exists before the hypothetical replacements - is not in itself conducive to finding the truth, even though such personal justification is the only sort that the believer is in general ever actually aware of.

6 The problem of access

In addition to the foregoing objections, there are a number of further problems with which an adequate coherence theory would have to deal. Perhaps the most urgent of these is that of whether coherentist justification is accessible to the believer in the way that it must be if an internalist position is to result. Assuming for the moment, as is the case with all the positions discussed here, that coherentist justification is taken to require coherence with the believer's entire system of beliefs, then there are three aspects to this problem: (1) whether the believer has adequate access to their system of beliefs; (2) whether the believer has an adequate grasp of the concept of coherence; and (3) whether the believer is able to apply the concept of coherence to their system of beliefs in a way that will yield a definite assessment. All these aspects pose serious problems, and (3) in particular is anything but trivial, even given satisfactory solutions to (1) and (2). But (1) is the most difficult and will accordingly be the main focus here.

A believer's access to their own system of beliefs is in fact seriously problematic in two quite different ways. First, there is the problem of the epistemological status of the result of such access if it were achieved, which we may think of as a reflective meta-belief describing the entire contents of the system. Such a meta-belief would be clearly contingent and empirical and hence one that on any coherence theory of the sort under consideration here ought to be itself justified by appeal to coherence. But since any coherentist justification that is to be accessible to the believer must appeal to such a meta-belief in order to characterize the system of beliefs with which the belief to be justified must cohere, a coherentist justification of that meta-belief itself appears to be totally and irrevocably circular (and no appeal to non-linear justification will help here, since what is being explained is how the very sort of non-linear justification advocated by the coherentist is possible).

The most explicit discussion of this issue is given by BonJour (1985), who responds by invoking what he calls 'the Doxastic Presumption'. The idea is that coherentist justification must *presume* that the believer's grasp of their overall system of beliefs is at least approximately correct (small corrections being possible by appeal to coherence). This has the consequence that the resulting justification is contingent upon the presumed correctness of this grasp, and hence that there is no possible answer on the part of a coherence theory to the specific variety of scepticism that questions whether this presumption is indeed correct. This has seemed to many to be a very drastic result, but it is unclear what the alternative might be, so long as foundationalism is eschewed.

Even if the foregoing issue were resolved in a satisfactory way, there is still the second aspect of the present problem: the quite sticky issue of whether ordinary believers ever in fact possess or could possess anything like the reflective grasp of the entire contents of their systems of beliefs that a coherence theory seems to require. On this issue, it seems likely that a coherence theory will have to concede that ordinary cases of justification are at best only an approximation, and perhaps a fairly distant one, to the ideal justification that a coherence theory portrays.

One further problem is worth a brief mention. If, as is almost always the case, a coherence theory appeals to coherence over the relatively long run, then the issue arises of how the memory beliefs upon which any access to the fact of continued coherence must seemingly rely, are themselves to be justified. Many philosophers have

offered coherence theories of the justification of memory beliefs, but such a view is again threatened with vicious circularity if the only reason for thinking that coherentist justification is conductive to truth - and so that the memory beliefs in particular are true - relies on coherence over time, and so on those very memory beliefs themselves.

Knowledge by acquaintance and description

The attempt to distinguish knowledge by acquaintance from knowledge by description is most closely associated with Bertrand Russell. The distinction is also crucial to one way of trying to develop a plausible foundationalist theory of justification and knowledge. According to Russell one can distinguish the two kinds of knowledge in terms of their respective objects. *Put crudely, one has knowledge by acquaintance of* things*, and one has knowledge by description of* propositions *(representations of reality that are either true or false). But this crude characterization of the two kinds of knowledge is misleading. Russell also seemed to believe that one can have knowledge by acquaintance of properties and even facts (where a fact is a complex consisting of a thing's exemplifying a quality or standing in a relation to another thing). The distinction, then, might be better put in terms of a kind of knowledge which has as its object something that is neither true nor false (knowledge by acquaintance) and a kind of knowledge which has as its object a bearer of truth value (knowledge by description).*

According to Russell, all knowledge of truths ultimately rests on knowledge by acquaintance. The traditional foundationalist in epistemology holds that although I can know one truth by inferring it from something else I know, not everything I know can be inferred in this way. We can avoid a regress of knowledge by holding that at least some truths are known as a result of direct awareness of or acquaintance with those aspects of the world that make the corresponding propositions true.

1 Acquaintance

To distinguish between two *objects* of knowledge is not by itself to say anything very informative about the nature of the respective knowing relations. What is it to know something (a thing, a property or a fact) by acquaintance? Unfortunately, a proponent of the view that such knowledge exists is likely to take the relation of acquaintance to be a primitive. To be sure one can invoke metaphors. When one knows a particular shade of colour by acquaintance, for example, the colour is directly and immediately 'before' one's consciousness. There is nothing 'between' the colour and oneself. By contrast, one might know truths about Julius Caesar but one's access to such truths is only through inference from other things one knows about the contents of history books and the like. A huge expanse of time stands 'between' us and the man, Caesar. The spatial metaphors of 'before' and 'between' are, however, just that - metaphors. As such they are as misleading as they are helpful. More often than not, philosophers who think that there is such a thing as acquaintance do not even take the objects of acquaintance to be in physical space. Classical acquaintance theorists were usually either dualists who took the objects of acquaintance to be properties of a non-spatial mind, or sense-datum theorists for whom sense-data, if in space at all, were in a two-dimensional space. The relational concepts of 'before' and 'between' are clearly most at home in the conceptual framework of three-dimensional space.

If one cannot define the relation, one might attempt to make the concept of acquaintance clear by giving examples of things with which one can be acquainted. Even proponents of the view that there is such a relation as acquaintance do not, however, agree on what one should take the objects of acquaintance to be. The radical empiricists held that the prime candidates for objects of acquaintance include the contents of consciousness (see Empiricism §2). Thus when I am in severe pain, the pain I feel is said to be directly and immediately 'before' my mind. The contents of my visual field, the sensory character of tactile, olfactory, auditory and gustatory sensations, my thoughts and emotions are all held by most radical empiricists to be items with which I can be directly acquainted. In addition, one might hold that the mind is capable of directly encountering such abstract entities as numbers and universals (properties which can be exemplified in more than one thing and are often thought to exist even when not exemplified by anything). The radical empiricists typically denied that one can be directly acquainted with physical objects, items in the past or items in the future. To return to the metaphor, between us and the physical world is the 'veil' of subjective fleeting sensation. Our access to the world of physical objects is always through belief in propositions which can be known only as a result of inference from what we can know about the character of the sensations with which we are acquainted. Likewise, the past (at least the distant past) can be known only through present memory experience, and the future can be known only through our knowledge of the past and present.

2 Additional criteria of acquaintance, and an initial problem

How is one to know whether or not one is acquainted with something? Here the plot gets difficult to follow. According to at least some philosophers, one is directly acquainted with something only if one can know without inference that the thing in question exists or exemplifies some contingent property. The test of whether or not one can know without inference that something exists is itself sometimes described in terms of the conceivability of error. On this view, one sign that I cannot be directly acquainted with the physical table before me now is that my evidence for believing that the table exists does not logically guarantee its existence. My evidence is said to consist of what I know about my sensations, knowledge that would be no different were I dreaming or hallucinating the table's existence. I am directly acquainted with my severe pain because the justification I now have for believing that I have this pain precludes the possibility of my being wrong - I cannot hallucinate the existence of severe pain.

Some critics complain that making the impossibility of error the mark of direct acquaintance is in tension with other things philosophers want to say about the relation of acquaintance. Specifically, acquaintance is not even supposed to involve bearers of truth value. Let us explore this alleged tension.

In addition to giving examples of things with which we can be acquainted, Russell and others also gave negative characterizations of knowledge by acquaintance. When one knows a thing by being acquainted with it, that knowledge does not involve the application of concepts to the thing - one does not categorize the thing. Presumably, knowledge by acquaintance does not even presuppose linguistic or conceptual capacity on the part of the knower. To know a *truth*, on the other hand, one must explicitly or implicitly apply a concept to a thing or property. To think that this colour with which I am acquainted is red is to apply the concept red to the thing with which I am acquainted. According to some philosophers it is only with the application of concepts that it makes sense to talk of truth and error. I can correctly or incorrectly categorize something with which I am acquainted, but the prior act of my being acquainted with the thing does not involve the possibility of error, because acquaintance does not by itself involve an attempt to categorize the thing in question.

But if knowledge by acquaintance does not even involve representations or characterizations which introduce the elements of truth and falsehood, then what has knowledge by acquaintance got to do with knowledge by description? According to Russell, all knowledge by description ultimately depends upon knowledge by acquaintance. But if knowledge by acquaintance does not even involve a bearer of truth value, how can knowledge by acquaintance yield knowledge by description (knowledge of truths)? In a famous argument against those philosophers who seek to find foundations for knowledge in elements of the world that are simply *given* to one, Wilfred Sellars (1963) claimed that proponents of the view face a dilemma (see Sellars, W.S. §3). On the one hand, they want to hold that one needs no concepts to have something given to one. Presumably, even the lower animals have qualities given to them in sensory experience. On the other hand, the given is supposed to end a regress of justification. The foundationalist argues that one cannot infer everything one knows from something else one knows, and thus that there must be a kind of knowledge that does not depend on any other knowledge and which can give us the 'first truths', the 'foundational' premises from which we can infer all other truths (see Foundationalism). But if knowledge by acquaintance does not involve the possibility of error because it does not have as its object something that can be true or false, how can it give us first truths? How can it give us *premises* (which by their very nature must be true or false) from which to infer other truths? Either knowledge by acquaintance does not involve the application of concepts and cannot therefore furnish premises for inference, or it does involve the application of concepts and cannot be distinguished from knowledge by description.

Although Russell is not as clear as he might be about the relationship between knowledge by acquaintance and knowledge by description, it seems that one might offer the following characterization of the way in which the latter depends on the former. The view itself depends on a controversial conception of truth as 'correspondence'. Roughly, the idea is that a bearer of truth value is true when it corresponds to some aspect of reality. On one view, the world contains facts (things having relational and non-relational properties) whether or not those facts are *represented* by conscious beings. Without representations of facts there are neither truths nor falsehoods. But true propositions are made true by virtue of their accurately 'picturing' facts (see Truth, correspondence theory of §1). One can be directly and immediately acquainted with the nonlinguistic (representation-independent) complexes we have called facts. We can call such acquaintance knowledge, but we must be careful to emphasize that having a fact before one in this way does not by itself give one knowledge of a truth. One can be acquainted with a fact without having the capacity to represent the fact, without having a 'picture' of the world that can be made true or false by the fact. But when one does have a representation of the world and one is directly acquainted with the

picture, the fact that makes the picture true and the correspondence between the picture and the fact, one has a kind of propositional knowledge that does not depend on any other propositional knowledge. One has foundational propositional knowledge created by direct acquaintance with features of the world. Furthermore, if my belief that I am in pain, for example, is justified by my standing in a relation of acquaintance to the very fact that makes what I believe true, it seems that my justification would (trivially) guarantee the truth of what I believe (see Russell, B.A.W. §§11-14).

3 Criticisms

This view of the way in which knowledge by acquaintance provides foundations for knowledge seems to rely on a highly controversial correspondence conception of truth. Many philosophers reject the basic idea behind the view that truth consists in representations of the world corresponding to facts. Some of these philosophers will reject the metaphysical category of fact (construed as truth-maker) as an illusion. There are no facts that are independent of conceptual frameworks, some philosophers argue. The world is not divided into things, their properties and relations. Indeed the only distinctions that exist are distinctions that we ‘carve out’ of the world with our concepts and categories. An extreme version of this view would hold that referring to a fact is just another way of talking about a proposition’s being true. To say that the world contains the fact, snow’s being white, is just another way of saying that it is true that snow is white. If such a view were plausible, then it would be a serious, almost pathetic, mistake to suppose that we could ground knowledge of truths in some relation we bear to the facts that make propositions true.

Notice that the attempt (discussed above) to understand foundational propositional knowledge as resting on knowledge by acquaintance, must make intelligible the concept of being acquainted with a *fact*. It is only if we can stand in some direct unproblematic relation to a *truth-maker* that such a relation might be thought of as yielding knowledge of a *truth-bearer*. Consequently, any philosophical misgivings one has about the metaphysical category of fact, and with it the concept of being acquainted with a fact, might translate into misgivings about the epistemic utility of the concept of knowledge by acquaintance. That we might stand in some kind of direct relation to a thing or property seems neither here nor there when it comes to gaining non-inferential, direct knowledge of truths. Only a *structured* reality could make propositions true and only acquaintance with such structure would be a plausible candidate for the source of foundational knowledge.

Even if one embraces the metaphysical category of fact construed as something that is distinct from representations of it, one might still have qualms about the intelligibility of this relation of direct acquaintance that we are supposed to bear to some, but not all, facts. Many contemporary philosophers argue that the very nature of justification precludes the possibility of having justification for believing empirical propositions that eliminates the possibility of error. Some of these arguments rely on thought experiments which describe sources of error even when one has the best imaginable evidence. Others invoke theoretical models about the nature of judgment which require us to recognize always the possibility of error with respect to empirical judgment. If, for example, judgment always involves relating something present to something past, then it seems doubtful that our justification for accepting such judgments could ever preclude the possibility of error.

Even if the acquaintance theorist can respond to criticisms, what positive reason could one give for supposing that the relation of direct acquaintance exists? Here, the dialogue is likely to reach an impasse. Proponents of the view that there is such a thing as direct acquaintance are quite likely to claim that they are directly acquainted with the fact that they are directly acquainted with certain facts. Such a claim is unlikely to make their critics happy, but then a proponent of the view probably does not care much about making critics happy. After all, if the concept of direct acquaintance with a fact is intelligible, why should one not use the concept in the course of justifying a belief that the relation exists?

Knowledge, causal theory of

Epistemologists have always recognized the importance of causal processes in accounting for our knowledge of things. In discussions of perception, memory and reasoning, for example, it is commonly assumed that these ways of coming to know are fundamentally causal. We perceive things and thus come to have knowledge about them via complex causal processes; memory is, at least in part, the retention of previously gained knowledge through some sort of causal process; and reasoning is a causal process that takes beliefs as inputs and generates beliefs as outputs.

A causal theory of knowledge is a form of externalism and is based on the fundamental idea that a person knows some proposition, p, *only if there is an appropriate causal connection between the state of affairs that makes* p *true and the* person's *belief in* p. *Although this kind of theory has roots that extend to ancient times, contemporary versions attempt to make more precise the nature of the causal connections required for knowledge. The causal theory is closely related to other forms of externalist theories, such as the conclusive reasons theory, information-theoretic views and the various forms of reliabilism.*

1 Formulation of the causal theory of knowing

In the internalist-oriented environment which dominated epistemology from the time of Descartes until the middle of the twentieth century, it was not considered appropriate to refer to the causal history of a belief in providing an analysis, or definition, of the positive epistemic status of that belief (see Internalism and externalism in epistemology). Rather, the epistemologist's job was to provide definitions of concepts such as justification and knowledge independently of any assumed causal connections with the external world, and then to show how, from such analyses, one could argue ('internally') that such causal connections exist. To do otherwise would be to beg the question against scepticism about the external world.

Since the 1960s, there has been a shift away from the internalist position in epistemology. The causal theory of knowing is one of the early versions of externalism, introduced by Alvin Goldman (1967) and conceived primarily as a response to the Gettier problem which had appeared only a few years earlier (see Gettier problems). In Gettier examples, a person, *S*, has a justified belief in something that is only coincidentally true. This element of coincidence, which is perhaps the most salient feature of Gettier cases, is very difficult to explain without introducing some element of external connection between the individual's belief, the justification for that belief and the state of affairs which is the object of the belief. Goldman's original proposal was to focus on the causal connections that typically obtain between these various epistemically relevant items when a person has knowledge.

Goldman expressed his proposal as a set of truth-conditions for knowledge, in the following schematic form:

[A person] *S* knows that *p* if and only if the fact *p* is causally connected in an 'appropriate' way with *S*'s believing *p*.

The ways that are 'appropriate' include perception, memory, various other kinds of causal chains and forks, and combinations of these. Goldman adds to this the further condition that the relevant causal connections obtaining between the state of affairs *p* and one's belief must be 'correctly reconstructed by inferences, each of which is warranted'. This further condition is designed to accommodate the fact that causal chains can sometimes take very unexpected routes. If the route is unusual enough, then even though it results in a true belief that *p*, it does not provide knowledge. For example, suppose that Sally is perceiving an object only through a complex network of mirrors, or via some holographic imaging device which produces a very realistic image of the object. Then, she might come to believe that the object is in front of her when in fact it is, but she might fail to know that it is there, as she knows nothing about the unusual causal mechanism. If she were in a position to correctly reconstruct the causal chain, however, then she would have knowledge.

One example developed by Goldman that illustrates the intuitive appeal of his proposal involves a person, Smith, who perceives solidified lava lying around a mountain. On the basis of beliefs about this lava, and background beliefs, Smith inferentially comes to believe, correctly, that the mountain erupted many centuries ago. Assuming that Smith's inferences are warranted, does he know? To answer this, we must ask what sort of causal ancestry obtains between the eruption of the mountain and Smith's belief that it has erupted. If the lava that he sees resulted

from the eruption, as he imagines, then Smith does have knowledge. However, suppose that unknown to Smith the lava has been placed there by promoters who wish to make it look as though the area was once volcanic. The lava actually produced by the eruption has been completely covered by years of sedimentation, and cannot be seen. Then, there is no appropriate causal connection between eruption and perceived lava, and Smith does not know. The naturally intuitive appeal of such an example is confirmation that Goldman's causal theory captures at least part of what we require for knowledge.

2 The Gettier examples

In Gettier examples, the requirement that there be an appropriate causal connection between the fact *p*, and *S*'s (warranted) belief, is not satisfied, very much along the lines illustrated in the lava case. This can be seen by considering a specific (Gettier-style) example, introduced by Keith Lehrer (1965). Suppose Smith correctly infers that someone in his class owns a Ford, from some true evidence that justifies the false belief that a student, Mr. Nogot, owns a Ford. It so happens that another student in Smith's class, Mr. Havit, does own a Ford, but Smith has no evidence one way or the other for this proposition. The causal theory clearly explains the lack of knowledge in this example, since the state of affairs making it true that someone in Smith's class owns a Ford (namely, Havit's owning a Ford) is not causally related in any of the appropriate ways with Smith's belief. Rather, Smith's belief is caused by states of affairs which make true the evidence on which his belief that Mr. Nogot owns a Ford is based. And, these states of affairs, whatever they are, have nothing to do with Mr. Havit's ownership.

It should also be noticed that if this case were redescribed so that Smith does have evidence that Havit owns a Ford, then it would be clear (all else being equal) that he does have knowledge that someone in his class owns a Ford, for then the required causal connection would obtain. It can be concluded that in Gettier examples, as well as 'ordinary' cases in which we would tend to ascribe knowledge to individuals, the causal theory provides a clear and intuitively appealing account of knowledge.

3 Problems for the causal theory

Despite its merits, there are a number of examples that raise serious difficulties for the causal theory. One class of examples is generated by the phenomenon of causal overdetermination. Suppose Alfred comes to believe that there is a sheep in the field by hearing a recording of the sounds normally produced by sheep while also looking at a distant boulder that looks like a sheep in the field. Even if there is a sheep somewhere in the field not seen by Alfred, he does not know that one is there. Later, should he come to perceive the real sheep, he would come to know that there is a sheep in the field. The problem for the causal theory is that Alfred's later perception of the real sheep would not cause his belief in an appropriate way, because his belief already exists. The causal theory would incorrectly deny that Alfred has knowledge. This kind of case can be accommodated within the general spirit of the causal theory by allowing as 'appropriate' the relation of causal sustaining, a very weak form of causal connection.

More difficult to accommodate are overdetermination cases in which an individual is acquainted with some state of affairs which is causally sufficient for the state of affairs *p*, but which is not in fact any part of the cause of *p*. Abigail might, for example, be aware that Jones has taken a fatal dose of poison, with no antidote, and thereby come to know that Jones is dead even though in fact (but unknown to her) Jones died of other causes. The only way to accommodate such an example is to further extend the scope of 'appropriate causal connections' to include cases in which one infers *p* from something which is causally sufficient for *p* even though not the cause or any part of the cause of *p*. It is not obvious, however, that this kind of modification is in the spirit of the causal theory, for it abandons the idea that knowledge requires a causal *connection* between belief and known fact.

Equally troubling for the causal theory are situations involving logical and/or mathematical facts. One kind of situation is very similar to the example just given. Suppose Mark observes that an owl is on top of a flagpole, which he already knows to be 15 feet high. He also observes a mouse to be 12 feet from the bottom of the flagpole. Mark correctly infers that the mouse is a little over 19 feet from the owl. But, the mouse's being a little over 19 feet from the owl is no part of the cause of Mark's belief in that fact, nor are the facts from which he makes the inference themselves causes of the mouse's distance from the owl. Rather, this is a case in which the fact concluded follows logically from the observed premises. To take another example, suppose that the object of belief is itself a logical or mathematical truth, such as '2 + 2 = 4'. Surely a theory of knowledge should allow for

knowledge of such truths, but the causal theory faces serious obstacles in attempting to provide an account. Whatever the nature of the facts which make true logical and mathematical truths, they do not seem to be the sorts of facts that are parts of causal chains. If not, then there can be no appropriate causal connection of any kind between such facts and one's beliefs. It should be noted, however, that there have been some serious efforts, particularly by Mark Steiner (1973) and Philip Kitcher (1984), to accommodate mathematical and logical knowledge within the framework of a causal theory.

In his own effort to accommodate examples involving inferences based on logical connections, such as the one concerning the owl and mouse, as well as knowledge of mathematical and logical truths, Goldman (1967) proposed that the scope of 'appropriate causal connection' be extended even further to include logical and mathematical connections. Even those philosophers who are inclined to be sympathetic with the previously mentioned extensions of the notion of a causal connection have baulked at this idea. Peter Klein (1976) argues that there is no adequate way of formulating a version of the causal theory which allows logical and mathematical connections to be counted as causal.

The problematic examples discussed thus far have raised questions about the necessity of the 'appropriate causal connection' requirement. There are also difficult examples that raise doubts about the sufficiency of the 'appropriate causal connection' requirement, even in its most refined forms. Perhaps the most famous of these examples is one introduced by Goldman himself (1976), leading to his own ultimate abandonment of the early version of his causal theory.

In this example, we are to suppose that Henry is driving through the countryside looking at the scenery. One of the things he sees is a barn, and on the basis of this perfectly ordinary perceptual evidence, along with his background beliefs about barns, Henry comes to believe that there is a barn there. Unknown to him, however, the region is populated by papier-mâché barn facsimiles, of the sort found on movie-studio lots. These facsimiles, which are propped up by sticks from behind, would be mistaken by Henry, or anyone else, for real barns when sighted casually from the road. It is only by good fortune, or coincidence, that Henry has perceived a real barn rather than a facsimile. Given this, Henry cannot be said to have knowledge that the object he sees is a barn, for he could just as well have been perceiving a facsimile. The problem is that Goldman's causal theory of knowledge is satisfied: Henry's belief that there is a barn there is caused in a perfectly straightforward way by the presence of the barn, and we may suppose that Henry has correctly reconstructed through warranted inferences the causal chain leading to this belief. So, if Henry does not have knowledge, the conditions of the causal theory do not appear to be sufficient for knowledge.

In light of these and other difficult counterexamples to both the necessity and the sufficiency of the causal theory, it has largely been abandoned, at least in the form originally suggested by Goldman in which a causal connection between state of affairs and belief is required.

4 Successors to the causal theory of knowing

The causal theory of knowing still survives in many of the externalist theories which have arisen since Goldman's early proposal. Among the more prominent theories in this category are the 'conclusive reasons' approach, exemplified in the works of Dretske and Armstrong, and various versions of Reliabilism, exemplified in the later works of Goldman, and in works by Swain, Alston and Plantinga.

Goldman (1976) proposed a modification of the early causal theory in which it is required not only that the individual's belief that *p* be caused in an appropriate way by the state of affairs *p*, but also that the individual be a reliable discriminator with respect to *p* and other, alternative states of affairs that might causally substitute for *p*. When this discriminatory capacity is lacking, or is not functioning properly, then the individual fails to know even if the causal connection requirement is met. In this way, examples such as the one involving Henry can be accounted for.

But even with this modification, the causal theory cannot handle examples in which there is no causal connection of the required sort, such as the mathematical and logical cases illustrated above. Ultimately, the requirement that there be an actual causal chain linking the state of affairs that makes *p* true with the belief that *p* must be abandoned. Taking its place is the notion of an 'appropriate causal *ancestry*' of a belief. A belief is an instance of knowledge, according to this kind of causal theory, provided it is produced in an appropriate manner, where the

manner of production is appropriate just in case it is *reliable*. A theory which holds this is called a ‘reliability theory’, and is the main kind of successor to the early casual theories (see Reliabilism).

Knowledge, concept of

The branch of philosophy concerned with the nature and extent of human knowledge is called epistemology (from the Greek epistēmē *meaning knowledge, and* logos *meaning theory). Knowledge seems to come in many varieties: we know people, places and things; we know how to perform tasks; we know facts. Factual knowledge has been the central focus of epistemology.*

We can know a fact only if we have a true belief about it. However, since only some true beliefs are knowledge (consider, for example, a lucky guess), the central question asked by epistemologists is 'What converts mere true belief into knowledge?'. There are many, and often conflicting, answers to this question. The primary traditional answer has been that our true beliefs must be based upon sufficiently good reasons in order to be certifiable as knowledge. Foundationalists have held that the structure of reasons is such that our reasons ultimately rest upon basic reasons that have no further reasons supporting them. Coherentists have argued that there are no foundational reasons. Rather, they argue that our beliefs are mutually supporting.

In addition to the constraints upon the overall structure of reasons, epistemologists have proposed various general principles governing reasons. For example, it seems that if my reasons are adequate to affirm some fact, those reasons should be adequate to eliminate other incompatible hypotheses. This initially plausible principle appears to lead directly to some deep puzzles and, perhaps, even to scepticism. Indeed, many of the principles that seem initially plausible lead to various unexpected and unwelcome conclusions.

Alternatives to the primary traditional answer to the central epistemic question have been developed, in part because of the supposed failures of traditional epistemology. These alternative views claim that it is something other than good reasons which distinguishes (mere) true beliefs from knowledge. Reliabilists claim that a true belief produced by a sufficiently reliable process is knowledge. Good reasoning is but one of the many ways in which beliefs can be reliably produced. The issue of whether the objections to traditional epistemology are valid or whether the proposed substitutes are better remains unresolved.

1 The varieties of knowledge

Knowledge comes in many varieties. I can know *how* to adjust a carburettor. I can know a person. I can know *that* mixing bleach and ammonia is dangerous. In the first case, I possess a skill. In the second, I am acquainted with someone. In the third, I know a fact. Epistemologists have differed on the relationships between these types of knowledge. On the one hand, it could be held that knowing a person (place or thing) should be construed as nothing more (or less) than knowing certain facts about that someone and possessing the skill of being able to distinguish that person from other objects. On the other hand, it has been held that knowing facts depends upon being acquainted with particular objects. Whether the reduction of one form of knowledge to another is ultimately successful is an area of contention among epistemologists (see Knowledge by acquaintance and description).

Nevertheless, it is knowledge of facts, so-called *propositional knowledge*, as opposed to knowledge by acquaintance or the possession of skills, that has been the central concern of epistemologists. The central question can be put this way: which beliefs of mine are to be counted as knowledge? This question presupposes that knowledge is a species of belief, but some might think that knowledge and belief are mutually exclusive: for example, we say such things as 'I do not *believe* that; I *know* it'. But we also say such things as 'I am not *happy*; I am *ecstatic*'. A suggested paraphrase of this expression seems to capture what is meant without denying the obviously true claim that ecstasy is a form of happiness. The paraphrase is: I am not *merely* happy, I am ecstatic. The parallel is: I do not merely believe it; I know it. Thus, this type of linguistic evidence does not support the suggestion that belief and knowledge are mutually exclusive. In general, epistemologists have held that propositional knowledge is a species of belief.

2 Propositional knowledge is not mere true belief

Propositional knowledge is a species of belief; but which beliefs are knowledge? The first thing to note is that a belief must be true in order for it to count as knowledge. But that is obviously not enough. First, true beliefs can be based upon faulty reasoning. Suppose that I believe that smoking is a leading cause of fatal lung cancer because I infer it from the fact that I know two smokers who died of lung cancer. The generalization is true, but my evidence

is too meagre for my belief to count as knowledge. Second, true beliefs can be based on false beliefs. Modifying an example used by Bertrand Russell, suppose that I believe truly that the last name of the President of the United States in 1996 begins with a ‘C’. Also suppose this belief is based upon the false belief that the President is Winston Churchill. My true belief that the President’s name begins with a ‘C’ is not knowledge because it is based on a false belief.

Third, even some true beliefs resulting from good reasoning based upon true beliefs are not knowledge. Suppose that I believe (truly) that my neighbours are at home. My belief is based upon good reasoning from my true belief that I see lights on and that, in the past, the lights have been on only when they were at home. But suppose further that this time the lights were turned on by a guest and that my neighbours had just entered the house and would not have had time to turn on the lights. In this case, I fail to know that my neighbours are home. So, the central question becomes: what must be added to true belief to convert it into knowledge?

3 Warrant

The property, whatever it is, that, if added to true belief converts it into knowledge, we may refer to as ‘warrant’. Knowledge, then, is true, warranted, belief. But simply to name the missing property does not bring us closer to understanding it and we must be careful not to think of ‘warrant’ as a sophisticated synonym for ‘justified’. Let us say that a belief is *justified* just in case we are entitled to hold it on the basis of suitable reasons available to us. In the neighbour/lights case mentioned above, we have already seen that justification is not sufficient for warrant. Whether it is even necessary will be important in the discussion that follows, especially in §6.

Given the great variety of approaches to an account of warrant, is there any common, underlying starting point embraced by epistemologists? Yes: a warranted belief is one that is not held on the basis of mere cognitive luck. Plato appeals to that intuition in the *Theaetetus*; Aristotle’s account of the transition from ignorance of the first principles in science to knowledge of them in the *Posterior Analytics* is designed to demonstrate that there are reliable cognitive mechanisms whose output is not the result of chance; Descartes (1641) proposes methods for acquiring beliefs that would (he thinks) necessarily lead to truth; Locke (1689) suggests that even if persons arrive at a true belief by accident, they are not thereby free from criticism.

Let us start with the assumption that a proposition is known just in case it is not an accident, from the cognitive point of view, that it is both believed and true. Hence the task becomes one of developing an account of warrant that accurately portrays what it is that makes a belief non-accidentally true from the cognitive point of view.

4 Foundationalism and coherentism

There are two main, traditional approaches to the account of justification: foundationalism and coherentism. Both are *normative* views about rules in virtue of which propositions *ought* to be accepted or *ought* to be rejected or *ought* to be suspended (see Knowledge and justification, coherence theory of; Foundationalism; Normative epistemology). In order to characterize these approaches, recall how the ancient Pyrrhonian Sceptics divided the possible structures of reasons that provide a basis for accepting a belief (see Epistemology, history of; Pyrrhonism). Suppose you hold a belief and offer another belief as the reason for the first - for example, suppose you believe that Ford cars are generally less expensive than BMWs. Your reason could be your belief that you were told so by a reliable person. An obvious question arises: what is your basis for believing that the person is reliable? You could answer with another reason and that reason could, itself, be supported by a further reason, and so on.

This process of providing reasons for your beliefs can have only three possible structures:

Foundationalism: The process of giving reasons could be such that not every reason is supported by another reason because there are *basic reasons* which have no need of further reasons supporting them.
Coherentism: The process of giving reasons could have no reason that is not supported by another reason, but there is not an infinite number of reasons. Thus, beliefs are mutually supporting.
Infinitism: The process of giving reasons could have no reason that is not supported by another reason, but there is an infinite number of reasons.

Foundationalism and coherentism have both been developed and defended, and there are well-known objections to

each view. In contrast, the *prima facie* objections to infinitism have seemed so overwhelming that it has not been investigated carefully. Infinitism *seems* to require that a person should have an infinite number of beliefs (which *seems* on its face to be false). In addition, it *seems* to lead inevitably to the conclusion that no belief could ever be justified, since the process of justification would never come to an end.

The standard objections to foundationalism are several. First, as the Pyrrhonians would point out, there must be a distinction between what makes a belief *properly* basic and what makes it simply one for which no other reason is, in fact, given. Otherwise, the offered 'basic' reason is arbitrary. But if there is some further reason for thinking that an offered reason is not arbitrary, then there is a reason for accepting it, and the offered reason is, thereby, not basic. Hence, there can be no foundational propositions.

Second, some preferred candidates for properly basic reasons seem not to be properly basic on closer inspection. Consider perceptual judgments - the source of most of our knowledge of the external world according to many philosophers (see Empiricism; A Posteriori). A reason for believing that there is a tree before me is that I see a tree before me. But the latter proposition does not appear to be properly basic because one could be required to explain what it is about what is seen that leads one to believe that it is a *tree* that one sees (as opposed to an illusion). Thus, some foundationalists have retreated to sensation-beliefs (so-called sense-data propositions) as their candidates for properly basic beliefs: for example, 'I seem to see a green, brown, tallish object' (see Ayer, A.J.; Broad, C.D.; Moore, G.E.). But although these propositions might seem to be properly basic, there are notorious problems with the sense-data view (see Perception, epistemic issues in; Sense-data). First, the proffered basic beliefs seem to be too meagre to provide a sufficient basis for the rich scope of things we seem to know. For example, how can my knowledge that objects persist when not being perceived be traced to particular sense-data? Second, it appears that our knowledge of the way in which to characterize our sensations (private sensations accessible only to the individual having them) depends upon our knowledge of public objects (see Criteria; Wittgenstein, L.J.J.). How could we know, for example, that we have a throbbing pain without first recognizing what it is for a public object (say, a muscle) to be throbbing?

Foundationalists have developed answers to these objections in part by liberalizing the requirements either for being properly basic or for being an acceptable pattern of inference from the foundational propositions to the non-foundational ones (see Inference to the best explanation). For example, *contextualist* accounts of knowledge have been developed that hold that a proposition is properly basic just in case it is accepted by the relevant community of putative knowers. In a discussion with a friend I could offer as my reason for believing another moon of Jupiter had been discovered that 'I read it in the newspaper'. I would not need further reasons for believing that I read it. In contrast, at a convention of astronomers that reason would not be accepted. Hence, contextualists claim, what counts as a basic reason is context-dependent.

There are two obvious responses to contextualism. The first is that it might be an accurate description of some aspects of our epistemic practices, but the fundamental Pyrrhonian question remains: what distinguishes a properly basic proposition from one that is merely offered and accepted by a community of putative knowers? The issue concerns what beliefs, if any, *ought* to be offered and accepted without further reasons. The question is not what beliefs *are* offered and accepted without further reason. The second response is a corollary of the first. Knowledge seems to be a highly prized state of belief (as Plato put it). But, if the contextualists were right, I would gain knowledge by joining a community of rather epistemically gullible and permissive folk. That hardly seems right! (See Contextualism, epistemological.)

In sum, it remains a subject of dispute among epistemologists whether the stock of purported foundational propositions can be made sufficiently rich and abundant without including too many that clearly require evidential support, or whether the patterns of inferences can be liberalized sufficiently without allowing patterns that are not sufficiently truth-conducive.

The historical rival of foundationalism is coherentism. Coherentists deny that there are basic reasons and claim that all propositions derive their warrant, at least in part, from other propositions. The fundamental objection is this: Typically, we recognize that arguing in a circle is not an acceptable pattern of inference, so what makes it acceptable in some cases? Suppose I believe that apples contain vitamin C, at least in part because I believe that fruits contain vitamin C. I would surely be appropriately accused of circular reasoning if I believed, in part, that fruits contain vitamin C because apples do.

Coherentists would be quick to point out that they are not really suggesting that one should argue in a circle. Rather, they would point to the fact that our beliefs come in bunches with a web-like structure (see Quine, W.V.). They are ‘mutually supporting’ just as the poles in a tepee are mutually supporting. A belief is warranted just in case it is a member of a set of coherent beliefs.

But whether these colourful analogies answer the basic objection is not clear. Presumably, circular reasoning is not acceptable because although it might be the case that if you believe b_1 it might be reasonable to believe b_2, and if you believe b_2 it might be reasonable to also believe b_1, their mutual support gives you no reason for believing them both. Thus, the fundamental question is this: What makes one total set of coherent beliefs, say T_1, any more acceptable than an alternative total set of coherent beliefs, say T_2?

The Pyrrhonian Sceptics would point out that coherentists either have an answer for that question or they do not. If they do, then they seem to have abandoned their central view, since there now seems to be a reason for adopting the set of beliefs, T_1, that is not one of the beliefs in T_1. Indeed, if they provide an answer, they have embraced foundationalism. If they do not have an answer, then it seems that adopting T_1 is arbitrary. Coherentists have attempted to answer this objection by giving a ‘meta-justification’ for thinking that certain kinds of coherent belief systems are likely to contain true members. Indeed, some have argued that coherent beliefs are, by their very nature, likely to be true (see Davidson, D.). But whether that strategy will suffice to answer the objections remains an open question in epistemology.

5 Defeasibility theories

A basic objection to the foundationalist’s and coherentist’s accounts of justification is that neither seems to be able to show that a true belief which satisfied their accounts would be non-accidentally true. First, as the neighbour/lights case showed, a true belief could be fully justified on their accounts, but not be knowledge. Second, as the Pyrrhonians pointed out, either the beliefs seem to rest upon arbitrary foundations or they seem to be only one of many, equally coherent sets of beliefs. The defeasibility theory was developed, in part, to address these issues. It holds, roughly, that it is not only the evidence that one possesses that makes a belief warranted; it is equally important that there is no defeating evidence that one does not possess. That is, in order for a belief to be warranted it must not only be justified (in the sense required by either the foundationalists or the coherentists) but its justification must be such that there is no truth which, if added to the reasons that justify the belief, is such that the belief would no longer be justified (see Knowledge, defeasibility theory of).

The defeasibility theory can explain why it is not a cognitive accident that the warranted belief is true. If any of the important supporting reasons (those that if removed would destroy the justification) were false, then adding the denial of those reasons (in other words, adding the truth) to one’s beliefs would undermine the justification. In addition, if there is evidence that one does not possess such that it makes it an accident that the belief is true, the propositions describing that evidence would undercut the justification.

A well-known case will help to illustrate this (see Gettier problems). Suppose that I know Tom Grabit well and I see what appears to be Tom stealing a library book: I come to believe that Tom stole a library book. And, let us suppose that Tom did indeed steal the book. Foundationalists and coherentists could deploy their accounts in order to show that the belief is justified. Nevertheless, suppose that, unknown to me, Tom has an identical twin, John, who is a kleptomaniac and was in the library on the day in question and stole a copy of the same book. Even though I arrived at a true belief as a result of good reasoning based upon true propositions, I do not know that Tom stole the book since it is accidental, from the cognitive point of view, that I arrived at the truth. I could just as easily have based my belief on having seen John stealing the book.

The defeasibility theorists would point out that the belief that Tom stole the book is defeated; if the true proposition describing John were added to my beliefs, I would no longer be justified in believing Tom stole the book. In general, the defeasibility theory can rule out accidentally true beliefs as warranted because those beliefs would not be able to stand up to the truth.

Nevertheless, the defeasibility theory has its problems. The primary one is that it seems to exclude too much from what we know. Returning to the Grabit Case, suppose that everything is as it was except that Tom does not have a

twin but that Tom's mother sincerely avows the claims about John. Now, there is a true proposition (Tom's mother has said sincerely that Tom has an identical twin, John) that defeats the original justification. Hence the belief that Tom stole the book would be defeated. But if Tom's mother were demented and there never was a twin, it seems that I knew all along that Tom stole the book.

Defeasibility theorists have tried to answer this objection by suggesting ways to distinguish between so-called misleading defeaters (for example, Mrs Grabit sincerely avows that Tom has an identical twin, John) and genuine ones (for example, Tom has an identical twin, John), but there is no agreement among epistemologists that any of these suggestions has succeeded in correctly capturing the distinction between genuine and misleading defeaters.

6 Externalism

Partly in response to the difficulties with foundationalism and coherentism even as supplemented by the defeasibility theory, epistemologists have developed a variety of alternative accounts of warrant. They have been called 'externalistic' because their accounts of warrant focus on features of the world other than the knower's reasons for belief. Two important ones are the causal theory and the reliabilist theory (see Knowledge, causal theory of; Reliabilism).

In their purest forms, these accounts begin with the view that knowledge, and hence warrant, does not require justification. The foundationalists had already conceded that there are no reasons for properly basic beliefs. This seemed to create a problem for foundationalism only because it was assumed that all beliefs needed to be justified and the 'basic' reasons appeared to be arbitrary. But drop the requirement that beliefs need to be justified in order to be warranted, and this problem immediately disappears.

Roughly, the causal theory of warrant holds that a belief is warranted if and only if the state of affairs represented in the belief is appropriately causally related to the belief. For example, suppose I come to believe that there is a bird in a tree as a causal consequence of seeing the bird in the tree. Sometimes the causal connection is more complex; but this direct type of causal connection between the belief and what it represents will suffice for our purposes.

This theory is initially appealing because it appears to satisfy the basic requirement that a warranted belief be non-accidentally true since the state of affairs represented in the belief is a cause of my belief. However, it is easily seen to be both too weak and too strong; and there seem to be some deep problems with it as a general account of warrant. It is too weak because it would count some true beliefs as warranted that clearly are not known. Recall the Grabit case. My belief that I see Tom stealing the book is caused by Tom's stealing the book, but if he has an identical twin, I do not know that Tom stole the book. It is too strong because there seem to be many beliefs that count as knowledge which can not be appropriately *causally* related to what they represent. Suppose I know that there is no elephant smaller than a kitten: what possible *causal* connection could there be between there being no elephant smaller than a kitten and my belief? In addition, potential difficulties arise about knowledge of a priori propositions (such as 2 + 2 = 4) and counterfactuals (such as, if it were raining today, we would have called off the picnic). It looks as though there is no possible way to produce a causal connection between my belief and what is represented in the belief - at least as 'cause' is usually understood (see A priori).

Nevertheless, a basic tenet of the causal theory might still be correct: Not all beliefs need to be based on reasons in order to count as knowledge. The reliabilist theory of warrant can be seen as the successor of the causal theory. Instead of requiring an appropriate causal connection between the states of affairs represented in the belief and the belief itself, a typical form of reliabilism holds that a belief is warranted just in case the process resulting in the belief produces true beliefs sufficiently often.

Thus, the non-accidental nature of the true belief receives a very straightforward analysis. The belief is non-accidentally true because the process that produces the belief produces true beliefs sufficiently often. This view has many advantages over the causal theory. My belief that elephants are larger than kittens need not be caused by that state of affairs. All that is required is that the process by which I come to believe that proposition typically (often enough) results in true beliefs. A priori or counterfactual propositions present no problem since there could be reliable processes that produce those beliefs.

Nevertheless, there are problems confronting this view. Suppose that you require that the process should produce

true beliefs on 100 per cent of the occasions on which it arises. That is a very stringent condition; but it is not stringent enough! For if the belief that Tom Grabit stole a book arises only once in the history of the world - the time I saw him stealing the book - the actual process produced a true belief 100 per cent of the times it arose; but it is not knowledge. The obvious move for the reliabilist is not only to include the actual occasions when the particular belief is produced but rather to consider whether the type of process that produced this belief would produce true beliefs of this type sufficiently often. But correctly characterizing those types has not proved easy. Is the type of belief one in which Tom is involved? Or identical twins? Or libraries? That seems too narrow. Is the type of process one in which there is first a perception and then some inferences? That seems too broad. It remains an open question whether reliabilism can produce an acceptable account of the types of processes and the types of beliefs.

Finally, there is one further objection that some epistemologists have brought against reliabilism. Perhaps it is best illustrated in a case presented by Keith Lehrer (1990: 163) that can be summarized as follows: a certain Mr Truetemp has a thermometer-with-temperature-belief-generator implanted in his head so that within certain ranges of temperatures he has perfectly reliable temperature beliefs. When it is 50 degrees, he comes to believe that it is 50 degrees. When it is not 50 degrees, he does not come to believe that it is 50 degrees. He holds these beliefs without knowing why he does.

Such beliefs would satisfy all of the requirements suggested by the reliabilists, but many epistemologists would hold that although Mr Truetemp has true beliefs and they are not accidentally true because his thermometer-with-temperature-belief-generator is reliable, they are accidentally true *from the cognitive point of view*, as he has no reasons at all for his beliefs. Indeed, some would say that what Mr Truetemp possesses is a skill (of telling the temperature) and not propositional knowledge at all.

Here we can detect a fundamental clash of intuitions. The reliabilists would hold that Mr Truetemp does know; the traditional normativists would hold that he does not. There appears to be no way to satisfy both. But this much seems clear: There are some situations in which the steps in the process that brings about a belief include the holding of reasons. In those cases in which there is no automatic true-belief-generator (as in the Truetemp case) and in which we must rely upon our reasoning to arrive at a belief, the questions asked by the traditional normativists are crucial: what must the structure of our reasons be so as to make a true belief acceptable? Are there foundational reasons? Can mutually supporting reasons be offered without begging the question? (Could reasons be infinite in number?) And need those reasons be such that they are not undermined by the truth, as the defeasibility theorists would hold? At least in some cases, it seems that normative standards for belief-acquisition apply and their satisfaction will determine whether a belief ought to be accepted. Thus, it appears that an evaluation of the conditions under which beliefs ought to be accepted, denied or suspended is inescapable (see Internalism and externalism in epistemology; Justification, epistemic).

7 Epistemic principles

Epistemic principles describe the normative epistemic status of propositions under varying conditions (see Epistemic logic). It is generally agreed that if a person, *S*, is justified in believing any proposition, *x*, then *S* is not at the same time justified in believing that not-*x*. Foundationalists and coherentists alike can, and typically do, accept this principle. Other principles are more controversial. They are intuitively plausible but they seem to provide a basis for scepticism and for some deep epistemic puzzles. Here are three of the more interesting principles.

Conjunction Principle (CON-P): If *S* is justified in believing that *x*, and *S* is justified in believing that *y*, then *S* is justified in believing that (*x* and *y*).
Closure Principle (CLO-P): If *S* is justified in believing *x*, and *x* entails *y*, then *S* is justified in believing that *y*.
Evidence Transfer Principle (ET-P): If there is some evidence, *e*, that justifies *S* in believing that *x*, and *x* entails *y*, then *e* justifies *S* in believing that *y*.

In each principle and with suitable grammatical modifications ‘justified’ could be replaced by other epistemic terms, such as ‘reasonable’, ‘plausible’, ‘evident’, ‘certain’. Furthermore, each principle is designed to capture a basis upon which a positive normative epistemic status of a proposition can be transferred to another proposition. As a corollary, ‘*S* is justified in believing *x*’ is not taken to entail ‘*S* does believe that *x*, justifiably’. For *S* may not

form the belief because of a failure to see the connection between the propositions. Finally, with regard to CLO-P and ET-P, since a tautology is entailed by every proposition, the entailment must be restricted to some form of relevant entailment and/or the range of propositions must be restricted to contingent ones (see Relevance logic and entailment). Other restrictions are no doubt necessary; but these three seemingly intuitive principles have been challenged at their core.

It is important to see some of the relationships between these principles. CLO-P does not entail CON-P since the CLO-P is about *one* proposition that *S* is justified in believing, not *sets* of propositions. In addition, CLO-P does not entail ET-P because CLO-P does not require that it is the *very same evidence*, *e*, that *S* has for *x* that justifies *y* for *S*. Thus, one can accept CLO-P without accepting either of the other principles.

8 The epistemic principles and scepticism

Scepticism - the view that we lack knowledge in those areas commonly thought to be within our ken - comes in many varieties. The most extreme view is global scepticism. It holds that we have very little, if any, knowledge. That view seems preposterous at first glance. Indeed, some epistemologists think that any theory that leads to global scepticism should, *ipso facto*, be rejected (see Commonsensism; Scepticism). Yet there are many arguments for global scepticism that are difficult to answer. In addition, more modest forms of scepticism about particular subject matters (for example, other minds or the future) have been developed. But since the more modest sceptics employ strategies similar to those employed by the global sceptics, I here consider only the most extreme form of scepticism - global scepticism (see Other minds).

We have already seen the basis for one such argument for global scepticism that can be gleaned from the Pyrrhonians, namely:

(1) All knowledge requires having reasons that are neither arbitrary nor question-begging nor infinitely many.
(2) The only structures for reasons are such that reasons are either arbitrary (foundationalism), question-begging (coherentism) or infinitely many (infinitism).
Therefore, there is no knowledge.

There are at least four possible responses to this argument: (1) the foundational, basic propositions are not arbitrary; (2) coherentism does not necessarily lead to question-begging arguments; (3) requiring infinitely many reasons for a belief does not entail that a belief cannot be justified; (4) not all knowledge entails having reasons. All but (3) have been systematically developed by epistemologists.

Pyrrhonism does not rely directly upon the epistemic principles discussed in the preceding section. But there are other important forms of scepticism that do. Consider this argument that can be traced to Descartes (see Descartes, R. §4):

(1) If I am justified in believing that there is a table before me, then I am justified in believing that I am not in one of the sceptical scenarios (evil demon worlds, for example) in which there is no table but it appears just as though there were one.
(2) I am never justified in believing that I am not in one of the sceptical scenarios in which there is no table but it appears just as though there were one.
Therefore, I am never justified in believing that there is a table before me.

Premise 1 is a clear instance of CLO-P. Since the argument is valid (if the premises are true, the conclusion must be true), there are only three plausible responses: (1) CLO-P is false; (2) the second premise is false; (3) the argument begs the question. Responses (1) and (2) are relatively easy to envisage; the third is not so obvious. Roughly, the argument goes as follows: since one of the potentially available grounds for my being justified in believing that I am not in a sceptical scenario is any proposition that entails that I am not in such a scenario, every good argument for the second premise would have to establish that I am not justified in believing that there is a table before me. But that, of course, is the very conclusion.

It is important to note that there is an apparently similar argument for scepticism employing the stronger epistemic principle, ET-P:

(1) If the evidence, *e*, that I have for believing that there is a table before me is adequate to justify that belief, then

it is adequate to justify the belief that I am not in one of the sceptical scenarios.
(2) The evidence, *e*, is not adequate to justify that I am not in one of the sceptical scenarios.
Therefore, the evidence, *e*, is not adequate to justify that there is a table before me.

Of course, it is open to epistemologists to deny ET-P. Since one can deny ET-P without abandoning CLO-P (because CLO-P does not entail ET-P), that certainly seems to be a strategy worth considering. The discussion in the next section provides additional reasons for considering that strategy.

9 The epistemic principles and some paradoxes

There are many epistemic paradoxes (see Paradoxes, epistemic). I here consider two in order to show how they depend upon some of the epistemic principles considered earlier.

The Lottery Paradox: Suppose that enough tickets (say *n* tickets) have been sold in a fair lottery for you to be justified in believing that the one ticket you bought will not win. In fact, you are justified in believing about each ticket that it will not win. Thus, you are justified in believing the following individual propositions: t_1 will not win. t_2 will not win. t_3 will not win.… t_n will not win.

Now if the conjunction principle is correct, you can conjoin them, ending up with the obviously false but apparently justified proposition that no ticket will win. So, it seems that you are in the awkward position of being justified in believing each of a series of propositions individually, but not being justified in believing that they are all true. Some philosophers have thought that this seemingly awkward position is not so bad after all, since there is no outright contradiction among any of our beliefs as long as the conjunction principle is rejected. But others have thought that making it rational to hold, knowingly, a set of inconsistent beliefs is too high a price to pay.

Others have suggested that we are not actually justified in believing of any ticket that it will lose; rather what we are justified in believing is only that it is highly likely that it will lose. But the lottery can be made as large as one wants, so that any level of probability (below 1) is reached. Thus, this suggestion seems to rule out our being justified in believing any proposition with a probability of less than 1. That is a very high price to pay! There is no generally agreed-upon solution for handling the Lottery Paradox (see Probability theory and epistemology; Confirmation theory).

The Grue Paradox: The so-called ‘Grue Paradox’ was developed by Nelson Goodman and has been recast in many ways (see Goodman, N.). Here is a way that emphasizes the role of ET-P:

All of the very many emeralds examined up to the present moment, t_{now}, have been green. In fact, one would think that since we have examined so many of them, we are justified in believing that (G): all emeralds are green. But consider another proposition, namely that all emeralds examined up to t_{now} are green, but otherwise they are blue. Let us use ‘grue’ to stand for the property of being examined and green up to t_{now} but otherwise blue. It appears that the evidence which justifies us in believing that all emeralds are green does not justify us in believing that (N): no emerald is grue.

What are we to make of this version of the paradox? First, note that it depends upon ET-P. Although (1) our inductive evidence (the many examined green emeralds) justifies (G), and although (2) (G) does entail (N), the inductive evidence does not justify (N). In other words, this version of the paradox arises because the evidence does not transfer as the principle would require. Second, note that CLO-P is not threatened by this paradox since it is the evidence for (G) that is inadequate for (N). (The issue is not whether we are justified in believing (N) whenever we are justified in believing that (G).)

But if ET-P were not valid, then the sting of this version of the paradox can be pulled. Recall the original Grabit case. In that case, I had adequate evidence for being justified in believing that Tom stole the book, that is, the person stealing the book looked just like Tom. It seems clear that this evidence is not adequate to justify the proposition that it was not Tom’s identical twin who stole the book. If it were the twin, things would appear to be just as they did appear to be. But this tends to show that we do not typically impose ET-P on our evidence.

There are other versions of the Grue Paradox that do not make explicit use of ET-P. For example, since ‘all

emeralds are green' and 'all emeralds are grue' are alternative hypotheses, it seems paradoxical that the very same evidence that justifies believing the first alternative also seems to support the second. But perhaps, like the version considered above, this apparent paradox rests on a mistaken intuition. Consider the Grabit Case once again. Here, the evidence which justifies the belief that Tom is the thief would also support the claim that Tom's identical twin stole the book. To generalize further, consider any hypothesis, say *h*, that is justified by some evidence that does not entail *h*. It is always possible to formulate an alternative hypothesis that is supported by that very evidence, namely (not-*h*, but it appears just as though *h* because of…). Thus, an intuitively plausible epistemic principle similar to ET-P might be invalid. That principle is: if there is some evidence, *e*, that justifies *S* in believing that *x*, and *x* is an alternative hypothesis to *y*, then *e* does not support *y*.

To sum up, if ET-P and similar epistemic principles do not accurately capture our normative epistemic practices and if the argument for scepticism that depends upon CLO-P begs the question, then the sting of Cartesian scepticism (considered in the previous section) is numbed and the Grue Paradox can be addressed. But those are big 'ifs', and the issue remains open (see Induction, epistemic issues in).

10 Some challenges to traditional epistemology

A traditional question asked by epistemologists is 'what ought we to believe?' Typically, the answer is given by (1) describing the types of reasons that contribute to warranting a belief, and (2) developing a set of necessary and sufficient conditions for knowledge in which the types of reasons depicted in (1) play a prominent role. But there are many challenges to this answer.

We have already seen the challenge developed by the causal theorists and the reliabilists. Roughly, they hold that our beliefs need not be the result of proper reasoning to be counted as knowledge. Sufficiently reliable belief-acquisition methods are all that is required. Indeed, some have held that epistemology, when done correctly, is a branch of psychology because the primary issue is the study of reliable belief-acquisition methods. This programme has often been referred to as 'naturalized epistemology' and, in one form, its basic tenet is there are no a priori knowable epistemic principles (see Naturalized epistemology; Quine, W.V.).

Another challenge to traditional epistemology comes from 'virtue epistemology', which makes the primary object of epistemic evaluation traits of persons rather than properties of beliefs or belief-forming processes. The virture approach has been taken farthest by Linda Zagzebski (1996) who proposes an epistemic theory modelled on virtue ethics and argues that such a theory permits the recovering of such neglected epistemic values as understanding and wisdom (see Virtue epistemology).

A further type of challenge is that of Edward Craig (1990). While allowing that the debate has been shaped by real features of the concept of knowledge, he rejects the project of analysing it in necessary and sufficient conditions. Instead, he tries to 'synthesize' the concept by deriving these features from a pragmatic hypothesis about its purpose, thus explaining the debate rather than joining it.

Even more radical challenges have been developed. First, some have argued that there is no unique method of acquiring and revising beliefs that ought to be employed by all people (see Cognitive pluralism). Second, it has been argued that the proposed conditions of good reasoning (for example, objectivity and neutrality) tacitly aim at something other than truth. They are developed to prolong entrenched power (see Feminist epistemology). Finally, it has been argued that successful belief acquisition occurs when the future can be adequately anticipated and controlled (see Pragmatism).

The defenders of traditional epistemology have two basic types of reply. First, they can examine the particular arguments developed by the critics to determine whether any one of them is sound. Second, they can point out that the critics will have to defend the reasonableness of their views by at least tacitly employing the very principles of good reasoning investigated by traditional epistemologists. Of course, this would not show that the critic's position is false, but it does at least illustrate the universality of the question 'what ought we to believe?'.

Knowledge, defeasibility theory of

Based upon an analogy with the legal and ethical concept of a defeasible, or prima facie*, obligation, epistemic defeasibility was introduced into epistemology as an ingredient in one of the main strategies for dealing with Gettier cases. In these cases, an individual's justified true belief fails to count as knowledge because the justification is defective as a source of knowledge. According to the defeasibility theory of knowledge, the defect involved can be characterized in terms of evidence that the subject does not possess which overrides, or defeats, the subject's* prima facie *justification for belief. This account holds that knowledge is indefeasibly justified true belief. It has significant advantages over other attempts to modify the traditional analysis of knowledge in response to the Gettier examples. Care must be taken, however, in the definition of defeasibility.*

1 Chisholm's account

The concept of epistemic defeasibility was introduced into epistemology as an ingredient in one of the main strategies for dealing with Gettier cases and other instances in which an epistemic justification for a belief fails to provide the believer with knowledge, even though the resulting belief is true (see Gettier problems). An early discussion by Roderick Chisholm noted that the problems raised by Gettier cases are analogous to problems that arise in ethical contexts. In the ethical case, we have the concept of a *prima facie* obligation, one that might be overridden. When there is a conflict between circumstances that create a *prima facie* obligation and special additional circumstances that override them, the original obligation is defeated and is no longer actual.

Building upon this notion, Chisholm defines an epistemic version of defeasibility, a concept that applies by analogy to justification for a belief. When a person's belief that *h* is *prima facie* justified by the evidence they possess, it is possible that additional evidence would undermine that justification. If this were to happen, the original justification would be defeated. Chisholm (1964: 148-9) defines epistemic defeasibility in two steps:

(1) There is a justification for *h* which has been overridden =df. There is a body of evidence *e* and a body of evidence *e′* such that *e* is true and *e* justifies *h*, and *e′* is true and the conjunction of *e* and *e′* does not justify *h*.
(2) A justification for *h* is defeasible =df. There is a body of evidence *e* such that *e* is true and *e* justifies *h* and this justification may be overridden.

The opposite of defeasibility is *indefeasibility*, which is then defined as justification which cannot be overridden.

In these definitions, it is assumed that epistemic justification is of the 'linear' variety normally associated with foundational theories of justification. This assumption is not necessary for an account of defeasibility. Defeasibility conditions can be incorporated into a coherence theory of justification (as is done by Lehrer 1990) or into a reliabilist account (as is done by Swain 1981) (see Justification, epistemic §§2-3). For ease of exposition, the linear notion of justification will be assumed here.

2 The traditional analysis and Gettier cases

The traditional analysis of knowledge maintains that a person has knowledge provided they have a justified true belief (see Knowledge, concept of). In the kind of counterexample introduced by Gettier, an individual has a justification for some true belief, but this justified true belief is not knowledge because the justification is defective as a source of knowledge. In all such cases, the individual has arrived at the justified true belief by reasoning which depends upon an essential intermediate premise which, though justified, is false. Were the falsity of this essential intermediate premise brought forth as the additional evidence *e′* in the definition (1) above, the resulting conjunction of *e* with *e′* would not justify the proposition *h*. Hence, the justification that the individual has in a Gettier case is defeasible, and this is taken to explain why the individual does not have knowledge. Specifically, the proposal is to modify the traditional definition of knowledge as justified true belief to include an additional requirement: knowledge is *indefeasibly* justified true belief. On this proposal, known as the defeasibility theory of knowledge, a justified belief will count as knowledge only if the justification cannot be overridden by the unpossessed evidence.

Consider a specific example, introduced by Keith Lehrer (1965). Suppose Smith correctly infers that (*h*) someone in his class owns a Ford from some true evidence (*e*) that justifies the false belief (*q*) that a student, Mr Nogot,

owns a Ford. It so happens that another student in Smith's class, Mr. Havit, does own a Ford, but Smith has no evidence one way or the other for this proposition. Smith's justification for *h*, which consists of *e* and his inference to *h* through the false but justified proposition (*q*) that Mr. Nogot owns a Ford, is nevertheless rendered defeasible by the true proposition *e*′, which asserts that 'Nogot does not own a Ford'. Because Smith's justification is defeasible, he does not know that someone in his class owns a Ford. All Gettier cases have essentially this same structure, and so the defeasibility theory provides a general solution to the problem they pose for the traditional analysis of knowledge.

3 Advantages of the defeasibility approach

The defeasibility theory has advantages over other, simpler, proposals for modifying the traditional analysis of knowledge in response to Gettier cases. For example, the traditional definition can be revised to require that one's justification not involve or depend essentially upon any false intermediate premises. Or, the definition of epistemic justification can be strengthened to require that only true beliefs can be epistemically justified, blocking the move through (*q*) in the above example. However, these alternative solutions, which are aimed at specific features exemplified by Gettier cases, do not result in an acceptable general account of knowledge. There are examples which show that the traditional analysis fails even when all the evidence, essential intermediate lemmas and final conclusions involved in the justification of a belief, are true. The defeasibility analysis of knowledge has the merit of providing an adequate account even in these additional examples.

One illustration of the merits of the defeasibility account of knowledge over others is the well-known 'Barn Facsimile' example introduced by Alvin Goldman (1976). A subject, *S*, is looking at a barn under normal conditions of perception. *S* comes to believe, correctly, that there is a barn there on the basis of the perceptual evidence gained by looking at the barn. It may be assumed that all of *S*'s essential evidence is true, *S* correctly infers that there is a barn present in a manner that does not depend upon any false propositions, and *S* arrives at a true belief. Even so, *S* does not know that there is a barn there because of unusual surrounding circumstances. Unknown to *S*, the neighbourhood is populated by a number of structures which consist only of barn facades propped up by sticks. The only real barn in the neighbourhood is the one that *S* happens to see, and it is just by chance that *S* is perceiving that structure rather than one of the façades. Had *S* perceived a façade rather than a barn, *S* would have mistaken it for a real barn. All efforts to modify the traditional analysis of knowledge by disallowing justifications that depend essentially upon false beliefs will fail to rule out this example, since there are no false beliefs involved. The defeasibility account gives the right answer, however, for in this case the subject's justification is rendered defeasible by the availability of the true proposition *e*′, which asserts that 'Virtually all the things in this neighbourhood that look like barns are actually barn facades'.

4 Problems facing the defeasibility approach

Perhaps the most serious problem facing the defeasibility account, as it is expressed in the definitions (1) and (2) above, is the existence of examples in which there are special circumstances that would override a subject's justification even though that justification is not defeasible. As formulated, the account of defeasibility is too strong. This phenomenon is illustrated in the well-known example of Tom Grabit, presented by Lehrer and Paxson (1969). Suppose you observe your friend, Tom Grabit, in the act of stealing a book from the library. You know Tom well, and have no doubt whatever that it is Tom who stole the book. Your belief is true, your evidence is true, and your justification does not essentially involve any false beliefs. It would seem obvious that you have knowledge. Unknown to you, however, Tom's mother, upon hearing that her son has been arrested, fabricates a lie: she tells the police that it could not have been Tom, for Tom is in some other city. Instead, she says, it was almost certainly Tom's twin brother Tim, who is a kleptomaniac. But there is no twin brother; it was in fact Tom who stole the book. Given this scenario, your justification will be rendered defeasible by the availability of the true proposition *e*′, which asserts that 'Tom's mother says Tom was out of town at the time of the theft'.

Several modifications of the defeasibility theory have been suggested that would make it sensitive to such examples of apparent or pseudo-defeasibility. Gilbert Harman (1973) suggests that we make a distinction within the class of potentially undermining counter-evidence - evidence that would qualify as overriding by (1) above - between that which is genuinely defeating and that which is not. Then, undermining evidence will prevent knowledge only if it is genuinely defeating, as it is not in the case of Tom Grabit. Unfortunately, Harman left the

distinction between genuine and non-genuine defeating counter-evidence undefined.

Another proposal, made by David Annis (1973), suggests a distinction between genuinely defeating and 'merely misleading' counter-evidence. In the Grabit example, the mother's testimony is merely misleading and not genuinely defeating. Although this proposal has considerable intuitive appeal, Annis was not able to provide a generally accepted account of the key notion of 'merely misleading' counter-evidence. An attempt to make this distinction precise was made by Peter Klein (1980 and 1981), who suggests that the misleading effect of a defeater such as the one in the Grabit example is explained by the fact that it depends essentially on a false proposition. In genuine defeat, the defeater does not so depend. This proposal may prove to be adequate, although there is some debate about the notion of essential dependence.

Yet another proposal, suggested by Barker (1976), Swain (1974, 1981), Lehrer (1990) and Pollock (1990), attempts to take into account the defeasible nature of the defeasibility relation itself. In judging whether a subject's justification is defeasible, it is a mistake to consider isolated members of the total body of unpossessed evidence which is available to the subject, as is encouraged by (1) and (2). In many cases, such as the Grabit example, a justification's apparent defeat is itself only *prima facie*. It is itself defeated by further unpossessed evidence or special circumstances. The apparently defeating effect of the mother's testimony is itself overridden by the additional circumstance that she is lying. The final answer to the question of defeasibility of a justification in a given situation can only be arrived at when all of the relevant available counter-evidence, countervailing counter-evidence and so on, is taken into account. If a justification still holds when all the special circumstances are taken into account, it is said to be 'ultimately undefeated'. In the Gettier cases, the barn-facsimile example and other cases in which the subject genuinely lacks knowledge, their justification is ultimately defeated. In genuine cases of knowledge, even if some isolated undermining counter-evidence is available, the subject's justification will be ultimately undefeated.

This final proposal has also come under critical attack. Klein has argued (1980, 1981), for example, that even in cases of genuine defeat it will turn out that the justification is ultimately undefeated, since the 'original', or target proposition is true. Given these various disagreements, it seems fair to say that the defeasibility theory remains one of the most viable alternative approaches to the analysis of knowledge, but that there is no unanimity concerning the best way to handle the misleading defeater cases.

Knowledge, Indian views of

Classical Indian epistemology centres on a complex of terms for knowledge, knower and the known or knowable, including pramāṇa*, 'means to knowledge' or 'source of knowledge'. Views about perception, inference, testimony and a few additional candidate sources are the topics of core proposals of competing epistemological theories. Certain types of scepticism are also addressed, but explaining how it is possible that we know anything has been less central than other issues. Debates about knowledge - and doubt as well - are often caught up in larger war plans concerning the nature of awareness.*

The various classical schools typically bring views about awareness with them to the epistemological arena, but a neutral, common touchstone for and important constraint on all pramāṇa *theorizing is what is called speech behaviour,* vyavahāra*, reflecting, it is presumed, bits of everyday knowledge. Verbalizations of perception, for example, 'That is a pot', of inference, for example, 'There is fire on yonder mountain' (made on the basis of the sight of smoke and an understanding of the general rule that wherever there is smoke, there is fire), of information acquired through testimony, and so on, are the givens for which a successful theory has to account.*

Principal candidate sources proposed in addition to perception and inference are testimony, analogy, circumstantial implication and negative perception. Mystical experience as a pramāṇa *for spiritual matters is viewed as a variety of perception by its advocates, and scripture as a variety of testimony. With stock examples of bits of knowledge agreed upon, disagreement typically centres on what the source is for a particular example and whether admission of any source in addition to perception and inference is ever required. Or, in some cases, a stock example is slightly modified, better to align with a stance taken on a putatively additional* pramāṇa*.*

With regard to what the sources make known, some argue that each pramāṇa *works within a range of possibilities unique to itself, with no overlap. Thus what is known by perception cannot be known by inference. Others dispute such contentions, although at least a few such restrictions on individual knowledge sources are usually recognized. Buddhists and some others appear to be motivated to deny* pramāṇa *status to testimony because appeal to testimony is used to justify what they see as objectionable religious theses. Similarly, the Cārvāka materialist denies inference, apparently out of fear of its power to prove the existence of spiritual entities such as God or the soul.*

The Buddhist Nāgārjuna and others challenge the pramāṇa *programmes proffered by epistemologists of all stripes, and provoke what may be called meta-epistemological responses that bring out connections between* pramāṇa *proposals and a logic of presumption. In particular, the Nyāya response to Nāgārjuna and company is by any light an admirable effort of philosophy.*

1 Awareness, knowledge and doubt

In the classical Indian context, knowledge is treated as a species of awareness or cognition (*jñāna*), not of belief. A common opinion is that only a verbalizable or propositional awareness can be a bit of knowledge, and the examples of bits of knowledge talked about by classical epistemologists are expressed as sentences. For instance, the sensory awareness 'That is a pot', when a cognizer is perceptually presented with a pot, would, on most views, count as a bit of knowledge, although some theorists would object to this way of framing the matter. Awarenesses normally form beliefs in that there is - again, most would agree - a causal relation between an awareness and a memory or, more precisely, a 'disposition', *saṃskāra*. This reverberates with contemporary dispositional analyses (roughly: *A* is *S*'s belief if and only if *S* would answer certain questions in certain ways or behave in certain ways). Still, the bits of knowledge focused upon by classical Indian epistemologists are not beliefs but cognitions or awarenesses - right cognitions and veridical awarenesses.

Inferential knowledge is also an awareness, as too is knowledge acquired from any of the more exotic (and disputed) sources. Those who have become accustomed to talking about arguments in terms of propositions or sentences have to guard against imposing a nonpersonal understanding upon Indian discussions of logic in particular. Unlike in Western treatments, inference is not abstracted wholesale out of the context of persons who make inferences. The result of a good inference is an inferential awareness, a proposition-laden cognitive event arrived at by a process of understanding that such-and-such is the case because such-and-such else is the case. In

practice - that is to say, in the context of philosophical discussion and debate - there is, to be sure, abstraction from actual situations of knowing; otherwise, epistemology would be impossible since it is, at least normally, a discourse about cognitive events other than those provoked or reflected by the discourse itself (although self-referential, or meta-, epistemological discourse does occur: see §4). But the personal context is not lost sight of.

Another presupposition of classical Indian epistemology that is often missed or considered strange by those weaned on Western materials is the assumption that awareness, and thus knowledge, is episodic in character. In Plato’s *Meno*, Socrates argues that part of the value of knowledge is its steadfastness: *justifiable* true belief cannot be easily unpegged. One must keep in mind that ‘knowledge’ as used in the present entry renders a Sanskrit term, *pramā*, whose meaning has been the focus of extensive probing and controversy, comparable to the amount of philosophical attention knowledge has received in the West. There is no single English term or phrase that captures precisely the meaning of any of the family of Sanskrit words rendered here as ‘knowledge’, ‘knower’, ‘source of knowledge’, and so on. Many contemporary philosophers have detailed opinions about just what knowledge is, and so to render *pramā* as ‘knowledge’, for example, or *pramāṇa* as ‘source of knowledge’ may be especially to invite misunderstanding. The classical Indian approach to epistemology and translations such as ‘knowledge’, ‘knower’, and so on, have, however, been ably defended by several scholars and philosophers, most notably by Bimal Matilal (1986), who argues that to have knowledge in the episodic sense is a necessary (though not a sufficient) condition for knowledge in the sense of (roughly) a justified true belief. A belief not acquired through a reliable means will not count as knowledge. Classical Indian epistemologists focus on the event that is, one might say, the first formation of a bit of knowledge. With many, *pramāṇa* is to be understood both as evidence and as proximate cause of the first formation of any bit of knowledge - to use the term ‘knowledge’ in the nonepisodic sense. The dispositions required for reactivation or later use of a knowledge episode are not ignored by classical epistemologists. But again, the primary focus is on knowledge as an episode.

Doubt is also a cognitive episode or awareness, and it arises in specific situations whose general features we may become apprised of - this is another task of epistemology as practised in classical India. The *Nyāyasūtra* (*c.* AD 150; although it did not reach its present form until about 400), for example, says that doubt arises when, about the same object or topic, (a) there is insufficient information to determine what something is among things sharing common characteristics (for example, a post or a person in the distance), (b) there is insufficient information to determine what something is among things fundamentally distinct (for example, whether sound is a substance, quality or motion), (c) contradictory assertions are made and (d) there is inconstant information (for example, there seems to be water in the distance and then there does not). In this way, the *Nyāyasūtra* embraces a project of articulating conditions of meaningful doubt, a project that becomes much advanced during the following centuries. Philosophers of the Nyāya school take it to be a knockdown argument against a position that it provokes irresolvable doubt, and no school, not even Nāgārjuna’s Mādhyamika, which is famed for its scepticism about philosophy (see §4), holds doubt to be anything like a foundational, or natural, philosophical position. Doubt is a cognitive event that arises under certain conditions.

2 Candidate sources

Perception, inference and testimony are treated elsewhere (see Sense perception, Indian views of; Inference, Indian theories of; Testimony in Indian philosophy). So also is the issue of how negative facts are known (for example, Devadatta’s not being at home or the absence of my glasses on the table), and whether they are known through a special *pramāṇa* (see Negative facts in classical Indian philosophy). The present entry will air arguments surrounding the candidate sources of analogy and circumstantial implication. The question of mystical experience as a possible source of knowledge about spiritual matters is assimilated in classical discussions to the epistemology of perception.

An example commonly used of knowledge acquired through *upamāna*, ‘analogy’, is, according to Nyāya, as follows. A knower *S* has been informed by a forester that a *gavaya* (a kind of ox, *Bos gavaeus*), a species with which *S* has had no prior acquaintance, is similar to a cow except for certain differences that the forester spells out. *S* proceeds into the forest and encounters a *gavaya*, recognizes it as the animal the forester said was similar to a cow and shows the recognition by saying ‘Hey, a *gavaya*!’ Philosophers of the Nyāya school hold that *S* acquired a new piece of vocabulary (a bit of knowledge) through the analogy drawn by the forester, as shown by *S*’s correct

use of the word *gavaya* to designate the animal commonly referred to by that name.

Two principal contrary positions are, first, that what is known in such cases is not a new piece of vocabulary but a similarity, which, according to some but not all those who so endorse the *pramāṇa* status of *upamāna*, is a distinct category of the real. A second camp denies *pramāṇa* status to analogy no matter how understood; that is to say, analogy is no additional source of knowledge and the cited examples of knowledge from analogy are to be understood as examples of knowledge from testimony (in so far as testimony is itself an irreducible source) or perception or inference or a combination of these.

According to the Mīmāṃsāschool, which is intent on explaining and defending Brahmanical rituals, *upamāna* is the source for knowing the similarity of two things - a particularly useful bit of information when a substitute has to be found to complete a sacrifice or other ritual performance. For example, wild rice (*nīvāra*) can be substituted for domestic rice (*vrīhi*) because of their similarity. Also, when scripture does not elaborate the details of the performance of a particular rite *X* that is similar to rite *Y*, then rite *Y* can be used as a model for the performance of *X*. In the Mīmāṃsaka version of the stock example (which probably predates that in Nyāya), a knower *S* sees a *gavaya* and is reminded of a cow: 'Similar to this is my cow.' Analogy is said to be the proximate cause of knowledge of such a similarity. Against the arguments of Buddhists and others who hold that no special source need be postulated, Mīmāṃsakas respond by pointing out peculiar features of what is made known, along with strictures (some recognized by their opponents) on the range of operation of perception and inference.

It is difficult to see what motivates the Nyāya endorsement of analogy, since, as some of that very persuasion (such as the tenth-century philosopher Bhāsarvajña) insist, testimony and perception appear sufficient to account for vocabulary acquisition, at least in the stock example. Advaita Vedāntins, in contrast, have clear and substantial motives for endorsing analogy as understood roughly in the Mīmāṃsaka fashion: the true Self (*ātman*), as declared in scripture, is known as eternal, all-pervasive and unattached *like the sky*, and not as perishable, limited and prone to attachments - that is, it is known to be *unlike the body*. Such comparisons are grounded in facts that only the special source of analogy is capable of conveying. The Self is best or directly known in a meditative or mystical experience; no knowledge source, not even the testimony of scripture, operates except within the conditions of spiritual ignorance, *avidyā*, that are transcended in direct Self-experience. Nevertheless, scripture does refer to similarities and dissimilarities to help the mystic aspirant. So convinced, some late Advaitins speculate at length on the peculiar power of analogy.

Circumstantial implication, *arthāpatti* (sometimes rendered 'presumption'), is held to be another special and irreducible source according to Mīmāṃsakas and Vedāntins, and a type of inference according to most other disputants. Two stock examples are: (a) from discovery that Devadatta is not in his house it is known by implication that he is outside, and (b) from testimony about fat Devadatta that he does not eat during the day it is known by implication that he eats at night.

Kumārila (*c.*650), a Mīmāṃsaka with an extraordinary breadth of interest and the founder of one of two principal Mīmāṃsāsubschools, is often cited for his views on *arthāpatti* by philosophers of all persuasions. He lists six types of circumstantial implication according to how the critical circumstances are known, that is, according to the six sources identified by his school: perception, inference, analogy, circumstantial implication (making known the crucial circumstances in the present case, although the circumstances leading to it may be known differently), negative perception (the source for knowledge of absences) and testimony.

As comes to be common practice for wide-ranging philosophers of almost all points of view, Kumārila finds use for *arthāpatti* in establishing positions in ontology and metaphysics. Some modern commentators have seen *arthāpatti* as a pattern of reasoning commonly employed in the system-building typical of both Western and Eastern metaphysics, namely, reasoning to a vaunted best explanation. The best explanation of the information that fat Devadatta fasts by day is that he is a glutton at night, though there are other possibilities. Similarly, a Nyāya philosopher will argue against a Buddhist nominalist that postulation of real universals does a better job of explaining certain generalities or recurrences of experience than the Buddhist theory does. However, Kumārila and others seem to hold (it is probably Prabhākara, Kumārila's pupil and rival, and founder of the second principal Mīmāṃsāsubschool, who had the insight originally) that what makes *arthāpatti* effective is the absence of all other (live?) explanatory possibilities. (Prabhākara adds a proviso, disputed by the Kumārila camp: the absence of other explanatory possibilities in a given context of inquiry.) In reasoning to the best explanation, on the other hand,

alternatives are presumably admitted. Of course, there is no modal logic in classical Indian thought informing such reflections (until in a sense in very late New Logic, according to Sibajiban Bhattacharyya (1987)); we should avoid reading too much into classical discussions of albeit interesting examples. In any case, controversies in other domains, such as the basic categories of reality, come to bear on philosophers' understanding of *arthāpatti* - as they do too in particular with perception among other candidate sources.

Nyāya philosophers and others argue that circumstantial implication is a form of inference: roughly, from the premises (1) Devadatta is fat, (2) whoever is fat eats either at night or during the day, and (3) Devadatta does not eat during the day, one infers (4) Devadatta eats at night. In terms closer to the Sanskrit locutions used to express inferences, the invariable concomitance or pervasion, *vyāpti*, between occurrences of properties *F* and *G* that would underpin inference in this case would be: any person not eating at night or during the day exhibits absence of fatness (whatever is not-*G* is not-*F*).

3 Object-wise restrictions

Another important feature of classical Indian epistemology is the tendency to find restrictions governing the operations of individual knowledge sources, restrictions tied to the nature of the objects the sources reveal. Although objects are made known only by sources, knowing them we are apparently led to a view of epistemic limitations. And the individual sources themselves, it should be pointed out, can be objects of knowledge, at least according to the most prominent views.

Mīmāṃsāsūtra 1.1.4 presents an argument against perception's being the source of ethical knowledge: perception apprehends only what *already exists*, whereas ethics - *dharma* in Sanskrit, 'right practice' - is comprised of what one *should do*. The nature of *dharma* precludes perception as the knowledge source. Thus in so far as ethical knowledge is presumed, its source must be other than perception. It is, according to Mīmāṃsā, scripture, the Veda, interpreted as a list of injunctions prescribing what we should do. In this way, a limitation of perception concerning something presumed knowable (*prameya*, 'object of knowledge', in this case *dharma*) is used as a way to defend the authority, the *pramāṇa* status, of scripture.

Disputes between Nyāya realists and Buddhist Yogācāra idealists centre on conflicts over perception and inference. Object-wise distinctions shore up a Yogācāra partitioning of the two *pramāṇa*: there are unconceptualizable individuals on the one hand, and concept-fused generalities on the other. The Yogācārin Dignāga (§1) says:

> Now the means of cognition are [immediate and mediate, namely] perception and inference. They are only two, because the object to be cognized has [only] two aspects. Apart from the particular and the universal there is no other object to be cognized, and we shall prove that perception has only the particular for its object and inference only the universal.
>
> (*Pramāṇasamuccaya* 1.B)

And he goes on to present several considerations that bear on - or that elaborate - a rather trenchant division (see Buddhism, Yogācāra school of §§1-4). Nyāya, in contrast, finds universals such as cowhood as well as individuals such as Bessie the cow to be known perceptually. Inference is seen as dependent on perception in specified ways but also as filling out what is perceptually known, and a single object, such as a fire, can be known by perception or by inference or by both (or, indeed, by testimony) (see Nyāya-Vaiśeṣika §§5-6). Inference is dependent on perception both in that it is perception that establishes a required general thesis (paradigmatically, wherever there is *F*, there is *G*) and in that every inference, in providing knowledge of the world, is said to have to have - to get started, so to speak - a perceptually warranted premise. For example, from the sight of smoke rising from a hill, it is known by inference that there is fire there, too. (Several Nyāya philosophers point out that testimony can substitute for perception here, since, for example, we can be told that there is smoke on a hill and infer fire.) Dignāga and his school view inference as operating in a world of concepts or generalities all of its own, with the role of perception in concept formation as negative, as excluding (*apoha*) or ruling out what proves unpragmatic. To label Bessie a cow is to impose a generality of the mind on her unique particularity, a generality that, all things considered, is nevertheless better than its negation, a non-cow, with the opposition of cow and non-cow understood as a law of logic, not, as in Nyāya, a natural opposition, an incompatibility in the world (see Epistemology, Indian schools of §1).

The topic of object-wise restrictions on individual sources looms large in still other schools. Saōkara (*c*.700) presents an argument (probably inspired by the Mīmāṃsaka move respecting *dharma*) to shore up an Advaita absolutist metaphysics: proclamations of scripture (the Upaniṣads) have exclusive authority within their own province, namely, the reality and nature of Brahman, the Absolute (*Brahmasūtrabhāṣya* 2.1.1). Thus no evidence derived from perception, for example, could conflict with what the Upaniṣads say of Brahman. Similarly, the Upaniṣads cannot dispute perceptual evidence about objects in the world. Indeed, Saōkara holds that 'It is not the case that one source of knowledge (ever) opposes another source, for the one source makes something known that is not at all an object of the other' (*Bṛhadāraṇyakabhāṣya* 2.120). One wonders, however, whether Saōkara intends a position, like that of Yogācāra, according to which the perceptible and the inferable are distinct realities, or whether he intends only to stress (by exaggeration) the separate domain of scriptural authority.

Later Advaitins follow Saōkara's apparent endorsement of partition, at least in part. Dharmarāja (*c*.1600), the author of a popular Advaita textbook with an epistemological slant, holds for instance that the inferential cognition 'The hill is fiery' is perceptual and immediate with respect to the 'hill portion' but conceptual and mediate with respect to the 'fiery portion' (*Vedāntaparibhāṣā* 1.31). In Nyāya, it is insisted that we can touch what we see, and that even a cognition such as 'I see fragrant sandalwood' is legitimately deemed perceptual with respect to the property of being fragrant as well as with respect to the sandalwood. The relation between the grasping organ and the grasped property is said to be 'extraordinary'. The relation, or process, involves memory, as in the case of illusion, but the property is none the less perceived. Dharmarāja says, in contrast, that the sense of sight is not capable of grasping what is smelled. Nyāya philosophers agree with their adversaries that the organs of hearing, taste and smell are confined to sounds, tastes and odours respectively, and that depending on the precise nature of what is to be known there are restrictions on the other faculties. But they maintain that sight and touch range rather unrestrictedly over most properties most things exhibit, as do also the knowledge sources of inference and testimony.

4 Scepticism and epistemology

Focused, as explained, on the nature and number of knowledge sources, classical Indian epistemology met with scepticism practically from its inception. The Buddhist Nāgārjuna (*c.* AD 150) asks how - supposing that the known becomes known through *pramāṇas* - the *pramāṇas* themselves are established: 'If the *pramāṇas* are established through other *pramāṇas*, then there is an infinite series [and] neither the beginning nor the middle nor the end can then be established' (*Vigrahavyāvartani* 32-3). Next he explores two metapositions, finding neither satisfactory: (a) a foundationalist stance and (b) a view of a reciprocal making-known, with objects taken to be sources for knowing the usual sources as well as the reverse. Against the former view, which is expressed by an analogy to fire's illuminating itself along with other things, Nāgārjuna argues that, first, fire does not illuminate itself - as though it existed in darkness - and, second, if *pramāṇas* are self-established, without relation to objects made known (*prameyas*), then they are *pramāṇas* of nothing. Against the latter view, which specifies that the *pramāṇas* are established as *pramāṇas* in relation to the objects they make known (*prameyas*), he says that without being first established itself, nothing could establish another. A son is incapable of begetting his father. Thus all *pramāṇa* programmes are bankrupt.

In the *Nyāyasūtra* and commentaries, a response to such epistemological scepticism is forged whose linchpin is a view about the burden of proof and the relevance of citing *pramāṇas* varying according to specific contexts of inquiry. Consider what you would do if you were worried about the correctness of a scale used to weigh gold, says Vātsyāyana (5th century) in commenting on *Nyāyasūtra* 2.1.16, 'as a scale can be an object of knowledge as well'. According to this earliest *Nyāyasūtra* commentator, you would take a piece of gold to another scale, or to two or three other scales, determine its precise weight and bring it back to calibrate the scale in question. What was formerly an instrument for determining the weight of gold - thus a *pramāṇa*, in the sense that the scale is what is consulted about weight - becomes what is to be made known, *prameya*, in this special instance. Similarly, a piece of gold, which was the object of knowledge, becomes a source of knowledge. There is no rule that a specific instance of operation of a knowledge source - whether perception or inference or whatever - may not itself become the object of inquiry. In that case, some other instrument or knowledge source would be employed.

The complete Nyāya response to Nāgārjuna includes four further points. First, the threat of an infinite series is faced by a purported willingness to try to provide answers as long as there are meaningful questions. Second,

infinite series, it is pointed out, do occur, for example, a seed, a sprout, a seed, and so on. If you want us to answer the question as to what stands at the end of the series, say Nyāya philosophers, then we say that your question is framed in confused terms, that there is no possible answer: infinite series have no ends. We will consider issues of justification as far back as you wish, but - and here is the first point again - doubt has to be meaningful (see §1). Thus Nyāya philosophers assume that the balance of *reasonable* doubt is not tipped against them. Third, if the question is what justifies the entire *pramāṇa* programme, the answer is inference based on an invariable concomitance which itself is known from wide experience of the success of action guided by awarenesses whose sources are perception, testimony, and so on. If the basis of this and all inference is challenged, it is pointed out - fourth and finally - that to argue against *pramāṇas* is self-defeating, for what could be the source of one's argument? In particular, Gaōgeśa (*c*.1325) counters that the sceptic who opens his mouth to attack the foundation of inference, namely invariable concomitance (or *vyāpti*, 'pervasion'), commits a pragmatic contradiction, for his behaviour shows that he assumes that there is such a concomitance between speaking and communicating to another. Similarly, the sceptic who presents an argument against inference as a *pramāṇa* cannot be in good faith.

Knowledge, tacit

Tacit knowledge is a form of implicit knowledge we rely on for both learning and acting. The term derives from the work of Michael Polanyi (1891-1976) whose critique of positivistic philosophy of science grew into a fully developed theory of knowledge. Polanyi believed that the 'scientific' account of knowledge as a fully explicit formalizable body of statements did not allow for an adequate account of discovery and growth. In his account of tacit knowledge, knowledge has an ineliminable subjective dimension: we know much more than we can tell. This notion of tacit knowing in science has been developed by Thomas Kuhn, has figured prominently in theoretical linguistics and has also been studied in psychology.

Polanyi maintained that at each stage of scientific inquiry, from discovery to confirmation, a crucial role is played by experience, skill and expertise, each of which involves a kind of knowing on the part of the practitioner which is implicit and unformalizable. His distinction between tacit and explicit 'knowledge' is grounded in his distinction between subsidiary and focal 'awareness'. Drawing on Gestalt psychology's account of perceptual integration, whereby we are perceptually aware of the coherent whole to which we are attending on the basis of a subsidiary awareness of details or clues to which we are not attending, Polanyi develops a general account of awareness wherein our focused awareness of *B* is a function of our subsidiary awareness of *A* (see Gestalt psychology). The tacit integration of the subsidiary elements that makes possible our explicit recognition of the perceptual object becomes a model of a kind of implicit knowing that lies at the heart of our cognitive orientation to the world. This generalization is driven by the conviction that such tacit knowledge is basic to our understanding of language and to comprehending any complex situation. For Polanyi, tacit knowledge is not just one kind of knowing we are capable of; it is absolutely fundamental: 'all knowledge is either tacit or rooted in tacit knowledge' (1969: 144).

The feature of tacit knowledge that bears on knowing more than we can tell is both crucial and ambiguous. The distinction between subsidiary awareness and focal awareness seems to be merely functional in that items of subsidiary awareness in this experience can be objects of focal awareness in the next. Is the same true of the tacit-explicit distinction? Is it simply the case that all explicit knowing is rendered possible by a shifting background of implicit knowing, or are there some kinds of knowledge which are (at least for us) in principle non-explicit? On the weak interpretation 'knowing more than we can tell' is time-indexed and seems uncontroversial, whereas the strong interpretation invokes a species of knowledge shrouded in mystery. Recent attempts to construct computer programmes that would replicate the skills that involve tacit knowledge could shed light on the '*de facto*' versus 'in principle' character of the tacit-explicit distinction.

The basic notion that there is a dimension of scientific knowledge that is acquired only through practice and that cannot be (or is not) articulated explicitly has been developed in Thomas Kuhn's account of both normal and revolutionary science (see Kuhn, T.S. §§2-3). The recognition of what is significant in theoretical and experimental situations so fundamental to the conduct of science is learned in actually doing science rather than by the acquisition of rules for doing it. In these basic procedures the scientist has no direct access to what is known, nor generalizations in which to express it, but inasmuch as it is an ability that is transmitted through education it seems appropriate to categorize it as knowledge, albeit of the tacit variety. The distinction invoked here encompasses but is not exhausted by that articulated by Gilbert Ryle (1949) in terms of 'knowing how' and 'knowing that'. This tacit knowing which functions so pervasively in normal science also plays a critical role in those creative advances characterizable as scientific revolutions (see Knowledge, concept of §1).

The notion of tacit knowledge also figures prominently in theoretical linguistics. The debate in this area has been between the empiricist tradition (which construes language as an adventitious construct built up in a basically inductivist manner by elementary data-processing procedures) and the rationalist tradition (which maintains that behind these processing mechanisms there must be innate formal and substantive linguistic universals built into the language user to account for both acquisition and competence). The principal figure in the rationalist tradition has been Noam Chomsky and his theory invokes the notion of tacit knowledge. He argues that since the knowledge of a language involves the implicit ability to understand indefinitely many sentences, it seems reasonable to attribute to the competent speaker the grasp of a system of linguistic rules that can generate an indefinitely large number of structures. These rules are obviously not explicitly known by the speaker, but the tacit knowledge of them seems

necessary to explain not only competent performance but, in particular, the ability to learn any natural language (see Language, innateness of).

Much work has also been done in experimental psychology bearing on the notion of tacit knowledge. This research usually goes under the rubric ‘implicit versus explicit cognitive processing’ and is normally construed as mapping on to the unconscious-conscious distinction. Implicit learning and implicit memory have been the subjects of numerous studies and there seems to be considerable evidence, particularly from the study of amnesia patients, that implicit cognitive processes are more robust than their explicit counterparts. Given the emergence of cognitive science as a basic research programme, both in experimental psychology and philosophy, there has been a recent cross-fertilization of the inquiry into notion of tacit knowledge.

Knutzen, Martin (1713-51)

Martin Knutzen was a follower of Christian von Wolff. His work is the result of an effort to reconcile Wolff's system, more persuasively than Wolff himself had, with common sense, Christian faith and the latest results in the natural sciences. Because Wolff had come under fire from Christian Pietists for apparently trying to resurrect Leibniz' system of pre-established harmony, thereby possibly flirting with Spinozism and therefore atheism, Knutzen argued from Leibnizian premises that real interaction is at work in the world at large and is constitutive of the mind-body union. Knutzen was Kant's teacher.

Knutzen was born in Königsberg, East Prussia, the only child of a humble Danish merchant. Orphaned at the age of six, he was cared for by a relation who saw to his education. At fifteen, Knutzen entered the University of Königsberg where he developed an interest in the natural sciences and made two lifelong and apparently incompatible commitments: to Pietism, and to the philosophy of Christian von Wolff. Much of Knutzen's later philosophical work can be understood as an effort to reconcile these two commitments. At twenty one, he became professor extraordinary of logic and metaphysics at Königsberg. In spite of this brilliant debut, he never rose to the higher rank of professor ordinary. Knutzen was said to be an engaging lecturer. At any rate, he was a very busy one, teaching as many as six hours a day. In addition, he wrote much on philosophy, the natural sciences and theology.

Wolff had made the philosophy of Leibniz fashionable again by packaging it as an easy-to-digest system. The system was appealing, because it offered a comprehensive picture of God, the world, the human soul and things in general by elaborating the consequences of two principles: the law of contradiction and the principle of sufficient reason. As the system won followers, it came under critical scrutiny. Pietists attacked it for blasphemy, arguing that it reduced to Spinozism and thus to atheism (see Spinoza, B. de). Friends of common sense within and without the school reacted against the eccentric aspects of Leibniz' thought. Wolff's followers set out to reconcile the system more persuasively with Christian faith, common sense, and the latest results in the natural sciences. Knutzen was one of the most eminent of these innovating Wolffians.

A great stumbling block in Leibniz philosophy for common sense, and, in the eyes of some, for Christian faith, is the doctrine of pre-established harmony. According to this, no real interaction occurs among created substances. Every monad is itself the author of every change it ever undergoes. The appearance of interaction is the effect of God's having arranged things so that change in one substance would always arise in concert with change in every other. The doctrine also denies real interaction between body and soul (see Dualism). Their intimate union is the effect of selfproduced change in each, harmoniously pre-established by God. This doctrine was attacked by pietists, who complained that it represents the soul as a spiritual automaton, fatalistically spinning out its future under the principle of sufficient reason, and impiously absolves us of responsibility for our sins. But the doctrine met with hesitation even within the school, notably from Knutzen who tried to show, from Leibnizian premises, that interaction must be at work in the world, not pre-established harmony.

Knutzen's argument for real interaction borrows the following ideas from Leibniz as understood by Wolff: every body is composed of monads; every monad produces change in itself; by reason of their changing inner states, monads externally relate to one another. Since selfproduced change in one monad alters its external relations with other monads, they are also affected by such change; real interaction must therefore take place among the monads. There must also be real interaction between body and soul, argues Knutzen, because the soul is a simple substance. We may therefore expect the soul to interact with the monads, constitutive of the human body, just as these monads interact with one another. Real interaction of soul and body is properly understood as real interaction of soul and monads.

Leibniz had also argued that body-soul interaction would disturb the order of nature determined by the laws of motion, given that the total quantities of motion and 'living forces' in the world are always conserved. Knutzen agrees that we must reject any system of mind-body union which can be shown to disturb the order of nature. But he denies that, properly understood, this would ever be disturbed by real interaction. The order of nature, he says, is established by the set of rules that govern different forces in the world. But any given rule operates only under certain conditions. Knutzen says that the law of conservation of living forces holds only for bodies mechanically

interacting amongst themselves. If a body interacts with a soul, neither it nor the soul, which is immaterial, is subject to this conservation law. Interaction may therefore take place between them without disturbing the order of nature. Furthermore, Knutzen draws a parallel between the law of conservation of living forces and the law of conservation of motion. Like the former, the latter operates only under certain conditions, namely in the ideal case of collision between perfectly elastic bodies, which never obtains in the world. Since both conservation laws are restricted in important ways, their jurisdiction over nature is curtailed, leaving open the possibility of real interaction.

Perhaps due to the isolation of Königsberg, Knutzen was not renowned even in his day, though he was well known to figures more familiar to us than he himself is, such as Hamann and Kant. Knutzen's philosophy and lectures apparently influenced the latter, to whom they may have suggested the idea of reconciling Leibnizian metaphysics and Newtonian natural philosophy, as, for example, in Kant's dissertations of 1755-6.

Kojève, Alexandre (1902-68)

Alexandre Kojève developed an idiosyncratic and widely influential reading of G.W.F. Hegel in a seminar in Paris from 1933 to 1939. Kojève read Hegel as having discovered that truth was the product of history, and that history was the product of the human desire and struggle for recognition. Kojève emphasized that once this desire was satisfied, history, properly so-called, was over. He claimed that for all essential purposes this human desire had been satisfied in the modern period, and thus that we had experienced (and Hegel had come to know) the end of history. The notes from this seminar were published in 1947 and continued to have an important impact on French philosophy throughout the post-war period.

1 Life

Kojève (born Kojèvnikoff) left Moscow at the age of 18, and spent most of the 1920s in Berlin and Heidelberg. During his years in Germany, he was strongly affected by the teaching of Martin Heidegger and by his fellow students in philosophy, Jacob Klein and Leo Strauss. By 1927 he had come to Paris, where he would give his Hegel seminar as a replacement for his friend, Alexandre Koyré. After the Second World War, Kojève worked as a negotiator and advisor for the French Ministry of Economic Affairs (especially on world trade matters). He continued to write on philosophy in his spare time.

2 The end of history

Kojève's early writings, especially those on the mystical philosophical texts of Vladimir Solov'ëv, show a concern with finding legitimate criteria for making sense of historical change. If these criteria were themselves the product of historical change, how could stable philosophical knowledge be possible? Kojève's idea of the 'end of history' (which he attributed to Hegel) was meant to answer this question.

Kojève acknowledged his departure from Hegel in his sharp separation of the natural from the historical. Kojève was interested only in the latter, and used the master-slave dialectic as a schema for understanding the stages of work and struggle in history. In this schema the human is defined by the desire for recognition - a desire that could be satisfied only with the conservation of its object (the person who provides love, honour, respect) - and the will to risk one's life in order to satisfy that desire. The realm of the human and of history is defined specifically in contradistinction to the realm of the animal and of nature.

The desire for recognition is the motor of history, and Kojève used the master-slave dialectic as an allegory of human development: bloody battles for recognition were followed by the rule of the masters over the working slaves. Slaves were those whose animal desires for self-preservation led them to surrender and to recognize the masters. The masters, however, could not satisfy their human desire, because they were recognized by *mere* slaves. Eventually the slaves deposed the masters through revolution but they remained in servitude in relation to their work. This is the bourgeois condition. Real freedom would come only through the universal recognition of each and every one as a citizen.

The final synthesis of the master-slave dialectic is the freedom of universal recognition because it provides full (human) satisfaction. It also represents the end of history, since once the desire for recognition is satisfied there will be no force to create historical (human) change. There would be merely the activity of beings seeking to satisfy animal (nonhuman) desires. In other words, rather than engaging in action to achieve freedom and recognition, after the end of history 'people' would find ways of acquiring toys of various sorts. For Kojève, the end of history was the 'definitive reality' that served as a transhistorical standard of judgment.

3 Later works

In the 1930s, Kojève situated his reading of Hegel just before a revolution that would be a final confirmation of the interpretation itself. History was ending in universal recognition, and Kojève was contributing to the self-consciousness that would be part of the final state. Perhaps in response to some important criticism of his views by Leo Strauss, and certainly in response to the increasingly congealed political situation of the early 1950s, I have argued that Kojève abandoned his 'heroic Hegelianism'. He continued to believe that the culmination of world history would define the truth of all previous events, but in his later work claimed that the end of history had

occurred at the beginning of the nineteenth century. This left the mid-twentieth-century philosopher in the ironic position of having nothing left to say, except to repeat that everything of importance had already been said in order to make sense of what had already been done.

The idea of the 'end of history' in Kojève's later work no longer refers to the triumphant ascension of humanity, but instead, for those who see that we live on the other side of it, signals a final decadence in which humans are distinguished from other animals only by their snobbery. Kojève's early combination of Marx, Hegel and Heidegger in the service of claiming the future of the world is thus incorporated into a perspective reminiscent of Weber on the routinization of life. The closure of the end of history is an iron cage in which human animals can engage in a variety of activities without struggle because their essential drives have been satisfied. Kojève takes an ironic stance towards this condition in which the struggle for recognition is replaced by conspicuous and endless consumption; historical change is replaced by animalistic or snobbish repetition.

Kojève's idea of the end of history spoke to the dissatisfaction of those on the left and right who thought that liberalism and modernity left no possibility either of genuine human life or of greatness. The philosopher continued his work among the bureaucrats until his death, helping to work out trade policies that might be suitable for the end of history.

Kokoro

Kokoro *is a comprehensive term in Japanese religion, philosophy and aesthetics often translated as 'heart', whose range of meanings includes mind, wisdom, aspiration, essence, attention, sincerity and sensibility. In Buddhist texts and in philosophy,* kokoro *(or* shin *in its Sino-Japanese reading) denotes mind, heart or inner nature, the site of human sentience or delusion. By extension, in pre-modern theories of art,* kokoro *signifies simultaneously the emotional capacity of the artist to respond to the natural world, which ideally catalyzes the act of creation; the parallel ability of an audience to respond to such a work of art and thus indirectly to the experience of the artist; and finally the evaluation of such a work as possessing the 'right conception',* kokoro ari *or alternatively* ushin.

While the specific implications of *kokoro* changed in the context of cultural development, its far-ranging meanings, which additionally include intention, vitality, knowledge, sentiment, wholeheartedness, reason, state, appearance, spirit, will and duty, imply both a dynamic potentiality and a fundamental concern with the authenticity of human being as well as its integrity. This integrity precludes any dualistic mind-body distinctions. Ultimately, *kokoro* serves as the foundation for almost all pre-modern Japanese theories of art, which may be described as expressive-affective in their orientation (see Aesthetics, Japanese).

In Buddhist writings we often encounter *kokoro*, especially in its compound form *shin*, as in the well-known Buddhist dictum *ishin denshin* (transmission from mind to mind), alluding to the ideal transmission of spiritual truth that is intuitive in nature and does not rely on verbal and other explicit means. In Buddhism, *kokoro* or *shin* is not simply the faculty for apprehending truth, but can also be the site of delusion and desire within human being, as suggested in the phrase *kokoro no yami* (the darkness of the heart), in other words, the spirit of the unawakened being still wallowing in the mire of the phenomenal world. In seeming contrast to the usage of the terms *ushin* and *mushin* in aesthetics, in Buddhism, *ushin* (having heart or mind) and *mushin* (lacking heart or mind) represent respectively the deluded state of being attached to the world (that is, possessing desires) and the liberating state of awareness that has eschewed the heart and hence all desire.

In the realm of pre-modern artistic theories, *kokoro* receives not only extensive theoretical treatment as a crucial artistic component, but becomes a term of aesthetic approbation as well. In the often quoted Japanese preface to the *Kokinwakashū(The Anthology of Japanese Poetry Ancient and Modern)*, *circa* 905, Ki no Tsurayuki conjoins the concept of *kokoro* with a parallel concept *kotoba* (words), and begins 'Japanese poetry has the human heart (*kokoro*) as its seed and burgeons forth into myriad words (*kotoba*) as its leaves.' He traces the genesis of poetry to the fact that all living beings respond to the natural world around them in the form of song, like the cries of birds in the midst of blossoms or frogs croaking in the water. Hence, *kokoro* is that faculty within us which hearkens to the world outside and poetry is what results when we give utterance to the feelings and thoughts in our hearts in the form of words. However, he also offers a secondary understanding of *kokoro* when he goes on to imply that *kokoro* (heart, conception, treatment) and *kotoba* (words, diction, materials) are the two constituent elements of any poem, which may be used to evaluate the success of any poetic endeavour. He criticizes, for example, a verse by a well-known poet of a former age Ariwara no Narihira with the comment *kokoro amarite, kotoba tarazu* (too much heart and too few words). Ideally, we infer, the poem must have a balance of *kokoro* and *kotoba*.

This interest in *kokoro* and *kotoba* is echoed and developed by the twelfth-century poet-critic Fujiwara Shunzei, who in surveying what he perceived as the second-rate nature of the poetry of his age, issues the challenge, *kotoba furuku, kokoro atarashi* (old words, new heart). He argues for the need to retain the traditional diction and materials, but to infuse them as well with a new spirit that would revitalize them. Apart from regarding *kokoro* as merely the resonant capacity within all living beings to feel and respond as well as one of the constituent components of poetry, Shunzei goes further and elevates *kokoro* into an aesthetic ideal known as *ushin*. His son Fujiwara Teika develops his father's theory still further, describing *ushin*, which may be translated as 'having heart', as signifying an intensity or conviction of feeling which is paramount. *Ushintei* (the style of *ushin*), as he comments, is the overarching style of the so-called ten styles of poetry; all great poetry for him must possess this intensity of feeling, whose articulation is influenced by the Tendai Buddhist contemplative practice of *shikan*, or concentrated meditation.

The Buddhist notion of *ushin* as still being mired in the desires of the phenomenal world, and *mushin* as a release

from such delusion, stands in sharp contrast to the role of *kokoro* in poetry, which is composed in response to the beauties of the natural world, and thus itself is illusory and deluded. Hence, a conflict emerges between poetry and religion in which poetry is seen to represent as well as encourage attachment to the phenomenal world, and doctrinally is both deceived and deceptive. The medieval poet Saigyōillustrates this predicament in his poem in the *Shinkokinwakashū(The New Anthology of Japanese Poetry Ancient and Modern)* (IV, 362), when he mentions that though a priest, he 'lacks a heart' (*kokoro naki*); in other words he has renounced the world. Nevertheless, as a human and as a poet, he remains beguiled by the natural realm and hence is trapped. This dilemma is mediated by a new understanding of poetry itself as a religious path or *michi* in the form of *shikan*, disciplined contemplation, as *kadō* (the way of poetry). Paradoxically, delusion can be an instrument of awakening as in the Buddhist notion of *hōben*, or expediency, as illustrated by the use of parables.

During this period *kokoro ari* (having heart), apart from its Buddhist implications, came to mean also decorous, or worthy of the canonical stamp of approval, in contradistinction to *mushin*. Poetry that adhered to the conventions was labelled *ushin*, and aberrant poetry that deviated too much from the norms was termed *mushin* or substandard. These terms subsequently came to be applied not only to *tanka* (the classical form of poetry) but also to the newer form of linked verse known as *renga*, which was subdivided into two kinds, serious and comic (or careless).

The *Nō* playwright and critic Zeami (*c*.1363-1443), whose theatre was grounded in the beliefs and practices of Zen Buddhism, further expands the significance of *kokoro* when he remarks cryptically in his treatise known as the *Fūshi kaden (Teachings on Style and the Flower)*, 'The flower is the heart (*kokoro*), the seed is the performance', an inversion of Tsurayuki's original assertion some centuries before. Now the heart no longer functions as the seed of poetry, but becomes instead the culmination of *Nō*, aesthetically and spiritually, as emblemized by Zeami in the metaphor of the flower. Ironically, the performance, while seminal, is secondary ultimately to the epiphanic awareness blossoming in the hearts of those expressing their feelings and those affected by it.

Kokoro also proved central to perspectives outside Buddhism, as in the commentaries of the classics written by the *kokugakusha* (scholars of national learning) in the eighteenth century, who sought to elevate indigenous traditions in opposition to imported philosophies such as Confucianism and Buddhism. Motoori Norinaga, for example, rather than merely seeing *kokoro* as either a capacity of the perceiver or the place of moral conflict within an individual, stresses the idea of *kokoro* as the intrinsic or essential nature of objects themselves, in the form of *koto no kokoro* 'the essence of abstract things', such as the sadness of an experience, and *mono no kokoro*, 'the essence of natural things', such as the beauty of blossoms.

Kotarbiński, Tadeusz (1886-1981)

Kotarbiński was one of the founders and main representatives of the Polish philosophical school known as the Lwów-Warsaw School and akin to, though independent of (and less radical than), the Vienna Circle; an anti-metaphysical, pro-scientific, rationalistic school of philosophy, which was very active and influential between the First and the Second World Wars.

Kotarbiński's programme for philosophy was a minimalistic and a practical one: he stressed the need to purify the field of philosophy of questions and concepts that lack factual content or logical coherence. According to him, the term 'philosophy' should be used, if at all, to denote only logic (understood as the philosophy of cognitive thought) and the philosophy of action, including moral philosophy. His numerous (more than 500) works are devoted to logic and philosophy of action in this broad sense. One of his main original ideas is the doctrine of reism or concretism, a special version of nominalism.

Kotarbiński was admired by several generations of his pupils for his unusual pedagogical gifts, his integrity and his moral courage.

1 Ontological reism

Tadeusz Kotarbiński studied philosophy and classics at the University of Lwów. From 1918 he was a professor of philosophy at the University of Warsaw. After the Second World War he was the president of the University of Lódż(and from 1951 to 1956 a chairman at the University of Warsaw. When he retired from the University he was elected president of the Polish Academy of Science and from 1960 to 1963 he was the chairman of the International Institute of Philosophy.

His main subject of inquiry and teaching was logic in a broad sense of the term, comprising formal logic as well as semiotics and methodology of science. He wished to reconstruct the conceptual apparatus of logic in this sense to make it an exact discipline which would fulfil the rigorous criteria of intelligibility and soundness. One of the results of this project was the reduction of all categories to the category of things, known as his doctrine of *reism* or *concretism*.

In its original formulation (Kotarbińsky 1929) the doctrine of reism was the ontological thesis, answering the question 'What is there?' According to this doctrine, all objects are things, that is, only concrete, physical objects (including sentient bodies) exist. There are no so-called abstract objects: properties, relations, states of affairs, and so on. Things can be white or black, but there is no such being as whiteness or blackness; two things can be similar to each other or - if they are sentient bodies - can be friends with each other, but there is no such being as similarity or friendship. The apparent existence of beings of these kinds is an illusion which has its origin in our use of the corresponding abstract terms in the same syntactic role as names of things. To avoid the illusion one has to realize that this usage is a metaphorical one: when translated into the literal mode of speaking, sentences containing abstract terms (apparent names or *onomatoids*) turn out to refer to concrete, physical individuals.

In its old ontological version the doctrine of reism can be (and was) objected to as one which cannot be consistently formulated. For to deny the existence of properties, relations and so on, one has to use apparent names as subjects in sentences (for example, 'Properties do not exist') which - according to reism itself - cannot be literally interpreted. On the other hand, the thesis 'Whatever exists is a thing' is nothing more than a decision concerning the choice of language: namely, the decision to use a language allowing only things as values of variables which can be bound by the existential operator (see Nominalism).

2 Semantic reism

For this reason Kotarbiński reinterpreted his reism as the semantic thesis according to which any sentence having cognitive value is (or can be translated into) a sentence referring only to things; in other words, apparent names of properties, relations and so on can always be eliminated from sentences without any loss of content.

To prove this thesis one should be able to formulate methods of transforming all kinds of sentences which are generally accepted as meaningful - especially all scientific theorems - into sentences which do not contain apparent names. Yet lack of such a method does not falsify the thesis: one can argue that if, for example, in physics there is

no method of translating sentences which contain the term 'field' (which does not seem to be the name of a thing) into sentences containing names of things only, this is because the concept of field is not sufficiently clear; physicists should seek its explication.

However, there is a discipline which does have a clear and exact conceptual apparatus while including abstract terms which seem to be irreducible: mathematics. The most troublesome case is the concept of class (in the distributive, set-theoretical sense). The simplest contexts containing this term can be replaced by contexts which do not contain it (for example, the sentence '*x* is a member of the class of dogs' by the sentence '*x* is a dog'); but there seems to be no method of eliminating the term 'class' from more complex contexts ('*x* is a member of the class of the classes of…' and so on).

Thus, as a semantic thesis, reism is not a theorem but a postulate or a suggestion. The reason for accepting this postulate is that speaking - if possible - only in terms of things is the best way of avoiding Bacon's *idola fori*: illusions and confusion in thinking caused by the traps of language. Kotarbiński had his predecessors (such as, Leibniz and Brentano), but his reism was more radical as concerns the mind-body problem in the light of his thesis that only physical objects exist (pansomatism).

3 Independent ethics

As a young student, Kotarbiński began to look for a replacement for the religious justification of morality, considering the suggestions of Stoicism, Epicureanism and utilitarianism. After many unsatisfactory trials he came to the conclusion that

> ethics…, just as medicine or administration, does not need a justification derived from an outlook on life. Its rules are invariable no matter whether a rational person is a materialist, an idealist or a spiritualist…. What, on the other hand is needed is to avoid using fantasy in justifications.
>
> (Kotarbiński 1952)

In the light of this he formed an ethical system which he called independent ethics

As the main parameters for the moral evaluation of actions he distinguished the following antitheses of what he called motives: kindness - cruelty; honesty - dishonesty; courage - cowardice; competence - indolence; composure - succumbing to temptation. Further, he described the moral ideal as a trustworthy guardian: a person on whom one can count, in a difficult situation, 'not an egoist but a kind person, a reliable, courageous, competent, and composed man'. In striving for this ideal one has to establish a hierarchy of persons and needs, and to complement the evidence of one's consciousness with suitable extra-ethical assumptions.

Kotarbiński's system of ethics is independent in a double sense: first, because it is free of any religious or philosophical assumptions, and second, because according to it, the conscience of a human being is the supreme judge of their actions, and cannot be replaced by that of anyone else.

4 Praxiology

As early as his first work Kotarbiński stressed the necessity of elaborating the conceptual apparatus for practical philosophy in a broad sense; first he called it general practice, then general methodology or praxiology. The programme of general methodology was outlined by Kotarbiński at the IX International Congress of Philosophy held in Paris, in 1937. He defined it as the investigation of 'rules of intentionality in action which are of value regardless of what material is being worked upon and to which a division of labour of arts or skills belongs'.

The programme was carried out in his main exposition of praxiology, *Traktat o dobrej robocie* (1955). The book contains numerous conceptual distinctions, definitions and rules which afford the basis for the utilitarian evaluation of actions according to their effectiveness and efficiency. Kotarbiński considered it to be a closed canon of praxiology.

Some ideas of praxiology can be found in writings of earlier thinkers (A. Bogdanov, G. Hostelet), but Kotarbiński's work in this field was both pioneering and systematic.

Koyré, Alexandre (1892-1964)

The scope of his research and his effort to give civilization meaning make Alexandre Koyré one of the boldest and most influential of twentieth-century historians of scientific thought. He was Russian of origin, German by philosophical training, French by adoption, and chose the USA as his second intellectual homeland. From the mysticism of the Renaissance to Romantic philosophy, from Copernican theory to Newtonian synthesis, he interpreted modern cosmology in the light of 'the unity of human thought' and of mathematical realism, as both effect and origin of a 'spiritual' revolution.

After the Russian Revolution of 1905 Koyré was arrested and is said to have read Husserl's *Logical Investigations* in prison. From 1908 to 1914 he studied in Paris with Bergson, Lalande and Brunschvicg and in Göttingen with Husserl, Hilbert and Reinach. His made his debut with an essay on Zeno's paradoxes, centred on the concept of movement, leitmotif of his later work as a historian of science. Realist phenomenology led him to study scholastic theology with Gilson and Picavet. In 1914 he enrolled as an officer in the Foreign Legion and was posted on the Russian front, taking part in the February Revolution and fighting in the October Revolution.

Having emigrated to Paris in 1919, he taught philosophy in Montpellier and from 1931 was in charge of the *direction d'études* of 'History of Religious Ideas in Modern Europe' at the École Pratique. In 1929, an important doctoral dissertation on Boehme and an essay on Russian Romantic philosophy showed his capacity to unite the 'profound intuitions' of metaphysics with cultural contexts like Renaissance spirituality or Russian nationalism by means of 'conceptual analysis'. He studied the terminology of Russian mysticism, of Spinoza and reinterpreted Hegel phenomenologically, in a way decisively influential for the Hegelianism of Kojève and Sartre. It was largely thanks to the journal *Recherches philosophiques* (1931-7), edited by Koyré, Puech and Spaier, that phenomenology and existentialism were promulgated in French philosophy between the wars. At the conference on phenomenology of the Société Thomiste at Juvisy in 1932, Koyré criticized Husserl's evolution towards the transcendental idealism of the *Cartesian Meditations*, of which he had reviewed the French edition in 1931. He believed in phenomenology, in its ontological meaning, as a method for studying essences, not as a metaphysic, as he observed with regard to Heidegger.

At the same time Koyré began a history of science with studies of Nicolas of Cusa, Paracelsus and Copernicus. For Paracelsus he adopted Lévy-Bruhl's notion of 'mentalité': ' what is most difficult and most necessary when we tackle the study of thought that is no longer ours, is to forget what we know' (1955b: 46). It was not philosophy of history that interested Koyré, but the uncertain adventures of Western philosophy before its issues had become stable: *itinerarium mentis in veritatem* (the mind's journey toward the truth). Scientific doctrines, like theological ones, belonged to 'structures of thought', which is what he called Dilthey's *Weltanschauungen* and Hoffding's 'concepts of the world'. Koyré was moved towards science by the epistemological circle of Meyerson, Lévy-Bruhl and Hélène Metzger: ' Have I remained faithful to Meyerson? Not completely, because in my studies I have striven to show not the identical basis of human thought, but the differences of its structures in different historical periods. I have remained faithful to his precept of studying the reasons for mistakes with the same attention accorded to successes' (1986: 139).

In his masterpiece *Études galiléennes* (1939), dedicated to Meyerson and inspired by Burtt (1925), Koyré studied the difficulties and failures with regard to the concept of movement as a state and to the principle of inertia, 'paradoxes' contrary to experience, conceivable only through ideal experiments on nature made mathematical. Making space geometrical and the universe infinite defined the 'scientific revolution' as a 'revenge of Plato upon Aristotle'.

This polemically antipositivist representation of modern science became known when his essay 'Galileo and Plato' (1943) was published by the History of Ideas Club, while Koyré was in New York to found the prestigious École Libre des Hautes Études with Maritain, directing the review *Renaissance* and lecturing on Plato at Columbia University. After the war, his project for a chair in 'History of Scientific Thought' at the College de France having failed, Koyré became a member of the Institute for Advanced Study in Princeton in 1955. He continued teaching in Paris with the history of religious ideas and of scientific thought at the Department of Economic and Social Sciences at the École Pratique.

Acceleration, heliocentricity, attraction and the Newton-Leibniz controversy are the themes of the ‘scientific revolution’ developed by Koyré. In the course of his research, this category turned out to be unstable and the length of the work problematic. In *From the Closed World to Infinite Universe* (1957), his main work of synthesis, he went as far as Laplace, though he intended to extend it to Maxwell and Einstein.

‘Scientific thought does not develop in a vacuum but always within a frame of ideas, of fundamental principles, of self-evident axioms which have usually been considered as belonging properly to philosophy’ ([1961b] 1971-2: 256). By opening science to the interaction of other collective representations and recreating the language of the past with the coherence of his terminology, Koyré put the history of science on a footing with anthropological history and established a historical methodology as a new way of analysing science. His influence on Kuhn and Foucault renewed epistemological controversy, though in ways often distant from and even opposed to his own work.

PIETRO REDONDI

List of works

Koyré, A. (1922) *Essai sur l’idée de Dieu et les preuves de son existence chez Descartes (The Idea of God and the Proofs of His Being in Descartes)*, Paris: Leroux; repr. New York: Garland, 1987.(The foundations of Cartesian theology through the notions of infinity and perfection as discussed in the *Meditations*. Submitted for the certificate of the École pratique des hautes études, it earned him election of a lecturership at the Section of Religious Sciences at the École. See 1938.)

Koyré, A. (1923) *L’idée de Dieu dans la philosophie de Saint Anselme (The idea of God in Saint Anselm’s Philosophy)*, Paris: Leroux; repr. ivi, Vrin, 1984.(Prepared earlier under the direction of François Picavet, it satisfied the requirements for his degree at the Sorbonne.)

Koyré, A. (1929a) *La philosophie de Jacob Boehme (Jacob Boheme’s Philosophy)*, Paris: Vrin; 2nd edn, ivi, 1971; repr. New York: B. Franklin, 1968.(His doctoral thesis dedicated to Brunschvicg and Gilson, on the mystical cosmology of a contemporary of Galileo and Descartes who was later considered a source of the Hegelian metaphysics. See 1955a.)

Koyré, A. (1929b) *La philosophie et le problème national en Russie au début du XIX^e siècle (The Philosophy and the National Problem in Russia)*, Paris: Champion; 2nd edn, ivi, Gallimard, 1976.(A critical reflection on the cultural identity of his mother country through Russian nineteenth-century followers of Hegel and *Naturphilosophie*. See also his *Études sur l’histoire de la pensée philosophique en Russie*, Paris: Vrin, 1950.)

Koyré, A. (ed.) (1934) *Copernicus, Des révolutions des orbes célestes, livre ler*, Paris, Alcan; repr. Blanchard, 1970.(A translation and commentary of the cosmological part of Copernicus’ work with a historical and interpretative introduction. A seminal contribution to an intellectual history of science proper, this edition also marked Koyré’s transition to the metaphysical commitments of late Renaissance science too. See 1961.)

Koyré, A. (1938) *Trois leçons sur Descartes (Three Lectures on Descartes)*, Le Caire: Éd. de l’Universite du Caire; repr. in *Entretiens sur Descartes*, New York: Brentano, 1944.(Published in French and Arabic while a visiting professor in Egypt, these lectures on the *Discourse on Method* introduced his notion of ’revolution’ through the geometrical and infinite universe of Cartesian physics.)

Koyré, A. (1939) *Études galiléennes*, Paris: Hermann; trans. J. Mepham, *Galileo Studies*, Atlantic Highlands, NJ: Humanities Press, 1978; Hassocks: Harvester Press, 1978.(Three essays on the problem of the law of falling bodies and the principle of inertia in Galileo and Descartes’ physics. Arguing polemically, Koyré introduced Galileo’s experiments and the discovery of inertia as belonging to Descartes.)

Koyré, A. (1943) ’Galileo and Plato’, *Journal of the History of Ideas* 4: 400-28.(Galileo’s mathematical physics as a ’Platonic revenge’ against the traditional positivist view of the history of science. Republished in 1968.)

Koyré, A. (1945) *Discovering Plato*, New York: Brentano.(Presented at Columbia University and also published in a French edition, these lectures applauding democracy through a commentary of Plato’s *Republic* had been composed in Beirut after the fall of France in 1940.)

Koyré, A. (1948) ’Du monde de l’à-peu-près à l’univers de la precision’ (From the World of Approximation to the Universe of Precision), *Critique* 28: 806-23.(An important essay applying his notion of the intellectual revolution of classical physics to the problem of the origins of Western technology. Republished in 1961b.)

Koyré, A. (1955a) *Mystiques, spirituals, alchymistes du du XVI^e siècles allemand (Mystics, Spiritualists, Alchemists of Sixteenth-Century Germany)*, Paris: A. Colin; repr. Gallimard, 1971.(The republication of these earlier essays on Boehme’s most important Renaissance sources - Schwenkfeld, Franck, Paraceisus and Weigel

- was related to the author's collaboration with the journal Annales, especially with Febvre.)
Koyré, A. (1955b) 'A Documentary History of the Problem of Fall from Kepler to Newton', *Transactions of the American Philosophical Society* 45: 329-95.(An exemplary case study of the ramifications of a physical problem through an anthropological approach.)
Koyré, A. (1957) *From the Closed World to the Infinite Universe*, Baltimore, MD: Johns Hopkins University Press.(In this best-known work he traced the relation of God to the world from Nicolas of Cusa's cosmology to Newtonian natural theology.)
Koyré, A. (1961a) *La révolution astronomique*, Paris: Hermann; repr. ivi, 1974; *The Astronomical Revolution*, London, Methuen, 1980.(His last book on Kepler's astronomical metaphysics situated between Copernicus' geometrical cosmos and Borelli's celestial mechanics.)
Koyré, A. (1961b) *Études d'histoire de la pensée philosophique* (Studies in History of Philosophical Thought), Paris: A. Colin; repr. ivi, Gallimard, 1970.(Contains the three most important essays by Koyré on Hegel: 'Note sur la langue et la terminologie hégélienne' (Note on Hegelian Language and Terminology) 1931, 'Rapport sur l'état des études hégéliennes en France' (Report on the State of Hegelian Studies in France) 1931 and 'Hegel à Jena' (Hegel in Jena) 1934. Instead of the prevailing image of the young Hegel diffused in France by Jean Wahl, these essays dealt with the problems inherent to Hegelian language, philosophy of time and *Logik*.)
Koyré, A. (1965) *Newtonian Studies*, Cambridge, MA: Harvard University Press, London: Chapman and Hall.(A collection of essays on the synthesis of terrestrial and celestial mechanics by Newton and the theological differences between Newtonian and Cartesian doctrines of space).
Koyré, A. (1966) *Études d'histoire de la pensée scientifique (Studies in History of Scientific Thougth)*, Paris: PUF; repr. ivi, Gallimard, 1973; English trans. of part of the latter: *Methaphysics and Measurement: Essays on the Scientific Revolution*, Cambridge, MA: Harvard University Press, and London, Chapman and Hall, 1968.(An important collection of his papers concerning the methodology of history of science and critical studies from the Middle Age to Pascal.)
***** (1986) *De la mystique à la science. Cours, conférences et documents, 1922-1962 (From Mystical Theology to Science. Courses, lectures and documents 1922-62)*, Paris: Éditions de l'EHESS.(This collects Koyré's course abstracts, unpublished lectures on theology and science and documents on his teaching and biography.)
Koyré, A. and Cohen I.B. (eds) (1971-2) *Isaac Newton's Philosophiae Naturalis Principia Mathematica*, Cambridge, MA: Harvard University Press, 2 vols.

Krause, Karl Christian Friedrich (1781-1832)

Krause sought an overall explanation of reality in the manner of the post-Kantian idealists; the key elements of his thoughts are the concepts of organism and harmony, involving the incorporation of opposing elements rather than their annihilation. Three main themes characterize his philosophy: the doctrine of science, together with the equivalence of knowledge and being, or rational realism; the religious doctrine of panentheism which proclaims, 'everything in God'; and the social doctrine of the League of Humanity.

1 Life

Krause was born in Eisenberg, in the region of Thuringia. He studied theology, mathematics and philosophy at the University of Jena, with Fichte and Schelling. There he habilitated as a *Privatdozent* in 1802, having written his dissertation, *Dissertatio philosophico-matematica de philosophiae et matheseos notione et earum intima coniunctione (Philosophico-Mathematical Dissertation on Philosophical and Mathematical Ideas and Their Close Relation)*. With increasing success, he taught logic, natural law, the philosophy of nature and his system of philosophy, as well as music. In 1803, the Napoleonic wars forced him to move twice: first to Rudoldstadt, then to Dresden. During this period he wrote *Grundlage des Naturrechts (Basis of Natural Law)* and continued working on *System der Philosophie (System of Philosophy)*. In 1805 he joined the Archimedes Lodge of the Brotherhood of Freemasons, and studied the history of Freemasonry. Five years later he published *Die drei ältesten Kunsturkunden der Freimauererbruderschaft (The Three Oldest Documents of the Brotherhood of Freemasons)*, in which he tried not only to prove that the masonic law of secrecy contradicted two of the Brotherhood's most ancient documents, but also called for its abolition. His expulsion from the Brotherhood of Freemasons was immediately decreed, and he would always attribute his subsequent penury to his Masonic enemies. In 1811 he published *Das Urbild der Menschheit (The Ideal of Humanity)*, in which he set out his doctrine concerning the social structure of humanity. In 1813 the war reached Dresden and he had to move to Tharand; six months later he went to Berlin, where he habilitated again with *Oration de scientia humana (Oration on Human Science)*. He set up the *Berlinische Gesellschaft für Deutsche Gesprache* (Berlin Society of the History and Grammar of the German Language), although he did not succeed in obtaining a post as a teacher. In 1817 he went on a study visit to Italy, France and Germany, and wrote *Aesthetik (Aesthetics)*. In 1825 he moved to Göttingen, where Heinrich Ahrens became his student. It was Ahrens who made his master's philosophy more widely known in Spain. In 1831, student riots forced Krause to move again, this time to Munich, where Schelling opposed his appointment as a professor. Krause died the following year.

2 The System

The first part of Krause's philosophical system is a process of 'analysis' which starts from a subjective perspective, both from knowledge and feeling, and which reveals the essential self (*Ur-Ich*) through intuition (*Anschauung*). This is an expression of individual substantiality, which is still not the thinking self - although this substantiality is one of its main activities - but the real self, unified, alive, different from any other entity. The doctrine of science deals with the cognitive self. However, knowledge does not just involve the logical knowledge of the intellect, but also comprises the areas of feeling and will as parts of the concept of Reason; moreover, the three of them are essential for each other and for their complete development.

Contrary to the Fichtean view, while Krause's 'self' is a foundation of the subjective realm, it is not enough to explain either knowledge of the other or that of the self in relation to the other. Also, the self is considered as a human being, made up of body and soul, finite essences which therefore belong to two universal ones: Nature and Spirit, both of which are contained in the concept of Humanity. And these three beings, infinite in themselves, are limited by each other, that is, in the Krausean language, they are 'relative infinites' and they require a 'Foundation' which comprehends and explains them: a basic and original essence, the absolute Being or metaphysical God (*Ur-Wesen*). From this point Krause moves on to the second part of the System, the Synthesis. He begins by studying the absolute, necessary Foundation and in reverse order reconstructs the whole process of knowledge, objectively and not only in the subjective aspect of analysis.

The 'Real Intuition' of the Absolute is the culmination of the process of analysis witnessed by the self: logical knowledge finds the absolute, necessary Foundation for its own intellectual knowledge. This 'intuition' -

originating from the Latin word '*tuitio*' - has two modes of access to the absolute Foundation through the two aforementioned elements of Reason: the path of feeling, which produces religion's Real Intuition of the Supreme Being, God; and the path of will to the absolute God, which is the foundation of goodness and morality. These three paths integrate the panentheist doctrine, or 'everything in God', which is opposed to pantheism, in which all idealisms come together.

With this discovery, two important problems which idealistic pantheism did not solve are now avoided: human freedom and determinism in history. God is the absolute principle of the world, life and thought: he creates what is finite together with Man. However, this does not constitute a foundational and causal relation in time, but only in a metaphysical sense. The act of creation happened once and for all: Man, who was created like God, has, like him, infinite freedom, which is only limited by the condition that he is a finite being, but not by his essential, vital capacity. Likewise, God is the lord of history from its beginning but he does not intervene either in its temporal evolution or in its end. Contrary to the Hegelian view of history, Krause does not conclude with a fusion of all beings in the Absolute, but in a 'League of Humanity' with God. This alliance is brought about by a free and autonomous decision by both parties.

This explains the importance of the process of analysis and synthesis of the fundamental science from which all individual sciences evolve: psychology, or the analysis of the self's faculties; physics, or the science of nature; and anthropology, or the science of Man. They are all contained in history, which is the expression of Man's action and God's revelation.

The most interesting discovery of Krause's philosophy from the perspective of nineteenth-century idealistic thought is the focus on Man as a living being, that is, Man and environment temporally determined as philosophy's authentic objective. The formal process of science's doctrine of analysis and synthesis, together with the discovery of the self, do not adequately explain the reality of Man considered as a living being, determined in time. There are two essential levels of reality: the permanent and the changeable. Time distinguishes these levels, while Man contains both, inseparably. With this, Krause overcomes the dichotomy between Man and History, ideas and facts. Nature and Spirit are entwined as a supreme synthesis, and this should be their role in the science of life: to establish unions and to propitiate them, since Man is the being of union *par excellence*.

3 Influence

This extremely optimistic thought, which emphasizes the essential goodness of human beings as well as of values such as freedom and equality, made a significant impression in emerging bourgeois societies with new constitutional governments, such as Spain and the Latin American countries. For them, Krausean pedagogy, in conjunction with the ideas of F.W.A. Froebel, was especially attractive and influential as an agent of social change beginning from the full education of the individual, and not from a purely scientific education. Also influential was the philosophy of law, which establishes principles for the union of human beings. It regulates mutual relationships among individuals and social groups, not only in order to achieve their freedom but also for each individual to attain moral perfection. Societies are determined by organic functions (scientific, artistic, moral and religious society) and also by personal ones (individual, family, nation, country).

These disciplines - pedagogy and the philosophy of law - together with the Theory of Science, were extensively elaborated and developed by Krause's immediate followers. They were seen as a part of a continuous process of development which individuals elaborate throughout life when they enter into relationship with all the realities around them, and are indissolubly linked to the concepts of ethics, freedom and autonomy in every social group and in every individual. They both enabled this idealism to connect with the multiplicity of scientific disciplines and research areas which positivism generated in the later nineteenth century. Thus, in an apparent paradox, the German spiritualist current of thought became united with French positivism, combining the main concerns of ethics with the strict determinism of science. In the same way, Krause's emphasis on the concept of harmony between Nature and Spirit confirms him and all his followers as pioneers of ecological thought in its main postulate of harmony and balance between science and the natural world.

List of works

Krause, K.C.F. (1802) *Dissertatio philosophico-matematica de philosophiae et matheseos notione et earum intima coniunctione (Philosophico-mathematical Dissertation on Philosophical and Mathematical Ideas and Their Close Relation),* Jena: Voigtium.(Krause’s Ph.D. thesis, which puts forward the philosophy and mathematics he uses to construct a system which explains reality.)

Krause, K.C.F. (1803) *Grundlage des Naturrechts (Basis of Natural Law),* Jena and Leipzig: Christian Ernst Gabler.(Krause’s first attempt to formulate a world state as a social organization upon which a federation of nations could be established.)

Krause, K.C.F. (1810) *Die drei ältesten Kunsturkunden der Freimauererbruderschaft (The Three Oldest Documents of the Brotherhood of Freemasons)*, Dresden: Arnoldischen Buchhandlung.(Krause’s attack on the Freemasons, in which he called for their abolition.)

Krause, K.C.F. (1811a) *Das Urbild der Menschheit (The Ideal of Humanity)*, Dresden: Arnoldischen Buchhandlung.(Krause’s most translated work, which contains his concept of society determined by organic functions - religious, scientific, the state and art - and by personal functions, such as family, friendship and nationality.)

Krause, K.C.F. (1811b) *Versuch einer wissenschaftlichen Begründung der Sittenlehre (Attempt at a Scientific Foundation of Ethics)*, Leipzig: Reclam.(This work concerns practical philosophy, considered as an essential component in the construction of a philosophical system.)

Krause, K.C.F. (1825) *Abriss des Systemes der Philosophie (Outline of his System of Philosophy)*, Göttingen: Dieterischen Buchhandlung.(Sets out the development of the analysis and synthesis process in Krause’s philosophical system.)

Krause, K.C.F. (1828) *Abriss des Systemes der Rechtes, oder der Naturrechtes (Outline of the System of Right, or of Natural Law)*, Göttingen: Dieterischen Buchhandlung.(The philosophy of law is based on the individual’s freedom and participation in society through associations, one of them being the estate, which is equal to the rest.)

Krause, K.C.F. (1829) *Vorlesungen über die Grundwahrheiten der Wissenschaft (Lectures on the Basic Principles of Science)*, Göttingen: Dieterischen Buchhandlung.(Sets out the Krausean theory of knowledge.)

Krause, K.C.F. (1837) *Abriss der Aesthetik oder Philosophie des Schönen und der schönen Kunst (Outline of Aesthetic and the Philosophy of Beauty and Fine Arts)*, Göttingen: Dieterischen Buchhandlung.(Contains the definition of beauty as the perfect union between Nature and Spirit. This idea is central to Krause’s pedagogic project.)

Krause, K.C.F. (1848) *Vorlesungen über die psychische Anthropologie (Lectures on Psychical Anthropology),* Göttingen: Dieterischen Buchhandlung.(Presents the doctrine of Man and life, based on the Krausean concept of the union of both the material and the spiritual part of being, as well as the need of a harmonious development for being.)

Krause, K.C.F. (1900) *Der Menschheitbund (On the League of Humanity)*, Berlin: Felber.(Apart from developing the theory of a world state, this work offers a federal account of the government of nations.)

Kripke, Saul Aaron (1940-)

Saul Kripke is one of the most important and influential philosophers of the late twentieth century. He is also one of the leading mathematical logicians, having done seminal work in areas including modal logic, intuitionistic logic and set theory. Although much of his work in logic has philosophical significance, it will not be discussed here.

Kripke's main contributions fall in the areas of metaphysics, philosophy of language, epistemology, philosophy of mind and philosophy of logic and mathematics. He is particularly well known for his views on and discussions of the following topics: the concepts of necessity, identity and 'possible worlds'; 'essentialism' - the idea that things have significant essential properties; the question of what determines the referent of an ordinary proper name and the related question of whether such names have meanings; the relations among the concepts of necessity, analyticity, and the a priori; the concept of belief and its problems; the concept of truth and its problems; and scepticism, the idea of following a rule, and Ludwig Wittgenstein's 'private language argument'. This entry will be confined to the topics of identity, proper names, necessity and essentialism.

1 Life

Saul Kripke was born in Bay Shore, New York, the son of a rabbi and a teacher. The family soon moved to Omaha, Nebraska, where Kripke spent the rest of his childhood. At a very early age, he began to display prodigious mathematical ability and intense curiosity about philosophical questions. At the age of 15 he developed a semantics for quantified modal logic and his proof of the completeness of the semantics appeared in *The Journal of Symbolic Logic* when he was 18.

Kripke received his bachelor's degree in mathematics from Harvard in 1962 and was appointed to the Harvard Society of Fellows in 1963. There followed appointments as Lecturer at Princeton (1965 and 1966) and Harvard (1966-8). He was appointed Associate Professor at The Rockefeller University in 1968 (then Professor in 1972), and McCosh Professor of Philosophy at Princeton in 1977, which is the position he currently holds. Kripke was the youngest person ever chosen to give the John Locke Lectures at Oxford (1973) and he has been the recipient of many prestigious honours and accolades.

2 Identity, proper names and possible worlds

Kripke began working on these topics in the early 1960s and developed a number of positions that initially met with surprise and suspicion, but eventually became widely accepted. The most comprehensive presentation may be found in *Naming and Necessity* (1980), which is an edited transcript of three lectures given at Princeton in January 1970, together with a preface and addenda.

Kripke maintains that identity is a relation that holds between each thing and itself, never holds between any two things, and always holds (or fails to hold) of necessity (see Identity). The 'necessity of identity' is a theorem of quantified modal logic (with identity), but some philosophers nevertheless thought certain examples cast doubt upon the doctrine (see Modal logic). For example, the identity of the inventor of bifocals with the first Postmaster General can easily seem contingent. But Kripke observed that what is contingent here is that one person attained both of these (separately contingent) distinctions, and that this contingency in no way undermines the necessity of that person's identity with himself - Benjamin Franklin would have been identical with himself even if he had never been Postmaster General or worked with lenses.

This last point reflects a fundamental Kripkean doctrine about the behaviour of ordinary proper names such as 'Franklin'. It is that when we utter a sentence such as 'Franklin might never have became Postmaster General', we are describing a way in which things might have gone differently for the very person who, in actual fact, was the first Postmaster General. We are describing a 'counterfactual situation' or 'possible world' involving Franklin himself, but in which he is not Postmaster General.

Kripke does not offer a detailed ontological account of possible worlds (though he does explicitly reject the 'counterpart' account favoured by David Lewis (1968)). He does not see worlds as offering a useful analysis of our modal notions, but rather as reflecting pre-existing modal intuitions, and thinks that for most philosophical

purposes we need no precise notion of possible worlds. It is normally sufficient to think in an everyday way of counterfactual situations or alternative possibilities, and this can help relieve any worry that we are trading on a technical notion of possible worlds without first defining it. Now invoking the terminology of worlds, the idea of the previous paragraph generalizes to the claim that an ordinary proper name always designates the same thing 'in other possible worlds' that it designates in the actual world. Kripke introduced the term 'rigid designator' for singular terms that behave in this way, allowing his thesis to be compactly expressed as the claim that proper names are rigid designators. But this rather technical-sounding formulation is intended as little more than a generalization of the hardly controversial idea that 'Franklin invented bifocals' and 'Franklin might not have invented bifocals' both concern the same person.

Now consider the sentence 'Cicero is Tully', which seemingly asserts a true identity and which involves two proper names. If these names are rigid designators, then each designates the same entity in every possible world - the entity that each designates in the actual world. But in the actual world both names designate the same person. It follows that they both designate this person in every possible world, and so it must be a necessary truth that Cicero is Tully. But it has often been thought that because such a fact is not knowable a priori, but rather requires empirical investigation, it could not be necessary. Kripke sees this as a fundamental error, stemming from a confusion of the epistemic notion of a prioricity with the metaphysical notion of necessity. For Kripke, 'Cicero is Tully' expresses an a posteriori, necessary truth (see A posteriori; A priori).

The idea that 'Cicero is Tully' is merely contingent is also fostered by theories of proper names in the tradition of Frege and Russell, according to which the referent of a name is determined by a definite description (or, in more recent versions, a 'cluster' of descriptions) associated with the name. Such theories often hold that the description gives the meaning (or sense) of the name. Because the description associated with 'Cicero' might be utterly different from the one associated with 'Tully', and because these descriptions might have distinct referents in some other world, it would be natural to think that 'Cicero is Tully' is contingent in much the same way that 'The first Postmaster General is the inventor of bifocals' is contingent. But Kripke argued that such theories of proper names are incorrect. His view is more in the spirit of J.S. Mill's and Ruth Barcan Marcus', according to which names are mere 'tags' which lack senses and serve only to pick out their referents. Kripke held that a name is explicitly linked to its referent when it is first introduced, and that subsequent uses of the name refer to that entity because they trace backwards through an appropriate causal chain of uses to that initial introduction of the name. Subsequent uses do not achieve their reference to that entity as a result of its satisfying any specific descriptions associated with the name.

3 Necessity and essentialism

Essentialism is the view that things have certain of their significant properties necessarily - that they could not have existed without possessing those properties (see Essentialism). In the early 1960s the very notion of necessity was often thought to be incoherent. But even philosophers who granted the meaningfulness of the notion and conceded the existence of certain necessary truths typically found essentialism unacceptable.

Much of the antipathy towards necessity and essentialism may be traced to a confusion of necessity with analyticity (see Analyticity). Just as Kripke urged that a prioricity and necessity are distinct notions, so did he insist that analyticity is a third notion, not to be confused with the others. But such a confusion appears to underlie one of the main arguments against essentialism. It was claimed that the idea that a thing has a property necessarily makes no sense absolutely, but only relative to a specific way of designating the thing. For example, if the number nine is designated by 'the number of the planets', then it has the property of numbering the planets necessarily, but if it is designated by 'nine', it does not. So the idea of attributing a necessary property to the object independently of any designation makes no sense (see Quine, W.V.).

This may seem correct if we have not carefully distinguished necessity from analyticity. For 'The number of the planets numbers the planets' seems analytic while 'Nine numbers the planets' does not. But when we set aside analyticity and focus clearly on necessity, the question no longer concerns sentences of our language. Instead we are asking whether a certain object had to have a certain property. If the object is the number nine and the property is numbering the planets, the answer must be 'no', for we can imagine a world in which the solar system developed differently. And if the property is being a square, the answer must be yes. There is no world in which nine is not a square. (Of course it could be that the name 'nine' did not refer to nine. But, in such a world, nine - whatever it

might be called there - would still be a square.)

Kripke argued that ordinary entities also have nontrivial essential properties. Suppose a specific table, T, is made of wood. According to Kripke, although it is possible for tables to be made of other materials, no such possibility exists for T. Of course it is an empirical matter whether T has this property at all. But this merely means the matter is a posteriori, not that it is contingent. We know that such properties as T's location or finish are contingent because we can imagine a world in which T is somewhere else or differently finished. According to Kripke, we cannot imagine a world in which T is not made of wood. When we think we have imagined such a world, closer consideration reveals it is really a world in which some other table has been switched with T (or made instead of T, and so on).

Kripke relies heavily on 'intuition' here and in his other philosophical work. But he is not invoking a special power or sense. Rather, he is insisting that the concepts that concern us in philosophy are, after all, our own concepts, and accordingly that the best evidence for how they fit together can only come from thinking as carefully as we can about them. In this entry we have managed a glimpse at some of the results of this approach in Kripke's work on reference and modality. Comparably powerful and compelling results are to be found throughout the full range of his remarkable work.

Kristeva, Julia (1941-)

Born in Bulgaria, Kristeva entered the Parisian scene of avant-garde intellectuals in the 1960s. Her earliest work in linguistics was shaped by the post-Stalinist communism of eastern Europe, a political climate that exerts its influence on her entire corpus, even as she distanced herself from it, to embrace an increasingly psychoanalytic perspective. Dissatisfied with scientific models of language, conceived as a mere means of communicating preconceived ideas, where words simply function as isolated symbols that represent discrete concepts, Kristeva analyses language as a signifying process. As such, language is not a static and closed system of signs, but a mobile, fluid process that implicates bodily and vocal rhythms in the generation of symbolic meanings. In La Révolution du language poétique (1974) (Revolution in Poetic Language, 1984) Kristeva fuses linguistic insights with psychoanalytic inquiry as she presents two distinct yet interrelated aspects of the signifying process, the semiotic and the symbolic. The semiotic aspect of language is vocal, pre-verbal, rhythmic, kinetic and bodily. The symbolic aspect of language is social, cultural, and rule-governed. Focusing on the interplay between the semiotic and the symbolic, Kristeva is able to analyse literary and historical texts, works of art and cultural phenomena in a way that thematizes the complex relationship between materiality and representation.

1 Life and works

Although Kristeva has come to be known to a large portion of her English readership as a French feminist, the label is misleading. Bulgarian by birth, Kristeva moved to Paris in 1966, and her engagement with feminism has been nothing if not polemical. After an early training in the sciences, she worked as a journalist while pursuing her literary studies. In France, having received a doctoral fellowship, she followed the advice of Tzvetan Todorov, and attended the seminar of Lucien Goldmann. She embarked on a career that is distinguished by its breadth and interdisciplinary approach, the main strands of which - in addition to philosophy - can be identified as linguistics, literature, and psychoanalysis. A research assistant at Claude Lévi-Strauss's Laboratory of Social Anthropology, she also took advantage of the resources offered by the Centre National de Recherche Scientifique, and the École Pratique des Haute Études. As an associate of the *Tel Quel* review, edited by Philippe Sollers, Kristeva quickly took her place at the centre of French intellectual life (see Tel Quel School). She joined the faculty of the University of Paris VII, and became a practising psychoanalyst.

Among the early influences on her work, in addition to Marxism, Mikhail Bakhtin stands out, as does her engagement with structuralism. Semiotics, or the science of signs, provided the focus of her first published works, *Semeiotiké: Recherches pour une sémanalyse* (1969) and *Le Texte du roman* (1970). Adapting and building upon the work of Roland Barthes, Ferdinand de Saussure and Charles S. Peirce, Kristeva began to develop a theoretical framework that would be more fully elaborated in the landmark text *La Révolution du langage poétique* (1974) (*Revolution in Poetic Language*, 1984).

By 1980, with the publication of *Pouvoirs de l'horreur: essai sur l'abjection* (*Powers of Horror: An Essay on Abjection*, 1982) Kristeva's growing interest in psychoanalysis had become decisive. The impact of Jacques Lacan's *Écrits* (1971), and the psychoanalytic training that Kristeva had undergone continued to inform her approach in *Histoires d'amour* (1983) (*Tales of Love*, 1983), *Soleil noir* (1987) (*Black Sun*, 1989), *Étrangers à nous-même* (1988) (*Strangers to Ourselves*, 1991) and *Les Nouvelles Maladies de l'âme* (1993) (*New Maladies of the Soul*, 1995). Her work also includes novels.

2 Linguistics

Language, for Kristeva, has transformative capacities. In order to unearth the heterogeneous character of language, considered as in process, Kristeva departs from the 'generative grammar' of Chomsky that gained popularity in the 1970s (see Chomsky, N.). The Chomskian view that 'surface' structures derive from 'deep' structures appeared to reduce the 'speaking subject' to a series of translinguistic generalities that privilege systematic structures. In its search for truth, its emphasis on logic, and its adoption of scientific procedures Saussurean linguistics fared no better than Chomsky's innatist belief in linguistic universals. Although Kristeva would rehabilitate de Saussure's interest in semiology, she found his implementation of it inadequate to the subject of enunciation, or to what she called the 'speaking subject'. Kristeva's desire to attend to the exigencies of the speaking subject is not a matter of returning to a Cartesian self, or a transcendental ego, but rather takes account of the disruptive and disturbing

qualities that invade the equilibrium of linguistic frameworks that reduce language to a series of rules, or contain it within a formal system of signs.

Kristeva calls for linguistics to change its object of study. It is no longer the theoretical rules governing language, whether these are conceived as grammatical, or semiological, that should be studied, but rather - and it is here that the influence of Roman Jakobson (see Russian literary Formalism) makes itself felt - ‘poetic language’. Far from harnessing or fixing language by establishing its foundational structures, or stabilizing it within a system, Kristeva focuses on a ‘speech practice’ that involves a dialectic between its ‘signified structure (sign, syntax, signification)’, and a ‘semiotic rhythm’. Although Kristeva uses the term ‘dialectic’ to describe the struggle that takes place between ‘language and its rhythm’, she depends on post-Hegelian and post-Marxist resonances to give meaning to the term. It is Heidegger’s vision of the strife of world and earth as the origin of the work of art, and the work of Mallarmé and Artaud, Lautréamont and Bataille, as well as that of the Russian poets Mayakovsky and Khlebnikov, that Kristeva draws on when she observes, in ‘The Ethics of Linguistics’ (in *Desire in Language*, 1977), that the poet ‘wants to make language perceive what it doesn’t want to say’.

Wary of neutralizing the specificity of the speaking subject, Kristeva wants to find a way to recapture the ‘rhythm of the body’, to reclaim the ‘semiotic materials’ that other linguistic models tend to obliterate in their fascination with the technical elements of language.

3 *Revolution in Poetic Language*

By refusing to restrict the significance of language to its meaning - to see in it only a system of representation - Kristeva insists on the materiality of language, on its emergent conditions. In *Revolution in Poetic Language*, she thematizes the divergent modalities of language under the heading ‘the semiotic and the symbolic’. Kristeva’s analysis of the semiotic is informed by Freud’s notion of instinctual drives or impulses, the unconscious, and the pre-Oedipal. The symbolic is associated with the Freudo-Lacanian notion of post-Oedipal relations, with the function of representation, and with language as a sign-system.

The semiotic drives articulate what Kristeva calls the *chora*, a term she inherits from Plato’s account of the creation of the universe in his dialogue the *Timaeus*. The *chora* is a maternal receptacle, a generative matrix, an eternal place that, Plato tells us, is neither visible nor partakes of form, but is in some way intelligible. Amorphous and formless, Plato calls it the nurse of becoming, a kind of wet-nurse. Kristeva retains the paradoxical quality she sees in Plato’s account of the *chora* as formless and undetermined, yet capable of receiving form and determination. The *chora* is neither sign nor signifier, neither model nor copy. It is pre-symbolic, not yet posited, and yet it can be named and spoken of - a process that converts the semiotic into the symbolic, conferring on the semiotic precisely the order, constraint, or law of culture that it resists. Just as Plato’s *chora* resists definition, although it can be spoken of as if it were identifiable as an entity, so Kristeva constitutes the semiotic by naming it, even as its mobile forces elude conceptualization. In both cases the very utterance involves a loss, a betrayal of what language attempts to say. Yet this is a necessary betrayal, since the semiotic relies upon the symbolic for its articulation - one might say for its very existence - even if it suffers a transformation in the process of coming to representation.

If the semiotic needs the symbolic to represent it, the register of the symbolic requires the irruption and influx of the semiotic if it is to remain capable of change. If, in the interests of the very integrity of the semiotic, the subject cannot repudiate the symbolic, neither can it do without the semiotic. The need that the symbolic has for the excesses of poetic motion, or for the otherness of musical rhythm that marks the semiotic rupturing of the symbolic might be described as an ethical and political exigency.

4 Kristeva and feminism

A visit to China which resulted in the book *Des Chinoises* (1974) (*About Chinese Women*, 1977) set the tone for Kristeva’s uneasy relationship with feminism. The book caused controversy, and Kristeva was accused of being ‘romantic’ and ‘utopian’ in her figuring of the Orient as other. Given to dramatic statements, such as ‘a woman cannot "be"’, Kristeva’s often dismissive remarks about other versions of feminism - what she calls in an interview ‘sociological protest’ (Marks and de Courtivron 1981) - did little to curry favour with her detractors. In her defence, it should be pointed out that Kristeva’s work has shared the same fate as that of Luce Irigaray and Hélène

Cixous, with whom she is so often compared. The reception of their work has been plagued by a failure to take account of their intellectual heritage, political contexts and personal biographies. The misshapen versions of their work that critics have handed down to their English-speaking readers made it easy for readers of the 1980s to accuse these three so-called French feminists (Irigaray is Belgian, and Cixous is Algerian) of 'essentialism'. Afraid that Kristeva's caution about totalizing politics, her attempt to reintroduce the body into analyses of language, and the Lacanian influence on her work amounted to a male-identified conservative and reactionary elitism, feminist critics shunned her work. Instead of understanding her insistence upon sexual difference as a refusal to neutralize the specific material conditions of the production of language, conditions which include the sexed body, her attempt to reintroduce the body into feminism was hailed as detrimental to the progress of women's quest for equality.

In the 1990s, Kristeva began to receive a fairer hearing in English-speaking feminist circles, and this was in large part due to the fact that critics began to equip themselves with the conceptual tools that Kristeva's diverse intellectual endeavours required. Not least among these is the importance of phenomenology, psychoanalysis and post-structuralism - specifically Ferdinand de Saussure's structural linguistics and its post-structuralist modifications by figures such as Roland Barthes.

5 Psychoanalysis

When Kristeva denies being to a woman, her assertion takes account of Heidegger's ontological distinction - the difference between a being and Being (or existence) as such (see Heidegger, M.) - and Lacan's notorious statement in *Seminar* XX (1972-3) that 'There is no such thing as *The* woman.' Understood in this light, rather than as a merely polemical statement, it can be read as a way of insisting upon the relevance of sexual difference, the limitations of ontological language, and the need to interrogate the possibilities of situating a woman's subjectivity on a level that does not simply conform to the position of male subjectivity. The position adopted by the female subject is thus one in excess of the boundaries of language, outside the order of being - at least in so far as language and existence are sanctioned as male.

It was Kristeva's abiding interest in language that drew her to psychoanalysis. Interested in the underside of language, Kristeva's work of the late 1980s and 1990s is preoccupied with the exploration of borderlines, marginal existence, outlawed subjectivities, and what it means to be a foreigner, an outsider. While the significance of these themes is by no means limited to sexual difference - the question of nationality, the issue of psychosis, and the desire for abjection are a few of the concerns that Kristeva pursues by focusing upon the limits and borders of subjectivity and consciousness - the question of feminine and masculine identity is a central one.

The symbolic, a Lacanian term that Kristeva invests with a new significance in counterposing it to the semiotic, interprets the father of Freud's Oedipal drama in terms of language. Since the semiotic *chora* has maternal connotations, there is a sense in which the distinction between the semiotic and the symbolic is sexually marked. This does not mean that Kristeva discerns semiotic energies only in the work of women artists. On the contrary - and this has provoked consternation to some feminists - she points more often to the works of Bellini and Giotto, Baudelaire and Proust for their capacity to evoke the sexual pleasure that she calls corporeal '*jouissance*'. This term, like so much of her work, reflects the influence of Lacan, whose impact on Kristeva's corpus is decisive, despite the critical distance she inserts between her own writing and Lacan's *oeuvre*.

TINA CHANTER

List of works

Kristeva, J. (1969) *Semeiotiké: Recherches pour une semanalyse*, Paris: Éditions du Seuil.(Early work on semiotics.)

Kristeva, J. (1970) *Le Texte du roman*, The Hague: Mouton.(Semiotic theory and linguistic literary analysis.)

Kristeva, J. (1974a) *La Révolution du language poétique*, Paris: Éditions du Seuil; trans. M. Waller, *Revolution in Poetic Language*, introduction L.S. Roudiez, New York: Columbia University Press, 1984.(Fusing insights from the diverse sources of linguistics, Bahktin, Hegel, Lacan and others, this central text firmly established Kristeva's reputation as an original theorist, mobilizing the distinction between the semiotic chora as a motile rhythmic sensible aspect of language and the symbolic realm of meaning that has become the hallmark of her work.)

Kristeva, J. (1974b) *Des Chinoises*, Paris: Éditions des Femmes; trans. A. Barrows, *About Chinese Women*,

London: Marion Boyars, 1977.
Kristeva, J. (1977) *Polylogue*, Paris: Éditions du Seuil.(Of the twenty essays comprising this collection, eight are translated in *Desire in Language: A Semiotic Approach to Literature and Art*, ed. L.S. Roudiez, trans. T. Gora, A. Jardine and L.S. Roudiez, 1980.)
Kristeva, J. (1980) *Pouvoirs de l'horreur: essai sur l'abjection*, Paris: Éditions du Seuil; trans. L.S. Roudiez, *Powers of Horror. An Essay on Abjection*, New York: Columbia University Press, 1982.(Psychoanalytic work exploring abjection, perversion and defilement in the context of Céline's novels, the Oedipal myth and biblical semiotics.)
Kristeva, J. (1983) *Histoires d'amour*, Paris: Denoël; trans. L.S. Roudiez, *Tales of Love*, New York: Columbia University Press, 1987.(Freudian inspired theoretical and historical theory of love drawing on religious and literary conceptions of agapē and eros, from Plato to Bataille.)
Kristeva, J. (1987) *Soleil noir: dépression et mélancolie*, Paris: Gallimard; trans. L.S. Roudiez, *Black Sun: Depression and Melancholia*, New York: Columbia University Press, 1989.(Analysis of melancholia and depression as different ways of mourning the lost maternal object.)
Kristeva, J. (1988) *Étrangers à nous-mêmes*, Paris: Fayard; trans. L.S. Roudiez, *Strangers to Ourselves*, New York: Columbia University Press, 1991.(Cultural, political and psychoanalytic analysis of the phenomenon of foreignness, nationality and individuality.)
Kristeva, J. (1993) *Les Nouvelles maladies de l'âme*, Paris: Fayard; trans. R. Guberman, *New Maladies of the Soul*, New York: Columbia University Press, 1995.(A meditation on the function of psychoanalysis in relation to the soul, approached as the 'psyche' by the ancients.)

IX, London: Heinemann, 1975.(Plato's *Timaeus* is a classic ancient text that presents a myth of creation and concerns the themes of space, place and time. Kristeva borrows the term which plays an organizing role in the crucial distinction between the semiotic and the symbolic from Plato's discussion of place: chora, translated as matrix or receptacle, and associated with maternal giving.)

Krochmal, Nachman (1785-1840)

Nachman Krochmal was leader of the Jewish Enlightenment or Haskalah in Galicia, eastern Europe. An astute observer of the German philosophical environment, Krochmal provided one of the first Jewish responses to, and adaptations of, elements of the philosophical work of Spinoza, Kant, Herder, Schelling and Hegel. His posthumously published Moreh Nevukhei ha-Zeman (Guide to the Perplexed of Today) (1851) adapted Kantian epistemological methods to interpret the Jewish religious sources with an eye to discovering their inner, philosophical meaning. Krochmal argued that at that their deeper level these sources, both ancient and medieval, anticipated the discoveries of the German Idealist philosophers. Thus, for example, the Jewish belief in a personal God who created the world and revealed a desired way of life could remain philosophically fruitful. For, when properly interpreted, such ideas were concrete representations of the truths laid bare in the metaphysics of Hegel and Schelling. Krochmal answered the regnant philosophy of history, which considered Jewish culture to have been sublated, by arguing that Jewish religion, by its apprehension of the absolute, stood outside the historical `laws' that mandate the eventual cultural demise of all nations and states.

Although he was an important model for aspiring Jewish intellectuals in eastern Europe, Krochmal's work was of limited philosophical influence. His lasting contribution may be his implicit exposure of the unstated cultural biases of modern idealist philosophy. For his work shows that alternative cultural assumptions would turn idealist philosophy towards philosophical and religious conclusions significantly different from those of the German Idealists themselves.

1 Life and times

Nachman Krochmal was born in the city of Brody in Galicia, eastern Europe, then under Austrian rule and lived in Brody and the Galician cities of Zollkiew, Lemberg (Lwów) and Tarnopol. His birth came in the middle of the decade-long reign of the Austrian Emperor Joseph II, whose ideals committed him to modernizing the educational institutions of the Jews and instilling in them German language skills. Krochmal himself remained largely untouched by the Emperor's educational programme, but the penetration of German language and culture profoundly challenged his Galician-Jewish environment. The movement to bring `enlightenment' to the Jews, known in Hebrew as the Haskalah (see Enlightenment, Jewish), was strongly centred in Galicia and deeply affected Krochmal, who emerged there as its leader. But its programme of cultural modernization was of extremely limited reach and was not accompanied, in his lifetime, by significant political or social change. The small coterie of modernist Jewish intellectuals in Galicia experienced `modernity' mainly in the form of cultural challenges that came, in part, from an ongoing philosophical discussion in a distant land, whose intellectuals they did not know and could not engage with in any immediate way. The medieval Jewish philosophical tradition was of limited help in facing the new challenges, for the medieval Jewish philosophers typically addressed the challenge of Aristotelian thought. In Krochmal's view, Jewish intellectuals needed a new guide, to replace Maimonides' *Guide to the Perplexed* (see Maimonides, M.), if they were to find continued philosophical vitality in the Jewish tradition.

2 *Moreh Nevukhei ha-Zeman*

Roughly one-third of Krochmal's *Moreh Nevukhei ha-Zeman* addresses philosophical themes. He begins his philosophical discussion by noting the incoherence of both philosophical scepticism and religious fideism. Staking out a middle ground between these two extremes required an epistemological foundation that would explain how and why religious thinkers formulate their ideas. Drawing on Kant - as he would have to do to be convincing - Krochmal notes that the path to clear philosophical ideas moves from sensory stimuli to preliminary concepts or representations (*Vorstellungen*), and on to concepts of the understanding (*Begriffe*), and the purely intellectual ideas of reason (*Ideen*). Most people never rise beyond the level of the *Vorstellung*, or representational thought. But any successful religious community must address a broad base. So religious communication is naturally formulated representationally. Diverging from Kant, Krochmal insists that religious representations differ from the more abstract *Ideen* descriptively and linguistically, but are no less apprehensions of truth. Religions always communicate representationally, but they focus on speculative concerns and convey philosophical truths, albeit less clearly than abstract philosophical discourse. Krochmal, then, sees religions as suffused with esoteric

speculation. The task of the interpreter is to uncover the hidden speculative content. Accordingly, traditional Jewish sources and Western philosophical thinking are drawn into a lengthy philosophical dialogue in Krochmal's work.

The Jewish sources traditionally saw a purpose in created existence. Their teleological conception sustained their affirmation of the existence of God. Modern philosophy formidably challenged this view. Spinoza for one dismissed such teleology as illusory (see Spinoza, B. de §4). Kant reaffirmed the logic of teleological judgments, drawing on the interdependent and organic character of nature; but his reaffirmation allowed us to use teleology only as a regulative, not as a constitutive, idea. Hegel developed Kant's argument into a metaphysical claim, affirming the organic nature of existence. Krochmal, too, adapted Kant's argument and, like Hegel, moved the organic characterization of nature beyond the realm of regulative ideas and into metaphysics. He went on to assert that teleology presupposes a willing and thus a personal God as creator. The traditional Jewish sources, then, with their affirmation of divine teleology, communicated, by way of representations, the speculative truth of organic nature and the reality of its purposing creator.

Reliance on a teleological proof that led to a creator God raised a second of the philosophical challenges that faced modern Jews. Hegel, in his `Lectures on the Philosophy of Religion', had identified creation - *creatio ex nihilo* - as the source of the fundamental defect of Jewish religion, its sublimity. In Hegel's view the vision of a world created from nothingness by a transcendent being symbolized the absolute and unbridgeable gulf that the Jewish religion opened up between the infinite and the finite. Christianity, the consummate religion, by rejecting the transcendent otherness of God and relying on the symbolism of the incarnation, overcame that gap, sublated the finite/infinite antinomy, and so reached a more advanced stage of religion and a closer approximation to the truth (see Hegel, G.W.F. §7).

Turning to the work of the medieval Bible commentator and thinker Abraham Ibn Ezra among others, Krochmal argued that Hegel's was not an accurate portrayal of Jewish theology. Creatively drawing on Ibn Ezra and other Jewish Neoplatonists, he reconstructed a vision of a protracted divine drama, in which God begins the process of coming to self-consciousness through a purposeful act of self-limitation. The world is created not from nothingness but from God's very being. Thus it is suffused with divinity or spirit (*Geist*); the gulf between God and the world is illusory. Traditional Jewish images and representations anticipate the fundamental insights of German Idealism. The modern idealist philosophers contribute conceptual vocabulary and conceptual clarity; but it was the ancient Jewish texts that first communicated, however imperfectly, the fundamental insights into the relationship of the finite and infinite.

The awareness that the world and all that it contains, including human intellect, is suffused with *Geist* meant for Krochmal that Judaism was the first, and as yet the only, religion to recognize that nothing exists apart from God. God represents the ultimate unity of all existence, and the God of traditional Judaism corresponds to the absolute spirit of Hegelian philosophy. All other religions and cultures have only partial appreciations of the spirituality represented in the idea of God. Their fragmentary visions of spirit may elevate aesthetics or politics as a bearer of spirit, but only Jewish culture is based on a recognition of the absolute nature of spirit.

This claim of Krochmal's is no mere religious triumphalism. It would, if accepted, contribute to Judaism's continued viability in its confrontation with modern philosophy. But its implications affect the philosophy of history profoundly. Despite the substantial differences between Herder and Hegel (and some would insist that Vico is relevant here as well), each views history as a process in which cultures - represented concretely in the *Volk* or the state - emerge, mature and decay. Whether this process is organic or dialectical, the cultures perish, passing on to the next world-historical culture some central legacy. Modern Europe is the culmination (or at least the latest culmination) of this process. For Hegel, this is because the modern European state stands closer than any of its predecessors to the realization of the absolute in its historical self-consciousness (see History, philosophy of).

Krochmal accepted the idea that history is a process moving towards the realization of the absolute within human consciousness and culture. But his reading of the Jewish sources led him to insist that Judaism has already achieved self-conscious awareness of the absolute. Thus the bearers of the Jewish religion stand clear of the central `law' of the regnant philosophy of history. Unlike other ancient and medieval cultures, the Jews do not wither and perish. To be sure, Jews have an external history like any other people; but their absolute God is not limited by place or historical circumstance. Thus, when Jews are vanquished militarily, their culture and religion retain their

self-evidence; the Jews undergo cultural rebirth and begin a new cycle of growth and maturity. The laws of history proposed by Herder and Hegel apply to other cultures but misrepresent the place of the Jews in history by radically misunderstanding Jewish metaphysics and its historical repercussions.

Krochmal's original contributions to philosophy are limited. Almost all of the central philosophical ideas of *Moreh Nevukhei ha-Zeman* originated elsewhere. And its philosophical sections, written in a difficult Hebrew idiom, were beyond the reach of most of his intended audience. But his implicit exposure of the unstated cultural biases of modern idealist philosophy are an enduring achievement. Readers are quickly brought to the realization that idealist philosophy, as Hegel himself understood, represents its own age, apprehended in thought. A comparison of Krochmal with Schelling or Hegel, among others, brings the Christian, Lutheran roots of idealist thought into sharp relief. Krochmal's reversal of many of the cultural and historical judgments familiar in idealist philosophy, and his elicitation of the central metaphysical claims of idealism from Jewish sources show that a philosopher using different assumptions could develop and apply idealist metaphysical concepts to reach philosophical and religious conclusions significantly different from those of the German Idealists themselves. Krochmal's efforts to reconcile Judaism and idealism provided new insight into Judaism and demonstrated new possibilities within idealism.

Kronecker, Leopold (1823-91)

Leopold Kronecker was one of the most influential German mathematicians of the late nineteenth century. He exercised a strong sociopolitical influence on the development of mathematics as an academic institution. From a philosophical point of view, his main significance lies in his anticipation of a new and rigorous epistemological perspective with regard to the foundations of mathematics: Kronecker became the father of intuitionism or constructivism, which stands in strict opposition to the methods of classical mathematics and their canonization by set theory.

One of the most influential mathematicians in Germany of his time, Leopold Kronecker exercised a strong sociopolitical influence on the development of mathematics as an academic institution. He was a member of the Academy of Science in Berlin and editor of *Crelle's Journal* (the *Journal für die reine und angewandte Mathematik*), and tried to control the future development of pure mathematics as a supreme science by his superb and original contributions to arithmetic, algebra and the theory of functions.

Kronecker became the father of intuitionism or constructivism, anticipating a new and rigorous epistemological perspective with regard to the foundations of mathematics. In his 'Neubegründung der Mathematik' ('New Foundations of Mathematics', 1922), Hilbert compares the views of the two outstanding intuitionists of his own time, Brouwer and Weyl, with those of Kronecker and remarks:

> I believe that as little as Kronecker succeeded in abolishing irrational numbers in his day, just as little will Weyl and Brouwer succeed today. No, Brouwer is not, as Weyl suggests, the revolution, but only the repetition of an attempted Putsch by old means, which in former times, were applied much more resolutely, but wholly without success.
>
> (1922: 160)

Why is Hilbert, the head of the mathematical establishment in the twentieth century, so hostile - and at the same time so respectful - towards Kronecker? One must remember that in 1886 - at a time when Kronecker's influence was still dominant - Hilbert had given a 'solution' to Gordan's problem (to prove the existence of a finite basis for the infinite system of invariant forms) which had perplexed the mathematical world. Instead of constructing a finite basis for the infinite system of invariant forms, Hilbert proved its existence by proving that the assumption of its nonexistence leads to a contradiction.

Such an indirect existence proof was against the basic methodological principles of mathematics that Kronecker had tried to establish. Hence, in Hilbert's opinion, Kronecker's sin was his attempt to restrict mathematical reasoning by setting up arbitrary prohibitions regarding the admissible means of developing and proving certain propositions. This, in turn, leads to an intolerable restriction of mathematical knowledge. But is Hilbert's assessment of Kronecker fair and accurate?

There are very few places in Kronecker's published work where he expresses his philosophical attitude with respect to foundational issues. But in his late essay 'Über den Zahlbegriff' ('On the Concept of Number'), 1887 he is quite explicit. Elaborating a remark by Gauss that just as mathematics is the queen of sciences, so, too, arithmetic is the queen of mathematics, he writes:

> Indeed, arithmetic stands in a relation to the other two mathematical disciplines, geometry and mechanics, that is similar to that in which mathematics as a whole stands to astronomy and the other sciences of nature….Here, however, the word 'arithmetic' should not be taken in its usual restricted sense, but in a broader sense according to which all mathematical disciplines, with the exception of geometry and mechanics, have to be included - in particular algebra and analysis. And I also believe that we will succeed some day in 'arithmetizing' the entire content of all these mathematical disciplines, so that they will be based purely and simply on the conception of number taken in its narrowest sense. Hence, all modifications and extensions of this concept [Footnote: 'I mean, in particular, the inclusion of the irrational as well as the continuous quantities.'], which in most cases were prompted by its application to geometry and mechanics, will once again be stripped off.
>
> (1887: 252-3)

What Kronecker envisages here is in essence nothing other than basing the whole of mathematics, including analysis, on the concept of positive integers without any further existential assumption; in particular without assuming the existence of irrational numbers and continuous quantities. Consequently, he tries to eliminate all numbers 'alien to proper arithmetic' by giving definitions in terms of positive integers and functions thereof. For example, negative numbers can be eliminated by replacing the factor -1 with the indeterminate *x* and replacing the equality sign with the Gaussian symbol for congruence modulo $(x+1)$. The equation $7-9=3-5$ then becomes transformed into the congruence $7+9x=3+5x(\mathrm{mod.}\ x+1)$. Although no one took this particular proposal any more seriously than other proposals to eliminate the rational and irrational numbers, not only Weyl and Brouwer but also Hilbert shared the basic epistemological convictions behind Kronecker's proposals (at least after 1920, when Hilbert developed his finitism). These convictions can be summarized in two statements.

First, the infinite exists nowhere in actuality; neither in nature nor in our thinking. It is a mere potentiality. Therefore it has to be eliminated as an actual object from mathematics and be treated as a mere instrument (Kronecker) or an idea (Hilbert) to facilitate mathematical reasoning. Second, objects or functions, such as irrational numbers or continuous quantities, which presuppose infinite sequences of objects or operations have to be replaced by their proper meaning in arithmetic (Kronecker) or be treated as 'ideal elements' (Hilbert).

Kropotkin, Pëtr Alekseevich (1842-1921)

A founder of anarchist communism and guiding spirit of the international anarchist movement after the death of Bakunin, Kropotkin was also a distinguished geographer, a scientist and a positivist. He saw the development of anarchism as one aspect of the whole movement of modern science towards an integrated philosophy. He believed that the dominant phenomenon in nature was harmony, arrived at by a continuous process of adjustment between contending forces. In human, as in animal societies, the dominant phenomenon was mutual aid: thus once metaphysics, law and state authority had been shaken off, harmony could be realized.

Born into an aristocratic Moscow family close to the Russian Imperial throne, Pëtr Kropotkin was educated at an exclusive military academy, but at 20, filled with the desire to be useful, he renounced a brilliant career to serve for five years as a military administrator in Eastern Siberia.

His hopes for liberal reform by Alexander II, the tsar who had abolished serfdom, were soon disappointed. He also lost any faith in the virtues of state discipline in society and began to move slowly towards an anarchist position (see Anarchism). He now turned to scientific exploration, leading geographical expeditions and achieving distinction as a geographer. His observations laid the foundations of his theory of mutual aid among animal species.

Abandoning military service in 1867, he joined the Russian revolutionary movement in the early 1870s, and after a sensational escape from prison to the West in 1876 became a leading figure in the International, participating in the congress debates between the Marxist and anarchist wings of the movement, which led to the theory of anarchist communism.

After the death of Bakunin in 1876 he became, through his writings and propagandist journalism in *Le Révolté* and *La Révolte*, the guiding spirit of the movement. At the same time, during his years in the West, in England, France and Switzerland, he came to enjoy high esteem as a geographer, publishing in learned journals. He returned to Russia in 1917.

Kropotkin’s anarchist communism aimed at a society without government, where harmony would be obtained

> not by submission to law, or by obedience to any authority, but by free agreements between the various groups, territorial and professional, instituted for the sake of production and consumption as also for the satisfaction of the infinite variety of needs and aspirations of a civilized society.
>
> (1927: 284)

In such a society, as in organic life, Kropotkin believed harmony would result from ’an ever-changing adjustment and readjustment of equilibrium between a multitude of forces and influences’.

The individual would not be limited in the free expression of his powers in production by a capitalist monopoly, or by obedience, which only led to the sapping of initiative. On the contrary, he would be able to obtain the complete development of all his faculties: the fullest individuation.

Like socialists, anarchist communists combated the monopolization of land and capital. But they also combated the state, which, Kropotkin argued, as the instrument for establishing monopolies in favour of ruling minorities, was the main support of the capitalist system. Anarchist communists finally believed, said Kropotkin, that the era of revolutions was not closed. Periods of revolution must be taken advantage of to reduce the powers of the state.

Kropotkin’s anarchist communism was also inspired by his scientific studies: indeed he saw the development of anarchist social theories and the growth of nineteenth-century philosophies deriving from scientific study as simply two branches of the same movement. Anarchism itself was for him a world concept based on a mechanical explanation of all phenomena and embracing the whole of nature, including human societies. Its aim was actually ‘to construct a synthetic philosophy comprehending in one generalization all the phenomena of nature’ (1927: 150). Kropotkin shared the optimism of the positivists of his time with regard to the limitless possibilities of the inductive-deductive method of scientific inquiry. He went perhaps further than Proudhon, or even Elisée Reclus, in rejecting as unscientific all metaphysics and the justification it offered for the power of Church and state, whether

that power emanated from the Christian belief in an all-powerful God or from the Hegelian concept of the Universal Spirit. He went so far, in 1913, as to attack Bergson savagely for denigrating science by arguing that intuition played an important part in scientific discovery.

Kropotkin's own scientific work had convinced him that, in human as in animal societies, the instinct of mutual aid aimed at the preservation of the species was stronger than the instinct for the self-preservation of the individual, the notion of a struggle for life between competing individuals being based on an incorrect interpretation of the work of Darwin. Instead, the fundamental struggle for each species was that of the species as a whole against external forces.

Within human societies therefore, once the monopolization of capital and rule by minorities through their instrument, the state, had been shaken off, harmony could be achieved by a continuous series of adjustments among contending forces.

The central concept in Kropotkin's thinking is that of harmony in nature, a harmony which he himself had observed both in animal species and throughout human history, and which he believed would become possible in the new anarchist communist society. Such harmony is not the result of anything preconceived, but a

> temporary adjustment established among all forces acting upon a given spot - a provisional adaptation. And that adjustment will only last on the condition that it is continually modified; that it represents at every moment the resultant of all conflicting actions. If one force is hampered in its actions, harmony will disappear, force will accumulate its effect and a new equilibrium will emerge.

(1927: 121)

Kropotkin drew an analogy here between the intermittent disruption of harmony in nature by earthquakes and that brought about in societies by revolutions.

He finally believed that the fundamental phenomenon of mutual aid in human societies provided a foundation for a new scientific morality independent of religion. In his *Ėtika (Ethics)* (1922), which remained unfinished, he surveyed the historical development of ethics, pointing to the fact that Darwin, after Bacon, had provided the basis for a new morality. However, that new morality had not yet been worked out. Kropotkin did not live long enough to develop a non-religious morality himself.

Kuhn, Thomas Samuel (1922-96)

The early 1960s saw substantial turmoil in the philosophy of science, then dominated by logical empiricism. Most important was the confrontation of the prevailing philosophical tradition with the history of science. Whereas the philosophy of science was mainly normatively oriented, that is it tried to delineate what good science should look like, historical studies seemed to indicate that the practice of science both past and present did not follow those prescriptions.

Thomas S. Kuhn was educated as a theoretical physicist but soon turned to the history and philosophy of science. In 1962, he published The Structure of Scientific Revolutions (SSR). This book was the single most important publication advancing the confrontation between the history and the philosophy of science; it is now a classic in science studies. SSR was most influential not only in the discussion within philosophy but also in various other fields, especially the social sciences. The central concepts of SSR, like scientific revolution, paradigm shift and incommensurability, have been in the focus of philosophical discussion for many years, and the term 'paradigm' has even become a household word (although mostly not in Kuhn's intended sense). After SSR, Kuhn continued to develop his theory; apart from minor modifications it is mainly the explication of SSR's more intricate philosophical topics, especially of incommensurability, which is characteristic of his later work.

1 Life and works

Kuhn received his Ph.D. in theoretical physics from Harvard University in 1949. While working on his dissertation he became interested in the history of science. His first book-length publication in this field was *The Copernican Revolution* (1957). From the late 1950s, Kuhn started to publish in the philosophy of science, leading to the appearance of *The Structure of Scientific Revolutions* (*SSR*) (1962). This work is now a classic; it has been controversially discussed in extremely diverse fields, and translated into some twenty languages. Kuhn's historical work after *SSR* concerned mainly the genesis of quantum mechanics. *Sources for the History of Quantum Physics* (1967) contains an inventory of relevant material including interviews with many of the contributors to quantum mechanics; *Black Body Theory and the Quantum Discontinuity, 1894-1912* (1978) is a controversial account of the introduction of the quantum hypothesis. Some of Kuhn's papers both on the history and the philosophy of science are contained in *The Essential Tension* (1977).

Kuhn taught at Harvard University until 1956 when he joined the University of California at Berkeley to teach history of science. In 1964, he left for Princeton University. Finally, he became professor for philosophy and history of science at MIT, from where he retired in 1992. He died in 1996.

2 *The Structure of Scientific Revolutions*: survey

Kuhn's *SSR* was probably the most important single work in bringing out the turmoil in philosophy of science in the early 1960s. The table of contents of *SSR* displays a developmental scheme for scientific fields in the basic sciences. This sort of structuring makes its philosophical reading difficult since, for a particular topic, passages scattered around the whole book must be considered.

The first chapter opens with a much-quoted sentence that describes concisely what *SSR* is all about: ' History, if viewed as a repository for more than anecdote or chronology, could produce a decisive transformation in the image of science by which we are now possessed' ([1962] 1970: 1).

Kuhn refers here to two modes of doing history of science. For the older historiographic tradition, the predominant goal was to reach a deeper understanding of *contemporary science* by displaying its historical evolution. This was to be done by discovering the elements of today's science, for example, its concepts, theories, experimental methods and so on, in older texts and by arranging them in a chronological narrative. The resulting picture of scientific development was necessarily a *cumulative* one: science grows step by step by adding new pieces of knowledge to those already in place. But this form of historiography invariably introduces distortions into the presentation of the older science by projecting today's science into the past. Instead, following especially Alexandre Koyré's model, the 'new historiography of science' attempts a display of the historical integrity of a science in its own time. More specifically, the concepts, the research problems and the standards of evaluation of an older science must be reconstructed in a historically adequate way. The aim of *SSR* is to delineate a new image

of science ‘ by making explicit some of the new historiography’s implications’ ([1962] 1970: 3).

The picture of science that emerges from this historiography contains a developmental scheme for scientific disciplines. Before reaching maturity, nascent scientific fields are typically characterized by controversies between competing schools; there is no consensus among the practitioners of the emerging field. This competition may eventually end when one group produces an exemplary solution to a pre-eminent research problem with two characteristics: it is sufficiently unprecedented to attract the members of the other schools, and it is sufficiently open-ended to leave enough interesting problems for further scientific work. These model solutions are called paradigms; they serve to guide research in an implicit way in the following period. This period is called ‘normal science’. It is characterized by a broad consensus of the practitioners of the field about fundamental questions, and, consequently, by a particular mode of research. This mode of research can be described by a five-dimensional analogy to puzzle-solving where exemplars of puzzles include chess problems and crossword puzzles. The analogy concerns:

- the existence of regulations constraining acceptable approaches to and solutions of problems;
- the expectation of the solubility of appropriately chosen problems;
- no fundamental changes in the guiding regulations;
- absence of test or confirmation of the guiding regulations;
- individual motivations: to prove oneself an expert puzzle solver.

Normal science is always confronted with anomalies, that is, with phenomena or problems that behave contrary to the expectations supplied by the paradigm. Usually, anomalies do not call into question the validity of the guiding regulations of normal research. But under special circumstances they may, and then they become ‘significant anomalies’. Then, the practice of science changes again into ‘extraordinary science’ or ‘science in crisis’. Extraordinary science aims at amending or even overthrowing the binding regulations. Its research focuses on the significant anomalies and their context. If this research leads to a new theory that is accepted by the scientific community because it can lead to a new phase of normal science, a scientific revolution has occurred. In Kuhn’s sense scientific revolutions are ‘ the tradition-shattering complements to the tradition-bound activity of normal science’ ([1962] 1970: 6). More specifically, in a scientific revolution an accepted theory is rejected in favour of a new one. This rejection is accompanied by a change of the problem-field and its related standards of solution, and by a sometimes subtle change in basic scientific concepts. Revolutions can even be described as transformations of the world in which scientific work is done. Kuhn compresses these features of revolutions into the concept of ‘incommensurability’: this relation holds between successive traditions of normal science. In *SSR*, the concept of incommensurability was not entirely clear; it was therefore subject to much criticism and also misunderstanding, and most of Kuhn’s philosophical work after *SSR* aims at a clarification and further explication of the concept of incommensurability (see §4) (see Incommensurability).

Because of incommensurability, we must, according to Kuhn, rethink the concept of scientific progress. First, progress is not cumulative, because there are conceptual changes during revolutions. Furthermore, Kuhn denies that scientific progress is an approach to truth. Instead of conceiving of scientific progress as a teleological process, that is, one that is goal-directed, we should think of progress as Darwinian evolutionary theory does. Accordingly, there is no ‘ set goal, a permanent fixed scientific truth’, but ‘an increase in articulation and specialization’ ([1962] 1970: 172, 173).

3 *The Structure of Scientific Revolutions*: philosophical significance

Why is Kuhn’s theory of scientific development philosophically significant? Why did philosophers take notice of a theory that appears essentially historical? The reason is that Kuhn’s theory ran counter to many philosophical convictions about science in the early 1960s. I have already mentioned Kuhn’s altered view of scientific progress (§2). This view implies the untenability of those forms of realism that assert that science at least approximately describes what is really ‘out there’, independently of any observer (see Scientific realism and antirealism §1). Instead, theories describe the world in terms of concepts which are historically contingent and which may change in the future. Furthermore, because of this change of basic scientific concepts, the classical conception of reductionism is hardly tenable. According to this conception, theories may be reduced to more fundamental theories by redefining their concepts by means of the concepts of the reducing theory, and then deriving their laws

from the laws of the reducing theory, supplemented by the redefinitions and, possibly, boundary conditions (see Reduction, problems of §2). But if incommensurability prevails between the pair of theories in question, the reduction relation cannot hold, since some of the required redefinitions are blocked by meaning shifts. In fact, as has become clearer in Kuhn's work after *SSR*, mutual untranslatability of some of the key terms is the hallmark of incommensurability between theories.

Many of *SSR*'s assertions stood in marked opposition to the Popperian philosophy of critical rationalism (see Popper, K.R.). For instance, the practice of normal science as described by Kuhn may look like bad science, because it is not directed at a critical test of the guiding assumptions, but at a quasi-dogmatic exploitation of their potential. Yet, in Kuhn's view, the task of critical evaluation of fundamental theories is restricted to the period of extraordinary science, and even then scientific practice is not simply an attempt to falsify theories by confrontation with basic statements about nature, as Popper would have it. Rather, theory evaluation is always a comparative procedure in which two (or more) theories are assessed with respect to their cognitive abilities, especially, whether they can cope with the significant anomalies from which the crisis state originated (see §2). From this view, theory falsification as described by Popper is a stereotype not found in the actual history of science.

Another consequence of Kuhn's theory is to abolish the idea that science is guided by a scientific method, a set of rules rigorously to be followed (see Scientific method §2). Due mainly to Bacon and Descartes' initial influence, this idea has dominated the understanding of modern science from its very beginning. But according to Kuhn, what chiefly guides scientific research in its normal phase are exemplary problem solutions. Their cognitive potential for research is exploited not by explicit (or fully explicable) rules but rather by implicit analogies; new problems are identified in the light of achieved ones, and new solutions are judged as legitimate in a like manner.

4 Further developments

It is not only that Kuhn opposed many doctrines of established philosophy of science; an additional factor for the sometimes vehement reactions to *SSR* was a deep and widespread misreading of its main theses. Kuhn has thus constantly been challenged to articulate his main theses more fully and to refine them, in the course of which his position has also shifted in some respects.

During the early reception of *SSR*, the main target of criticism was the paradigm concept, which was seen as equivocal. Kuhn responded by distinguishing a narrow sense of paradigm, meaning exemplary problem solutions, from a wide sense which comprises all the components of scientific consensus, the 'disciplinary matrix'. The latter includes, among other elements, scientific values (like accuracy, consistency, fruitfulness, scope and simplicity) which operate constantly but which are especially visible during theory choice. Since these values only guide and do not dictate theory choice, individual scientists can disagree in matters of theory evaluation without any of them being irrational. The latter would be a consequence if theory choice were determined by some fixed set of rules which defined the canon of scientific rationality.

The most important change in Kuhn's position has been a shift from the predominant description of scientific revolutions in *SSR* in terms of visual metaphors to a description by means of a linguistic framework. In *SSR*, revolutions were depicted as something like visual gestalt switches, and their outcome as a changed way of seeing the world. Though meaning shifts played some role in *SSR*, meaning becomes increasingly the dominant theme of Kuhn's later work. But what is the meaning of a term? How is a term connected with its referents? Kuhn does not deal with these profound questions in complete generality but only with kind terms, for example, mass nouns like 'gold' or count nouns like 'cat'. In the sciences, the meanings of kind terms are usually not specified by explicit definitions; rather, they are established by processes involving ostension of typical examples of the kind in question. When objects of the same kind are ostended, they are declared similar, and those not belonging to the same kind are declared dissimilar. By this procedure, a taxonomy of objects can be built up and transmitted. Kind terms involved in the taxonomy can stand in two relations only, namely, either exclusion or inclusion. Partial overlap between contrasting kind terms is forbidden: something is either a planet or a star but not both. Kuhn refers to the net of relations in such a taxonomy as the 'structure of the [respective] lexicon'. It is now characteristic for scientific revolutions, and hence for incommensurability, that the structure of the lexicon changes, resulting in partial untranslatability between propositions articulated by means of different lexicons. Changes of this kind may be initiated by the discovery of objects violating the no-overlap principle, that is, objects that seem to belong to mutually disjoint kinds. Objects of this sort cannot be described with the given lexicon nor

can the lexicon simply be extended or refined in order to make description possible; rather a partial reordering of the categories involved is inescapable.

Kūkai (774-835)

Kūkai, also known by his posthumous honorific title Kōbō Daishi, was the founder of Japanese Shingon ('truth word' or 'mantra') Buddhism and is often considered the first comprehensive philosophical thinker in Japanese history. Building on the Buddhist esoteric tradition first developed in India and then in China, where Kūkai encountered it, he maintained that reality is a cosmic person, the Buddha Dainichi. Dainichi's cosmic thoughts, words and deeds form microcosmic configurations, resonances and patterns of change. By performing Shingon rituals, one can supposedly accord with the microcosmic constituents and know the foundational structures of reality that compose the sensory world in which we ordinarily live.

Kūkai was an aristocrat born on the island of Shikoku, far from the major cultural centres. Trained in the Chinese Classics, he went to the capital area of Nara-Nagaoka at the age of eighteen to study for qualification in the court bureaucracy. Within a few years, however, he left the college and isolated himself in the mountains, practising austerities. In 804 he left for China to study the texts and practices of esoteric Buddhism, which had been only unsystematically and partially introduced to Japan. In China Kūkai studied under Huiguo, the seventh patriarch of Zhenyan (Shingon) Buddhism. He returned to Japan in 806 as the eighth patriarch of the tradition and the first in Japan.

Kūkai devoted his efforts in Japan to establishing Shingon as a major school or sect. He founded a monastic community and temple complex on Mt. Kōya and a major temple, Tōji, in the new capital of Kyoto. He wrote poems, copied sacred texts, painted *mandalas* and undertook civil works such as establishing a public school for boys and girls of all classes, engineering irrigation projects and performing rituals for the relief of plagues and famines. Popular culture reveres Kūkai as a great thaumaturgist of ancient Japan.

Kūkai's philosophical contributions were no less impressive. A prolific writer, he wrote many treatises to explain and justify the basic Shingon position. His philosophical works generally concentrated on two themes, his critique of other philosophical schools and his elaboration of the relation between the nature of reality and the participation in that reality through Shingon ritualistic practice.

On the first point, he developed his theory of the 'ten mindsets' as explained in his *Jūjūshinron (Treatise on the Ten Mindsets)* and *Hizō hōyaku (Precious Key to the Secret Treasury)*. In those works he analysed the limitations of the philosophies known in Japan at the time, including Confucianism and Daoism as well as exoteric forms of Buddhism. Although it was then common in Chinese Buddhism to classify the teachings of the various schools, Kūkai's innovation was to study the teachings as an expression of specific mindsets; he was as interested in the experiential basis of the ideas as in what they said about reality and to whom they said it. This allowed him simultaneously to see their appropriateness and to criticize their incompleteness.

Kūkai's typical critique of the mindsets outside Shingon Buddhism was that they could not adequately justify the basis for their worldviews. For example, the lowest mindset understands its own human existence to be controlled by animal desires. Yet no animal desire could itself lead one to that conclusion; therefore, the mindset is based in something it cannot explain within its own terms. Towards the other end of Kūkai's scale, the ninth mindset, that associated with Kegon (Huayan) Buddhism, understands reality as a web of interdependence in which each thing reflects every other thing. Kūkai basically agreed with that metaphysical model, but questioned whether Kegon could adequately explain how that fact is known. Indeed, what would 'knowledge' even mean in such a context? Kūkai insisted that only the tenth mindset, that of Shingon's esoteric Buddhism, could adequately assert a metaphysical theory and ground that theory within its own parameters. This claim points to Kūkai's theory about knowledge as the self-aware participation in reality.

According to Shingon the cosmos as a whole is a person, the Buddha Dainichi. Like any other person, Dainichi's behaviour can be analysed in terms of thought, word and deed, the respective functions of mind, speech and body. On the cosmic level these functions give reality its configuration, resonance and patterns of change. Specifically, Dainichi's geometric contemplative visualisations (*mandala*) shape reality, Dainichi's intoning of sacred syllables (*mantra*) fill the universe with resonant states of matter-energy, and Dainichi's ritualistic gestures (*mudra*) give the universe its patterns of movement. Therefore, according to Kūkai's analysis, each thing in the universe is

ultimately an expression of Dainichi's enlightened activity.

Of course to our human senses, the universe does not ordinarily appear that way. Because the senses cannot experience the cosmos as a whole, how could Kūkai ground his metaphysical position? His argument was that, like every other thing in the universe, human beings are the product of Dainichi's self-expression. Unlike most other expressions of Dainichi, however, human beings are also persons, beings who express themselves through the activities of thought, word and deed. Hence, the basic functioning of the cosmos is recursively manifest or reflected in each human being. If we delude ourselves into thinking that our actions are strictly our own, separate from all the rest of reality, we cannot justify our metaphysics. What knows metaphysics must itself be metaphysically explainable.

On the other hand, Kūkai argued, if our everyday actions mirror the basic functions of the universe, we can recognize that our own actions are also expressions of Dainichi's activity. The knower and the known are part of the same metaphysical system. Yet how can one become fully aware of this mirroring? The answer is, by enacting the same three activities as Dainichi: contemplating the *mandalas*, intoning the *mantras* and gesturing the *mudras*. Through ritualization, one's own self-expression becomes consciously the same as the cosmos' self-expression. To know reality is to self-consciously participate in it as its own self-expression. Religious praxis and religious knowledge become, in the end, identical. According to Kūkai, that insight was the unique contribution of esoteric Buddhism.

Kuki Shūzō (1888-1941)

Kuki's philosophical project was focused on the issues arising from dualistic thinking. He incorporated into his work a cross-cultural, historical perspective, while applying Heidegger's hermeneutical ontology and exhibiting bold, systematic, speculative acumen.

Kuki Shūzō was born in Tokyo as the fourth son of Baron Kuki Ryūichi. He graduated in 1921 from Tokyo Imperial University, where he majored in Western philosophy and found Raphael von Köbel and Okakura Tenshin particularly inspirational. His graduation thesis dealt with mind-body correlativity. In 1922 he went to Europe to study under Rickert, Oskar Becker, Husserl and Heidegger in Germany, and had an association with Bergson in France. (It was Kuki who introduced Sartre to the philosophies of Husserl and Heidegger.) While in Europe, Kuki acquired extensive and detailed knowledge of Western philosophy. He returned to Japan in 1929, and in 1935 became a professor at Kyoto Imperial University, where he lectured on the history of Western philosophy (see Kyoto School).

Of his complete works - almost all of which attempt to go beyond modern European philosophy - the three best known in Japan are *Iki no Kōzō (The Structure of Iki)* (1930), *Gūzensei no mondai (The Problem of Contingency)* (1935), and *Ningen to jitsuzon (The Human and Human Existence)* (1939). In Heidegger's *Unterwegs zur Sprache (On the Way to Language)*, Kuki's *iki* is thematized in the dialogue between *iki* and a Japanese interlocutor.

Kuki's concern for dualism is expressed in *Iki no kōzō*, wherein he thematized an aesthetic mode of living [*iki+ru*] uniquely found in the intersexual dealings between man and woman that were cultivated in the 'pleasure quarter' as an expression of 'being-of-the-people', in contrast to Heidegger's *Dasein*. He analyzed this mode of living as a phenomenon of consciousness embracing three constitutive momenta: coquetry, liveliness and resignation. It is through the spiritualization of coquetry via the idealism of *bushidō* (see Bushi philosophy) and the appropriation of destiny via Buddhism (in other words, resignation) that *iki* is lived aesthetically as 'liveliness'. Kuki's general thesis is that aesthetics must be sought in the phenomenon of consciousness as it is historically nurtured and articulated in language *vis-à-vis* the 'being-of-the-people'.

In *Gūzensei no mondai*, his *magnum opus*, Kuki brought his concern for dualism to a metaphysical height. He scrutinized in 'metaphysical solitude' the problem of contingency, focusing on: (1) propositional (that is, logical) contingency, which arises from the encounter between particulars ('eidetic singularity'); (2) hypothetical contingency (which encompasses the empirical causal and the teleological); and (3) metaphysical contingency, arising from the playful discrepancies within the one-many relationship. Contingency, or lack of necessity, arises where there is a duality between the necessary one (being or Being) and the contingent other *qua* the many (non-being). Only when there is a concrete interiorization of the other within the one can the logic of life be understood. Herein can be discerned Kuki's effort to resurrect life in the otherwise empty, abstract universals devoid of the humanly constitutive elements.

Kumazawa Banzan (1610-91)

Trained under Nakae Tōju, the founder of the Wang Yangming school (Yōmeigaku) of Confucian idealism during the Tokugawa era in Japan, Kumazawa Banzan is known for his eclectic and pragmatic philosophy emphasizing political and economic reforms. For example, he recommended that the shogunate take greater responsibility for promoting economic equity and prosperity by supporting rice production and storage as well as the use of rice as the medium of exchange. He advocated a form of government dedicated to the Confucian ideal of benevolence.

Kumazawa Banzan is generally regarded as the second leading figure in the Japanese Wang Yangming school of Confucian idealism, following his teacher Nakae Tōju (1608-48), founder of the movement during the Tokugawa era (see Confucian philosophy, Japanese). Whereas Nakae stressed Wang's ideal of the unity of knowledge and action from the standpoint of personal discipline and cultivation, thereby setting an example that greatly inspired his student, Kumazawa, a leaderless samurai (*rōnin*), emphasized the application of this theory to the political and economic realms. He achieved great success and fame as a reformer in the service of Ikeda Mitsumasa, the lord (*daimyō*) of Bizen Province from 1645-56. However, his unorthodox views and outspoken criticism of what he considered a somewhat oppressive and ineffective government led to his resignation and a life of semi-exile in official disfavour.

His main works are two collections of dialogues on moral philosophy and social problems, commentaries on the Confucian classics, a commentary on the *Tale of Genji*, and the *Daigaku Wakumon (Dialogues on Learning)*, a series of dialogues on contemporary social, political and economic issues which was long suppressed by the Tokugawa authorities. The latter text, the title of which refers to questions concerning the Confucian classic *Daxue (Great Learning)*, actually consists of Kumazawa's recommendations for restoring vitality to government, prestige to the ruling *samurai* class, self-identity and fairness to the peasant farmers and protection for the isolated and vulnerable Japanese nation at risk from possible attacks by the Mongols.

Although a follower of the idealist school, Kumazawa was also influenced by the rival Zhu Xi school of Confucian realism (seeZhu Xi), and he combined a belief in the innate capacity of humanity to grasp truth and choose the correct conduct with an emphasis on the value of empirical knowledge of external reality. In particular, he opposed the shogunate's strict adherence to Confucian ritualism and instead advocated a government dedicated to the genuine pursuit of the Confucian philosophical ideal of *jinsei* (benevolence) and the recognition of individual merit based on performance rather than rank in the conventional class hierarchy. Kumazawa sought to eliminate class discrimination which he considered counter-productive for the shogunate, and he proposed the resettlement of *samurai* on the land, the relaxing of restrictions on the *daimyō* (especially the requirement that they divide their time between their home town and the capital in Tokyo), and the combining of warriors into one class with farmers. In addition, Kumazawa recommended for the proposed *samurai*-farmer class a partial return to rice as the medium of exchange, the storing of rice against drought or invasion, and the construction of flood basins and the afforesting of mountains.

A critic on religious issues as well as a political dissenter, he stressed the abolition of methods for suppressing Christianity and the institution of strict tests for men aspiring to become Buddhist priests. Kumazawa's views exerted a great influence on thinkers and reformers near the end of the Tokugawa shogunate in the mid-nineteenth century.

Kyoto School

The Kyoto school of philosophy pivots around three twentieth-century Japanese thinkers who held chairs of philosophy or religion at Kyoto University: Nishida Kitarō (1870-1945), Tanabe Hajime (1885-1962) and Nishitani Keiji (1900-91). Its principal living representatives, who also held chairs at Kyoto until their retirement, are Takeuchi Yoshinori (1913-) and Ueda Shizuteru (1926-). The keynote of the school was struck by Nishida in his attempt, on the one hand, to offer a distinctively Eastern contribution to the Western philosophical tradition by bringing key Buddhist concepts to bear on traditional philosophical questions, and on the other, to enrich Buddhist self-understanding by submitting it to the rigours of European philosophy.

The name 'Kyoto school' was coined in 1932 by the Marxist philosopher Tosaka Jun (1900-45) to denounce what he saw as a bourgeois ideology - which he characterized as 'hermeneutical, transhistorical, formalistic, romantic, and phenomenological' - that had grown up around Nishida, Tanabe and their immediate disciples at the time. These latter included Miki Kiyoshi (1897-1945), Kosaka Masaaki (1900-69) and Koyama Iwao (1905-93) as well as the young Nishitani. At the time the Japanese state had taken its first definitive steps in the direction of a militaristic nationalism that would involve it in the 'fifteen-year war' with Asia and finally the West over the period 1930-45. As the leading philosophical movement in Japan, the Kyoto school was caught up in this history, although there was little unanimity among the responses of the principal figures.

Postwar criticisms and purges of the Japanese intelligentsia attached a certain stigma to the school's name, but later and more studied examination of those events, as well as the enthusiastic reception of translations of their works into Western languages, has done much to ensure a more balanced appraisal. Today, the philosophy of the Kyoto-school thinkers is recognized as an important contribution to the history of world philosophy whose 'nationalistic' elements are best recognized as secondary, or at least as an unnecessary trivialization of its fundamental inspirations.

As a school of thought, the common defining characteristics of the Kyoto school may be seen in an overlap of four nodal concerns: self-awareness, the logic of affirmation-in-negation, absolute nothingness and historicity.

1 Survey

The story of Western philosophy in Japan began just over one hundred years ago with the general opening up of Japan after more than two centuries of isolation from the rest of the world. As young scholars went to Europe to study, and philosophical literature became available, the currents of neo-Kantian and neo-Hegelian thought (see Neo-Kantianism; Hegelianism) opened a gateway to Greek, medieval and modern philosophy, almost all of which was read in the Western languages. These ideas were taken over by Buddhist thinkers anxious to update their self-understanding. While most of the work of these early pioneers was premature and uncritical, they charted a course which within a generation would produce its first original thinker in the person of Nishida Kitarō.

Like others of his age, Nishida's initial interests were in British empiricism and positivism, but by the time he began at Tokyo University, German philosophy was in vogue (even though the medium of instruction for foreign professors was English). After graduating in 1894 and before taking up employment, he had the idea of writing a book to introduce the ethical theory of the British philosopher T.H. Green to the general Japanese reading public. Although much of the subtlety of Green's language and thought was lost on the young Nishida, leading him to abandon the project in mid-stream, the association of theories of the good and the Hegelian dialectic struck a chord that resonated in him for the next fifteen years, culminating in the publication of his maiden work, *Zen no kenkyū (A Study of the Good)*, in 1911.

In general, the most important intellectual influences during these years were Bergson, William James and Hegel. However, the critical catalyst that convinced Nishida to strike out creatively in his own direction came from quite another quarter. For at least ten years, beginning in 1896, he practised meditation under a Zen master and was assigned the koan *mu*, or 'nothingness'. While there is little evidence that the variety of Zen systems of thoughts as such influenced the maturation of his philosophical ideas, the discipline of meditation was decisive. On the one hand, it convinced him that philosophy does not begin in knowing *about* things through the medium of objective logic, but in the knowing *of* things through the medium of direct experience. On the other, it showed him that

philosophy does not end there, in ineffability, but only begins its work of expressing as clearly as possible the structure of reality and the place of human meaning and action within it. For if the pure ideas transplanted from Western philosophy needed to sink roots in the lived experience of Japan, so did the kind of pure experiencing cultivated in Buddhist meditation need to mature into self-expression under the critical eye of philosophical thinking (see Buddhist philosophy, Japanese).

This ideal of bringing pure experience and clear understanding to bear on one another was the hallmark of the *Zen no kenkyū* and runs throughout all Nishida's philosophy. If Nishida's thinking straddles East and West, it does not do so on the naive supposition that the one can be made to supply what the other lacks. The fact that he chose the term 'pure experience' from James to express the direct experience he had come to know through Zen, and the Buddhist idea of 'nothingness' to clarify Western ideas about the ultimate ground of understanding, shows that the standpoint he sought was finally philosophical in the proper sense of the term. It was a standpoint that transcended East and West, not in the sense that it bleared distinctions of culture and tradition, but in the sense that it pointed to the aim of clear thinking in all culture and tradition as a lived 'religious' expression, in word and deed, of universal ideas. Through his disciples Tanabe Hajime and Nishitani Keiji, this standpoint distanced itself from Nishida's person and mode of expression to become a forum for thought of great variety, but never lost the religious-philosophical stamp that Nishida had given it.

Although Nishida himself never left Japan, he encouraged Tanabe to go to Germany. There the latter studied Husserl, Cohen and Natorp, and became close to Heidegger. The religious character of Tanabe's philosophic concerns was not associated with any particular Buddhist sect, though he favoured the Sōtō Zen of Dōgen more than the koan-centred Zen of the Rinzai sect, and later turned enthusiastically to Pure Land Buddhism and Christianity for philosophical inspiration. The unifying factor for him was Hegelian logic and dialectic. Nishitani, who also later studied in Germany, took an early interest in Nietzsche, whose thought had an enduring impact on him. Like Nishida, Nishitani's primary connection with Buddhism was Zen, both Rinzai and Sōtō; but like Tanabe, Nishitani wrestled with Christian ideas through most of his mature years, mainly through his reading of the mystics and the European existentialists.

Takeuchi's religious frame of reference has consistently been that of Pure Land Buddhism (it was through his influence that his teacher, Tanabe, took to reading Shinran), seasoned by a studied reading of modern Christian theologians such as Bultmann and Tillich. With encouragement from Nishitani, Ueda studied in Germany and wrote a doctoral thesis on Meister Eckhart. During his teaching career he wrote mainly on Zen and Christian mysticism, but since retirement has concentrated on invigorating interest in Nishida's philosophy as such. In both Takeuchi and Ueda we find less of the kind of direct engagement with Western philosophical ideas that we find in Nishida and Tanabe, and practically none of the sort of textual analysis we see in Nishida's struggles with neo-Kantian thought or Nishitani's studies on Aristotle and Descartes. In their case, the influence of Western philosophy has been filtered through their reading of Nishida and Tanabe, who are now recognized as world-class philosophers in the Western sense of the term. Far from indicating a dilution of Nishida's original inspiration, their relative distance from the West shows the sense in which the Kyoto school has turned in the direction of thought that can be approached philosophically on its own merits, without the need to establish credibility through the study of major Western thinkers.

Despite the constant presence of Western intellectual history in the writings of the Kyoto school philosophers and their insistence on the role that Japanese thought has to play in the world philosophical forum, dialogue with their philosophical contemporaries outside Japan played a surprisingly insignificant role in the development of their thought. Differences between their respective positions and debate over those differences neither solicited nor attracted the attention of the philosophical community of Europe and the United States, let alone of other Asian countries. In part this was due to the inaccessibility, until quite recently, of their works in Western languages. In part it was also due to the largely tacit assumption that only the Buddhist East, and perhaps only Japan, as the sole country to engage in modernization freely and without the pressures of colonial rule, was equipped to produce a philosophy that can bridge East and West.

The launching of the Kyoto school, and hence Japanese philosophy, into the world philosophical forum was not the result of determined efforts by the philosophers themselves, but of initiatives from their Western counterparts in philosophy and religious studies. A flurry of translations, as well as a wave of young scholars from Western

countries trained to read the original texts and converse in Japanese, not only brought their philosophy to the attention of the world community but prompted a revival of interest in the Kyoto school philosophers in Japan. Ironically, it has only been after the passing of Nishida, Tanabe and Nishitani that the philosophy of the Kyoto school has passed from the stage of being a Japanese event witnessed by a privileged few who knew the language, to a common forum of ideas in which philosophers from around the world can discuss and debate.

Given the relative isolation of the writings of the Kyoto school philosophers from direct criticism by their contemporaries abroad, their thought was free to take new directions that might not have occurred to them under the monitoring of foreign tutors. Similarly, the lack of affinities between their own language and ancient Greek and Latin, and the lack of popular currency to the vocabulary created to translate Western philosophical terminology, gave an entirely different flavour to the linguistic frame within which they worked. The borrowed vocabulary was generally translated taking only the flat, surface meaning, with no thought to associations of feeling or history or literary allusion. Despite its claims to indigenous thinking, their language is barely less alien to those untrained in its meanings than was the rest of Western philosophy.

On the positive side, the etymology and historical resonances of the Chinese characters suggested different associations, and led them in directions that the retranslation of their works back into Western languages all but entirely gloss over. Well before Heidegger’s works were translated into English, and even while the battles over how to render his wordplays into acceptable idiom were raging in the West, the Japanese showed their natural affinity for his attempts to disclose the wonderful world within worlds of language.

At the same time, their inheritance of modern philosophical questions - from epistemology and the philosophy of science to existentialism and the overcoming of metaphysics - allowed certain questions to pass by unnoticed. In this regard, one thinks particularly of the question of criteria for distinguishing literal truth from symbolic truth. Their failure to concern themselves with symbolic theory in general, and with demythologizing religious truth or distinguishing faith from rationalism in particular, made it possible for them to work from a standpoint of ‘philosophy-religion’ that is not so easily taken by theologians or philosophers in the West.

2 Self-awareness

As noted above, Nishida’s concern with Western philosophy stemmed from the need for an objective standpoint from which to rethink, systematically and rigorously, the experience of being rational within an Eastern, and in particular a Japanese, culture. Though his writings make few direct references to Zen, in his lectures he is reported to have defined his philosophical aim as seeking a rational foundation for the Zen experience of enlightenment. The term he chose for this, ‘self-awareness’ (*jijaku*), is an ordinary word in Japanese which had loose ties to Buddhist and Western philosophical thought but had not been preempted as technical jargon by either of them. On this term he laid the burden of resisting the self-understanding being urged on Japan from the outside world and at the same time of submitting vernacular patterns of self-understanding to as serious a critique as possible. In this sense, it was less a clearly defined concept than a kind of bridge that allowed him to move back and forth freely between two worlds of ideas and forge a philosophy of his own. Moreover, because of its inherent ambiguity, the term provides a kind of symbolic connection between Nishida and his disciples, even when other differences of opinion seem to pull them far apart.

The designation of awareness as *self*-awareness is more than the result of literal translation. It draws attention to two important traits of enlightened consciousness for Nishida. First, it was an awareness that comes about *of itself*, without the interposition of judgment or discursive knowing on the part of the individual. It is an event, not the result of any systematic technique of reflection; it is the foundation of the philosophic enterprise, not the aim. Second, the awareness is without any ‘object’ that distinguishes it from the ‘subject’ of the awareness. It is, one might say, an awareness of awareness itself, not of any one that is aware or about any thing that is the focus of consciousness. In other words, it is the state of pure experience prior to the distinctions and judgments that begin with the distinction of any experiencing subject and an experienced object.

In his early writings, Nishida spoke of this refinement of everyday subjectivity into self-awareness as the discovery of the ‘true self’, a no less ambiguous yet symbolically important term that appears commonly in the work of both Tanabe and Nishitani as well. The more he threw himself into the Western intellectual tradition, the more he recognized cognates there for the notion of a self that loses itself in being aware of itself, and thus

gradually gave up allusions to its distinctively Buddhist quality. His focus shifted rather to seeing the knowing, feeling and experiencing self of ordinary consciousness as the maidservant of self-awareness, in effect inverting Western philosophy as he knew it.

Nishitani took up this concern with the true self and the attainment of an awakened subjectivity in serious confrontation with Western philosophical texts. At the same time, he delved deeper into Zen Buddhist literature in search of connections between self-awareness of one's true self and the enlightenment experience. For Nishitani, self-awareness consisted of a 'realization' that entailed both *really* coming to one's senses and a coming to *reality* just as it is. Awakening to this self means that consciousness 'sees' itself as an event in reality even as it 'sees through' any attempt to set itself over against the incessant change and interdependence of all things that are in the world of being. It is not ordinary consciousness, which sets itself up as a knower of the world to be known and hence puts itself in a position to change it, but a sort of consciousness of being conscious in the world. In this sense, as Nishitani points out, self-awareness is not the awareness of a self set up in opposition to another, but of a true self in which self and other are no longer two. He contrasted this self as a 'letting go of ego', by which he meant not simply ridding oneself of selfishness or uncluttering the everyday mind, but of 'breaking through' of ego in its highest form (for Nishitani, this is the Cartesian ego) (see Descartes, R.). The latter term, adopted from Meister Eckhart, shows how Nishitani did not hesitate to point out equivalent critiques of the ego in the Christian tradition and to apply them to clarifying classical Buddhist notions.

In Tanabe, the use of the terms 'self-awareness' and 'true self' was less self-conscious than it was in Nishida and Nishitani until he came to his project of revitalizing philosophy as a 'metanoetics'. There self-awareness is seen less as an immediately accessible, primordial state than as the disciplined, deliberate letting go of the 'self that is not a self' through reason exhausting itself on its own principles. In his later writings he used the notion deliberately to stress his differences from Nishida, but the basic meaning, and the fact that it was the lodestone of true philosophical thought, were never questioned.

3 The logic of affirmation-in-negation

In giving self-awareness a central place and all but identifying it with religious experience, Nishida distanced himself from the classical Western distinction between faith and reason. At the same time, he rejected the hasty appeals to the transrational or paradox in which Zen and other Eastern philosophies have often found a convenient retreat from criticism. Rather, he recognized the need to introduce a new logic to complement the two-valued logic of affirmation-or-negation that he found in his Western counterparts. His aim was, as he said, to give 'philosophical moorings' to the centuries-old preoccupation of Eastern cultures with such things as the 'form of the formless' or the 'voice of the voiceless'. This new logic was one of affirmation-in-negation and negation-in-affirmation (see Logic in Japan).

The grammatical index of this logical relationship was the Sino-Japanese copula *soku* (rendered here as 'a-*in*-b') which Nishida used freely but did not assign an explicit place in formal logic. The most succinct statement of the *soku* logic is given by D.T. Suzuki, Nishida's friend from high school days: '*A* is not *A*, therefore *A* is *A*'. The point is not to deny the principle of contradiction by claiming that '*A* is *A*' and '*A* is not *A*' mean the same thing; nor is it simply to assert that ultimately there is nothing in the complexity of the real world that corresponds to the logical form '*A* is *A*'. Nishida did not mean to reject the need for abstract and logically regulated thinking. His point was rather to insist that the 'identity' of a thing is not contained within a thing itself, as a kind of self-subsistent fact waiting for the mind to discover it, but is always a function of its interaction with what it is not. This identity is therefore not something that can be grasped by a logically thinking subject passing judgment on a perceived object, but only in an act of self-awareness in which the logical affirmation of the thinking subject is taken up into an experience that erases the distinction between subject and object, between affirmation and negation. It is only after one has seen that '*A* is not *A*' that one is able to return to subjective judgment to understand what is meant by the claim that '*A* is *A*'.

This act of seeing that '*A* is not *A*' preoccupied Nishida for several years during which he concentrated his attentions on a process he called 'acting intuition'. Briefly put, his idea was that pure intuition needs to be deliberately *cultivated* as a way of acting on the world, participating in the world's dynamic by expressing it in creative form, without interposing the subject-object dichotomy on it. Nishida describes this as a 'seeing without a seer' and of 'knowing a thing by becoming it'. Later he used the term 'self-identity of absolute contradictories' as

a general index of the *soku* logic and its corresponding epistemological theory.

Tanabe took up the *soku* logic as a way for him to appropriate the Hegelian dialectic without succumbing to its assumptions about an unfolding of Being and consciousness in which the opposites are subsumed into a higher unity. (In fact, one of his points of disagreement with Nishida was what he saw as the reintroduction of a quasi-Plotinean One in the idea of the self-identity of absolute contradictories (see Plotinus §3).) Tanabe set the *soku* relationship in the context of a broader logic of what he called 'absolute mediation', his own alternative to the logic of non-contradiction. Like Nishida, he insisted that logic is a way of seeing that only makes sense when it is engaged in the seen, but he went further to see affirmation-in-negation as a function of a reality that is always in the making. The mutual mediation among things, their *soku* relationship, propels them through time and gives the lie to simple noncontradiction, but is also itself a part of the process. It is 'absolute' precisely in the sense that it does not stand above the process it enables. Hence while it governs contradictories like death-in-life, the *soku* relationship also applies to identities that do not involve contradiction, such as God-in-love.

While Nishitani was never persuaded that Tanabe's idea of absolute mediation corrected a fault in Nishida's logic of *soku* and tended to use it as a copula between absolute contradictories, neither did he adopt the latter's terminology in his own philosophical writings. Moreover, like Nishida, he tended to see the *soku* statement as an index of a realization which precludes the working of the objectifying ego and its principle of noncontradiction.

4 Absolute nothingness

If there is one idea that has been associated with the Kyoto school of philosophy more than any other, it is that of absolute nothingness. Nishida's introduction of the notion into philosophy seems to have been motivated by his wish to remove traces of psychologism or idealism that were present in his early writings (see Nishida Kitarō). Rather than have recourse to the Western notion of Being as a universal that would embrace both mind and the reality that it perceives or expresses, he turned to the Buddhist idea of nothingness and moulded it into an absolute that could answer philosophical questions generated outside of the Buddhist tradition (see Buddhist concept of emptiness).

In the Western philosophical heritage, nothingness has been defined in terms of Being and for the most part made subservient to Being as a privative (see Being). Its positive side is most often caught by notions of nonexistent potentialities, ideals or aims. Wherever becoming is stressed as the correlative of being, at least a minimal idea of nothingness is present. None of this contradicts Nishida's use, but neither does it come close to exhausting it.

As an idea, the designation of nothingness or emptiness (*kū* in Japanese; in Sanskrit, *śūnyatā*) as 'absolute' is nothing new to Zen or to Mahāyāna Buddhism in general, and related ideas can be found in Daoist classics as well. However, the particular term (*zettai*) that Nishida used was a translation of the Hegelian 'Absolute', and is not found in the Chinese Buddhist canon. The term means literally 'without an opposing other', while the classical Chinese term found in Sanlun meant 'without dependency'. As a pure logical relation, Nishida's absolute does not contradict its use in Schelling and Hegel, through whom the notion of the Absolute was introduced into philosophy, although he uses it differently and does not arrive at the ontological conclusions of these latter (see Absolute, the; Hegelianism). Indeed, the notion is not ontological at all, since that would reintroduce it as a subsidiary of being; rather, it is a principle that belongs to self-awareness. It is not a being or state of being or even the absence of them; it is a transcendence of the perspective of being that is meant to forfeit none of the possibility of being found in Being.

In the Kyoto philosophers, then, the idea of nothingness is cut off - that is, 'absolutized' - from its dependency on the idea of Being and set up in its place as the supreme ontological principle. The roles are thus reversed: nothingness takes over the centrality of Being, which is always dependent on an 'other' defined in terms of nothingness. To carry out this reversal in the context of philosophy, the thinkers of the Kyoto school were obliged to turn to Eastern thought, particularly Buddhism, for guidance. In this way it developed variously in each of them, suggesting that absolute nothingness can produce the same plurality of philosophies as being is able to.

For Nishida, absolute nothing belonged to his overall logic of place, a model of ever widening concentric contexts aimed at 'locating' self-awareness in reality. The first context inverts the fundamental bias of Western logic, which focuses judgment on the substantial individual, the particular (grammatical subject) that cannot become a universal (predicate) (see Universals). For Nishida, self-awareness begins in focusing on the universal that deabsolutizes the

existence of the individual. This horizon widens when self-awareness turns attention to the basic locus of universals, which is no longer in the world of individuals but only in the nothingness of consciousness. The only ‘being’ universals retain is that of events in consciousness. Thus the need to open the perspective still further, to deabsolutize consciousness by locating it in a wider context. This final, circumferenceless circle transcends the contents of consciousness altogether and opens into a universal of all universals. This is absolute nothingness. It is not any relative thing or any relative state of consciousness, but the ultimate homeground of reality itself, beyond being and our conscious judgments about it. In the logic of place, absolute nothingness is the crowning context in which everything else is ‘located’. It is none other than the locus of enlightenment itself, and in that sense becomes part of a single philosophy the religious-experiential and the philosophical-reflective.

Like Nishida, Tanabe accepted absolute nothingness as the final ground of reality, but for him this ground was essentially dynamic. That is, it is the actual ‘working’ of absolute mediation, known not by direct intuition but through its effects, namely the interdependency of the haphazard items that make up reality as we experience it. In other words, without the world of being, absolute nothingness would be static; and the world of being can only function because it is *not* nothingness. This was for Tanabe the principle behind all transformation, both personal and historical, which is always a form of being-in-nothingness.

The absoluteness of nothingness is not merely a logical quality but, for Tanabe, points to the religious dimension of the fundamentally social nature of all reality. This religious dimension was decidedly not mystical, but always practical. Positively, this meant that for the dynamism of absolute nothingness to be truly salvific required the cooperation of the individual conscience in the social world. Negatively, it meant that the progress of virtue in human society was ultimately not the work of the members who make it up or of particular structures that govern it, but of an absolute nothingness functioning as what Pure Land Buddhism calls ‘Other-power’.

Nishitani’s work represents a major advance in the idea of absolute nothingness (see Nishitani Keiji). This appears in two principal forms. On the one hand, he drew the idea closer to its Buddhist background by relating it directly to the Buddhist idea of emptiness, particularly in its Zen formulations. Throughout his mature writing he speaks of the ‘standpoint of emptiness’ as the locus from which self-awareness comes to realization. On the other, he was at pains to locate absolute nothingness squarely in the existential struggle of contemporary consciousness. The course of this struggle is laid out most clearly in his major work, *Shūkyō to wa nani ka (Religion and Nothingness)*. There the ordinary, pre-awakened self is described as the ego of self-consciousness that sets itself up outside the world of things as a knowing subject. This is the standpoint of ‘egoity’. Driven by death and an awareness of the impermanence of all things to see the empty abyss that yawns underfoot of ordinary egoity, one awakens next to an initial sense of the vanity of self and world. This is what Nishitani calls the standpoint of ‘nihility’, whose philosopher-saint was Nietzsche (see Nihilism). It represents a conversion to a standpoint of nothingness, but only a *relative* nothingness. By facing this abyss of nihility squarely and yet not clinging to it as ultimate, we open up a final standpoint, that of ‘emptiness’ as such in which things appear just as they are, in their ‘suchness’, and in which the true self is seen to reside not in the workings of egoity but in a letting go of ego. The awareness of the relative nothingness of nihility is converted spontaneously and of its own - it is, as noted above, a *self*-awareness - to an awareness of absolute nothingness as the ground of reality.

Using this model of religious conversion, Nishitani took up key notions of self and self-nature in Zen Buddhism, as well as their conceptual counterparts in Western philosophy and theology. His reflections on the impersonality of God, the kenosis of God in Jesus, and even the immaculate conception of the Virgin Mary draw freely on the Western mystical tradition, but in the end rest on his Buddhist strategy of emptying language into self-awareness of the true self.

5 Historicity

At the time that Nishida was producing his major work, the notion of historicity most dominant in Japanese philosophy was that of Marxism (see Marx, K.; History, philosophy of). The influence of Marxist thought was perhaps mostly immediately associated with the person of Miki Kiyoshi, who enjoyed amicable relations with Nishida. Nishida did not employ Marxist-style analysis in his own thought, and seems to have considered it something of a distraction. His own position offered an alternative on two fronts. First, on the abstract level, he saw the actual production of history as the self-identity of the temporal opposites of past and future and the spatial opposites of the bodily self and the natural environment, both of which are a kind of continuity-in-discontinuity.

Second, on the concrete level, he saw the need for something like an Eternal Now or absolute present to synthesize the contradictions of history as a self-expression of reality in the making (not yet) on the one hand, and as a self-negation of reality (has been) on the other. This he gathered under the rubric of ‘tradition’, in which the specific *ethnos* of particular peoples would be made manifest, and the combination of these specific peoples would constitute a global world. In Japan’s case, this tradition centred on the Imperial Throne.

Whatever consolation the subtlety of his language afforded Nishida personally during the heavy censorship of the war years (the emperor’s place in Japanese self-consciousness was referred to as a ‘self-identity of contradictories’, omitting the qualifier ‘absolute’), it was lost on nearly everyone else, particularly on his postwar critics. At the height of the war his prestige gave him access to leading political figures, some of whom had studied under him, and although they protected him, in the end he despaired of their ability to act objectively.

Tanabe was still less drawn to struggle with Marxist thought, but more than Nishida - or at least earlier than Nishida - he struggled with bringing the element of historicity into philosophy through his notion of ‘the specific’. In the context of history, this meant that the universal (humanity) and the particular (the human individual) are related to one another concretely in the form of particular cultures, languages and ethnic particularity. For Tanabe, this specific substratum, insofar as it was functional, was nonrational; and insofar as it was unreflected, was susceptible to manipulation by rational ideologies. At the same time, even though he made it clear that the ultimate foundation of the specific was not any particular historical relative situation, but absolute nothingness, he also saw that this latter needs expression in the specific in order to be known.

More than anything Nishida had written, this idea of Tanabe’s seemed to suit Japan’s growing imperialistic ideology insofar as it stressed the specific as the most real experience of history and even regarded the emperor as a unifying symbol of its foundations in an absolute, with the result that concern for the wider human community and broader humanitarian questions tended to be relegated to a more abstract and ahistorical plane. Tanabe himself yielded to this tendency in the early years of the Pacific war. Later, as the war was drawing to a close, he publicly repented in his *Zangedō to shite no tetsugaku (Philosophy as Metanoetics)*, in which he spoke of the need to historicize philosophy by first negating it as a powerless, weak-willed enterprise that has nothing to say in time of crisis, and then reaffirming it as a letting go of self. That step having been taken, he later returned to his notion of the specific, but was never quite able to remove the shadow that the war experience had cast over this important idea for the history of philosophy.

Nishitani’s ideas on the philosophy of history developed in the opposite direction from those of Nishida. As a young professor thrust into the thick of the debate over Japan’s philosophy of ‘all-out war’, recorded in the pages of the journal *Chūōkōron* in 1941 and 1942, he had not yet worked out a mature position of his own and lapsed into remarks that seem to smack of the very nationalism that was at the heart of the militarist ideology. After the war, having suffered censorship and a temporary purge from his post in Kyoto University, he wrote a number of essays on nationalism, adopting a position close to the globalism of Nishida and the critique of the specific found in Tanabe. It was only when this was behind him, however, that he was able to forge a view of history more properly in line with his standpoint of emptiness, and without the spectre of nationalism lingering in the background. Nishitani offered Zen as a corrective to what he called the ‘optical illusion’ of Western linear notions of history, which look backwards to an absolute beginning or forward to an absolute end of history. It is only in the self-awareness of the ground of history as resting underfoot in the direct immediacy of the present that we can shake off the anthropocentric myths of scientific progress, special election and irreligious secularism that infect modern consciousness.

Whether or not the approach of the Kyoto school philosophers to Western philosophy will have the lasting, positive effect on Buddhist self-understanding they intended it to, and whether or not their revision of classical philosophical themes from a Buddhist perspective will have any lasting impact on philosophical thought outside Japan, are questions too large to pronounce on summarily. No doubt many of their ideas need to be broken down for scholars to assess and examine in further detail. However, their vision remains an important contribution, indeed the first important contribution, of Japan to world philosophy.

La Forge, Louis de (1632-66)

Louis de la Forge, a medical doctor by profession, was an important champion of Cartesian philosophy in mid-seventeenth century France. Through his work on the first published edition of Descartes' Traité de l'homme, as well as in his own Traité de l'esprit de l'homme, La Forge sought to complete Descartes' project of giving a full and detailed account of the human being as a union of two essentially distinct substances: mind and body. His analysis of causation introduced occasionalist elements into his otherwise orthodox Cartesian system, and he is credited with being one of the originators of occasionalism.

Louis de la Forge was born in November 1632 in La Flèche, France. As a young man he was captivated by Descartes' philosophy. When, in 1653, he moved to the intellectually lively environment of Saumur (with its schools and academies) to set up his medical practice, he quickly became known primarily as a fervent champion of Cartesian thought. In his published works he assumed the task of faithfully completing Descartes' unfinished project of giving a full and detailed account of the human being, considered particularly as a union of two radically distinct substances: mind and body (see Descartes, R. §8). At the request of Claude Clerselier, Descartes' friend, he helped to edit and draw the figures for the first published edition of Descartes' *Traité de l'homme*, which appeared in 1664 with La Forge's own critical notes. To supplement this work (which considers only the physical functions and processes of the human body, treated in purely mechanistic terms) La Forge composed his own *Traité de l'esprit de l'homme* (1665), in which he considers the soul itself, its union with the body, and all the phenomena that derive from their mutual interaction. This gained him an international reputation as one of the originators of occasionalism (see Occasionalism). His philosophical career, however, was cut short by his death in 1666.

While La Forge was not a particularly original thinker, he was not, on the other hand, an uncritical or unimaginative disciple of Descartes. His figures and notes to the *Traité de l'homme* occasionally correct his mentor. His most important philosophical contribution lies in his discussion of causation, both as it relates to bodies and in connection with the interaction of mind and body. While modest about his accomplishments and eager to remain as faithful as possible to Descartes' doctrines, La Forge went deeper than did Descartes himself into certain metaphysical problems facing Cartesian mechanism and dualism.

La Forge begins the *Traité de l'esprit de l'homme* by considering the soul itself, including its immateriality, its cognitive and volitional functions and its immortality. He then turns to the soul's union with the body. Any union between two substances consists in a certain mutual dependence of their states, a relative correlation of action and passion. In the case of bodies, it is their local contact that establishes this dependence. In the case of minds, love accounts for the fact that one mind wills what another mind wills. A mind and a body are united when thoughts in the former depend upon motions in the latter, and vice versa. The immediate explanation of these mutual dependencies is causal. In the case of bodies and of minds, where the effect resembles the cause, it is a matter of what (employing a medieval distinction) he calls 'univocal causation'. In the mind-body case, since the effect does not resemble the cause, it is 'equivocal causation'. But La Forge then considers the nature of causality itself, and here he turns to God. *Prima facie*, causal relations between bodies appear to have an intelligibility that is lacking in the body-mind case, since we think that we can understand how one body can communicate motion to another body. In fact, genuine body-body causation is no more intelligible or possible than body-mind causation, and all species of causal relationship have their ultimate ground in the divine will.

With respect to body-body relations, La Forge adopts an occasionalist solution. A body, according to the orthodox Cartesian schema that La Forge follows, is nothing more than pure extension, devoid of any spiritual properties (thoughts, desires, will). Thus, a body is, by nature, inert and passive, and has absolutely no active motive force, no power to put itself in motion. This is particularly clear when we consider that all the properties of body must be understood in terms of its underlying essence: extension. And while this is possible for such properties as size, shape, internal figure and mobility, it is clearly not possible for active force. But if bodies cannot move themselves, then they cannot move other bodies. Moreover, the motion of a body is simply a modification of its substance, and (on the Cartesian ontology) modes cannot pass from the substance to which they belong to some other substance. Thus, real transitive causation - whereby one body would communicate its motion to another - is

ruled out.

La Forge's strongest argument on this issue is based on principles concerning divine sustenance that he inherits from Descartes (see Descartes, R. §6). God, he insists, is required not just to create the world *ex nihilo*, but to sustain it in existence from moment to moment by a kind of continuous production. This applies, as well, to all the particular substances in the world. When God creates or sustains a body at a given time, he must do so in some relative place or another. But it follows, then, that the motion of a body is just its being sustained or recreated by God from one moment to the next in different successive relative places. The force that moves a body can only be the will of God, and the local contact of a body in motion with another that is at rest is only an occasion for God to modify the motion of the first body and to put the second body into motion, as dictated by the laws of nature.

While La Forge does bring God into the picture in the other two causal contexts, it is not in such an occasionalist manner. The body plays a causal role in the generation of sensations in the mind, but only in so far as the motions communicated to the brain 'occasion' the mind to bring about a sensory idea. Thus, while the body is the occasional cause of the idea, the mind is the real efficient cause. God is required in order to institute this causal body-mind relationship in the first place (and, subsequently, to sustain it), but not to be the direct efficient cause of the mental event on the occasion of the bodily event. God has also given to the soul - an active substance - the power to move the body by its volitions, without the need of constant divine involvement. In each of these cases, La Forge appears to be entirely faithful to Descartes.

La Forge's analysis of causation was of great importance in the development of occasionalism, and some of his arguments reappear without acknowledgement in Malebranche's deeper and more systematic occasionalist doctrine (see Malebranche, N. §4). Leibniz, for one, recognized La Forge's originality here, and ascribed to him (along with Cordemoy) significant modifications to the Cartesian system.

La Mettrie, Julien Offroy de (1709-51)

La Mettrie is best known as the author of the eighteenth-century materialist manifesto, L'Homme machine (1747). His interest in philosophical issues grew out of his preoccupation with medicine, and he developed a tradition of medical materialism within the French Enlightenment. Born in St Malo, into the family of a prosperous textile merchant, La Mettrie pursued a medical career in Paris. He also studied for two years with the renowned Hermann Boerhaave in Leiden. After a brief period of medical practice, La Mettrie devoted his efforts to his translations and commentaries on Boerhaave's medical works. He also began to publish the works that made him a pariah to both the Faculty of Medicine of Paris and to the orthodox - that is, his medical satires and his first work of materialist philosophy, L'Histoire naturelle de l'âme *(1745). Because of the outrage provoked by these works, he was exiled to Holland in 1745. But L'Homme machine, the text in which he applied his materialism thoroughly and explicitly to human beings, was too radical even for the unusually tolerant Dutch, and La Mettrie was forced to seek asylum at the court of Frederick the Great where he later died. His willingness to publish ideas his contemporaries considered too dangerous led the* philosophes *to repudiate him.*

1 Medical roots of materialism

La Mettrie's best known work, *L'Homme machine* (1747), has sometimes been construed, largely because of its title, as a simple application to man of Descartes' *bête machine* hypothesis (see Descartes, R. §12). But his materialism is richer, less mechanistic, and more embedded in the scientific and medical traditions of the eighteenth century than this narrow appreciation has suggested.

La Mettrie's interest in philosophical issues grew out of his preoccupation with medicine. His medical works include translations and commentaries on Boerhaave's principal works, five medical treatises on specific diseases and public health, and seven volumes of medical satires lampooning the ignorance and venality of the medical profession. His work manifests the hostility to metaphysics and commitment to an empiricism typical of many medical writers in the eighteenth century. His awareness of the divergent manifestations of disease in different individuals led him to emphasize the importance of the physiological constitution in his philosophical works. La Mettrie built upon Boerhaave's tentative correlations between Lockean epistemology and the physiology of mental process to develop a materialist philosophy. That is to say, he not only adopted Lockean psychology as the best framework within which to discuss brain functions but also made the easy transition from Locke to materialism; in all of his philosophical writings, he emphasized the physiological evidence for taking this step.

2 Materialist philosophy

La Mettrie's first philosophical work, *L'Histoire naturelle de l'âme* (1745), appears to be a conventional metaphysical treatise in style and vocabulary. But he deliberately subverted conventional philosophical arguments to argue for materialism, perhaps attempting to legitimate materialism by placing it within the established philosophical canon (see Materialism in the philosophy of mind). For example, he claimed that Aristotelian substantial forms - defined as the power of matter to acquire form, force, and the faculty of sensation - prefigured his materialism. He used the Aristotelian sensitive soul as a fruitful way to discuss mental processes and cited, as an epistemological rallying cry, the Aristotelian maxim, 'nothing in the intellect which is not first in the senses'. He wielded his materialist reading of Locke as a weapon against seventeenth-century metaphysicians, especially Leibniz and Descartes, to argue that the soul could be completely identified with the physical functions of the body and that any claims about its existence or function must be substantiated through physiology. Without the impediment to research and understanding that the notion of the immortal soul posed, one could come to a more realistic assessment of human nature by studying all available scientific data. Writing as a physician committed to the practical application of empirical physiology to investigations of human nature and the soul, La Mettrie reappraised philosophical issues with the evidence and methods of medicine and physiology.

In *L'Homme machine* (1747), La Mettrie adopted a freer and more polemical style to canvass all the scientific issues of his day for empirical evidence for materialism. He provided lengthy and elaborate discussion of the physical basis of human behaviour in order to demonstrate that the effects of the body on the soul are so striking that one cannot reasonably assume that a soul controls the body; thus one must ultimately conclude that the soul, if the term has any meaning, must be considered part of the body. He used evidence drawn from anatomy,

physiology, and psychology to assert the complete dependence of the soul on the body. Albrecht von Haller's findings on muscular irritability were particularly attractive to La Mettrie as the most conclusive evidence against those who refused to admit that matter was capable of selfmovement, particularly the Cartesians. Making no qualitative distinction between conscious and voluntary and involuntary or instinctual, La Mettrie posited an active, organic, and selfmoving 'man machine'. With his materialist theory of man substantiated by physiological experiments, La Mettrie thoroughly compared human beings to animals, despite the implicit disparagement of conventional notions of man's place in the universe which those comparisons entailed. Furthermore, he suggested that atheism was the logical outcome of his notion of an active, selfcreating and sustaining nature.

La Mettrie's other works on the philosophy of nature, *L'Homme plante* (1748) and *Système d'Epicure* (1750), further integrate human beings in nature by comparing them to lower creatures, like plants, and by placing them in the context of the unfolding of matter and motion in an evolutionary process.

In these works, La Mettrie empowered the physician, at the expense of the theologian and metaphysician, because he maintained that the physician's physiological understanding of human beings was the most sound and most likely to yield productive results. The close connections he was able to draw between physical and mental processes demonstrated the utility of knowledge gleaned by his method, which was unsystematic, incautious and unconstrained by standards of orthodoxy, bound instead by stringent empirical standards - the method, he suggested, of the reform-minded, empiricist physician. La Mettrie then turned his attention to an area where the authority of the metaphysician or the theologian traditionally prevailed over that of the physician, ethics.

3 Moral philosophy

La Mettrie's *Discours sur le bonheur* (1750) used his materialist notion of man and his place in nature to examine the implications of materialism for moral systems and for the individual in society. He raised the question of the effect society can have on the individual or the degree to which education can countervail physiological determinants.

He sought to determine whether our notions of virtue and vice correspond to human nature as revealed by physiology. The evidence of comparative anatomy led him to conclude that society was not only unnatural but also arbitrary, and that its notions of virtue and vice, while socially useful, were fundamentally at odds with nature and simply the result of socialization. Therefore, just as the physician must acknowledge the effects of the individual constitution on health and disease, La Mettrie insists, so too must the moral reformer recognize the limits that the individual constitution imposes on one's ability to behave in the ways society has defined as virtuous. The brunt of La Mettrie's moral argument is the hope that society, recognizing that its notions of virtue and vice are relative and designed merely to further its interests, will be persuaded to reward a greater range of human behaviour; thus, more individuals will be able to aspire to social virtues. In light of his understanding of human nature and morality, La Mettrie critically appraised other moral systems; he indicted Christianity and Stoicism, in particular, for their distorted views of human nature (see Virtues and vices).

4 Role in the Enlightenment

La Mettrie was more pessimistic than other *philosophes* about the possibility of social reform; for him, reform efforts were severely circumscribed by the sway that the physiological constitution exercises over the individual. His specific claim that virtue and vice are completely relative put him at odds with the aspirations of other Enlightenment moralists writing within the natural law tradition, and his hedonistic ethic put him beyond the pale as far as many of his contemporaries were concerned. But despite the fact that virtually all of the*philosophes*, even those like Diderot and d'Holbach who were indebted to him, found it dangerous to be associated with his radical materialism, La Mettrie himself was eager to proclaim his adherence to them. In his last philosophical work, the *Discours préliminaire*, written in 1751 just as the philosophic movement was beginning to coalesce around the *Encyclopedia*, La Mettrie claimed to speak for the *philosophes*. He explicitly identified his work in both medicine and philosophy with their concerns for reform. Where medicine offered hope for a more naturalistic understanding of human nature, the *médecin-philosophe* (a term he coined) might be able to reform social institutions in accord with that understanding. La Mettrie's medical materialism is his distinctive contribution to the French Enlightenment and the history of philosophy.

Labriola, Antonio (1843-1904)

Antonio Labriola was the founder of Italian theoretical Marxism. Generally situated in the Marxism of the Second International, he was more questioning than others in that movement. He profoundly influenced the development of Italian thought, constantly challenging the influential idealism of Benedetto Croce and Giovanni Gentile. His attempt to maintain a place for human creativity within a deterministic Marxist view of history influenced Antonio Gramsci and helped give Italian Eurocommunism its distinctive flexibility. His concepts of 'genetic method', 'social morphology', 'philosophy of praxis' and 'social pedagogy' are indications of this attempt.

Labriola was born in Cassino (near Naples) and studied at the University of Naples. He became Professor of Moral Philosophy and Pedagogy at Rome University in 1874 and remained there until his death. In 1887 he gave lectures in the philosophy of history and two years later began a series of lectures on the French Revolution which had to be suspended when right-wing students demonstrated.

Labriola was taught by Bertrando Spaventa, leader of the Neapolitan Hegelians, who was, however, critical of Hegel's deterministic interpretations (see Hegelianism §4). Labriola adopted a similar position and began to borrow the social psychology of Johann Friedrich Herbart while eschewing his metaphysics. Later, under the impact of reading Karl Marx, Herbart's social psychology was reconceived in terms of class consciousness.

Once he perceived that the Italian middle class in the 1870s were incapable of creating an Italian state which could provide unifying cultural leadership, Labriola rejected the Hegelian notion of the 'Ethical State' (see Hegel, G.W.F. §8) and came to regard class conflict as necessary to social advancement. He leaned towards socialism from 1879, and in 1889 discovered Marx's writings, which were almost unknown in Italy at the time. Everything he had previously learned was now reshaped in Marxist categories.

He corresponded extensively with Friedrich Engels, as well as with Eduard Bernstein and Karl Kautsky attempting to engage Italy with German social democracy. He expounded Marxism in four highly original essays. His third and most insightful essay is composed from correspondence with Georges Sorel, and his final essay was incomplete at his death. Outside Italy his work was ignored, except in Russia, where his essays were applauded by Plekhanov, Lenin and Trotsky. Labriola's work generally re-entered histories of philosophy only as a result of widespread interest in Gramsci's prison notebooks.

Labriola introduced the concepts of 'genetic method', 'social morphology' and 'philosophy of praxis' in an attempt to characterize Marx's method in such a way as to avoid, on the one hand, a rigid materialist determinism and, on the other, the risk of appropriation by Italian Hegelianism. The three concepts are not really new, however, since they correspond to 'materialist method', 'social structure' and 'Marx's dialectic' in the works of Engels and others (see Engels, F. §3).

He saw Marx as having developed a systematic study of specific societies and of their modes of thought as distinctive and coherent wholes. Such study was carried out with the genetic method, which involved laying bare the complex of particular conditions (social morphology) which gives rise to the whole. Although Labriola wanted an empirical Herbartian approach, and was reluctant to speak of a dialectical method, his genetic method closely approximates the method promoted by Engels (see Dialectical materialism).

Labriola took the philosophical kernel of Marxism to be 'the philosophy of praxis', that is, 'the reversal of the Hegelian dialectic', so that thought must be understood in terms of the practice in which it is embedded. For him this implied an entirely novel way of looking at things. Although he understood that thought could shape practice, he failed to avoid the determinism inherent in a metaphysics of history which insisted on the inevitability of the proletarian revolution. It was this same naturalistic evolutionism (albeit distinct from social Darwinism, which he criticized) which led him to advocate Italian colonialism in Africa as a means of raising Italy to the stage necessary for revolution (see Evolutionary theory and social science).

Prior to his adoption of Marxism, Labriola for some years held a government position with responsibilities for the direction of public education. He came to prefer lecturing to workers. He always emphasized progressive popular education ('social pedagogy') and the creation of the cultural conditions for a society more civilized than

capitalism, regarding Marxism as having a central role as a new conception of the world.

Gramsci took his Marxism in large part from Labriola, but rejected his evolutionism. He tried to resolve the methodological difficulty Labriola had encountered with deeper explorations of ‘praxis’ and ‘social pedagogy’.

Lacan, Jacques (1901-81)

Jacques Lacan was a French psychoanalyst and philosopher whose contribution to philosophy derives from his consistent and thoroughgoing reinterpretation of Freud's writings in the light of Heidegger and Hegel as well as structuralist linguistics and anthropology. Whereas Freud himself had disparaged philosophical speculation, claiming for himself the mantle of the natural scientist, Lacan demonstrates psychoanalysis to be a rigorous philosophical position. Specifically, Lacan suggests that the Freudian unconscious is best understood as the effect of language (what he calls, 'the symbolic') upon human behaviour.

Lacan gives the name, 'unconscious' to what necessarily disrupts conscious life. In order to remain true to this disruptive effect, Lacan rejects the falsely reassuring clichés with which the idea of the unconscious has been popularized. He develops an understanding of the unconscious (doubtless strongly influenced by Hegel) that is based upon the difference implied in every identity - a difference conceivable as the 'gap' between the subject and any object that provides an identity to it. Since, according to Lacan, any such space or gap in some sense *belongs to* the object, identification is always imperfect. The effects that Freud associates with the unconscious derive from this imperfection.

Lacan developed his theory of the unconscious in three historical stages and corresponding to three 'fields' that define subjectivity - 'imaginary', 'symbolic' and 'real'. Lacan's major exposition of the idea of the imaginary came (while he was still in training as a psychoanalyst) in the 1936 paper later published as 'The Mirror Stage as Formative of the Function of the I' (in Lacan 1966). In that paper, Lacan posited an imaginary field dramatized by events of mirror identification (with 'images') in pre-verbal infants. The prematurity of human infants - their incapacity, compared with the young of other species, to control their own actions - creates the need for an external model for intentional unity; such is Lacan's explanation of the 'jubilation' of pre-verbal children from 6 months old onwards upon discovering their image either in a mirror or, more typically, in the mimicking gestures of another person.

But the same image that provides the site for jubilation also becomes the object of what Lacan calls 'aggressivity' - a proto-agression directed at the object of identification. For Lacan, such aggressivity results from the 'alienation' of that locus - the ego - where imaginary identification forms intentional unity. That is, in Lacanian theory the ego is first of all an object, the object in which the subject finds a 'self.' Because the ego can only appear as an object - as an other - its emergence also, according to Lacan, occasions the formation of a primordial violence directed against it.

Lacan's work in the 1950s, starting with the so-called, 'Rome Discourse' - the essay later published under the title of 'Function and Field of Speech and Language in Psychoanalysis' (in Lacan 1966) - elaborates a new dimension in his thought, the symbolic. Lacan's immersion in the structuralist linguistics of Ferdinand de Saussure and anthropology of Claude Lévi-Strauss helps him to reveal the alternative to the imaginary. Whereas the imaginary offers the exclusive either/or of obsessive identity through representation or aggressive destruction of the object of identity, the symbolic partially satisfies both impulses.

The symbolic is able to have such success based upon the structure of the sign. If, for Saussure, the sign combines a material element (the signifier) and the 'idea' which it indicates (the signified), then Lacan sees this structure as representing precisely the split condition of all human representation. That is, because the sign can only make present a signified through the mediation of a signifier, there is an absence in every presence; the idea can only be present through what represents it but is not it. Moreover, to speak a language is implicitly to accept this limitation. It is to partially master absence - the absent signified is always to some extent present - but at the price of the implicit admission that there can be no transparent presence. Language is a representation, then, that always represents the necessity of alienation (in the 'bar' dividing signifier and signified) along with a specific object or state of affairs. Lacan's reinterpretation of the Freudian Oedipal and castration dramas as the acceptance of this prohibition implicit in language (for example, the 'Name-of-the-Father' for the father) allows him to divide off the Freudian developmental schema from any culturally specific view of the family.

To address the symbolic more concretely demands one more observation. If the bar between signifier and signified

represents to the subject its own ‘gap’ or ‘want-to-be’ (‘*manque-à-être*)’, then it does so in a movement, the process that Lacan identifies with ‘desire’. Within desire, language concretely demonstrates the impossibility of complete, unmediated presence. It does so by producing an ongoing process of ‘identifications’ mediated by language and always presenting themselves, therefore, as inadequate. Desire involves an ongoing movement which destroys identity (the ego) in favour of a metonymic ‘sliding’ from one signifier to another - but always by producing a new identity in the place of the old one.

It is this sliding that Lacan valorizes over and against the obsessive identification or aggressive demolition allowed by the imaginary. Lacan thus finds the efficacy of psychoanalysis in its ability to release desire from the limitations of the imaginary. It is possible to see how far a Freudianism based upon such an ‘ethics’ of pure desire, departs from almost all psychoanalytic orthodoxy. For most Freudians the purpose of analysis is at least partly to strengthen the ego. For Lacan the purpose of analysis is to allow the subject’s desire to overcome the imaginary grip of the ego - to make identity fluid (see Alterity and identity, postmodern theories of §2; Subject, postmodern critique of the).

In the 1960s and 1970s, Lacan’s work concentrates on Freud’s least accepted thesis. As Boothby (1991) shows, Lacan takes the Freudian hypothesis of a ‘death drive’, strips it of its biological trappings and then places it at the centre of psychoanalysis: what the dynamism of symbolic desire sustains within the subject’s world is precisely the release of those energies which, within the imaginary, could only gain expression through aggression - energies that necessarily evade the stasis of imaginary representation. The symbolic sublimates these energies, the energies of the death drive, by putting them to work in the process by which language erodes identity. With these ideas, Lacan devotes his latest work to what he calls the ‘impossible real’, to that which is forbidden entry into representation.

Lachelier, Jules (1832-1918)

Lachelier is, along with Octave Hamelin, one of the foremost French metaphysicians of the nineteenth century. An idealist, he was a major figure in the neo-spiritualist movement, which opposed the materialism dominating scientific thought at the time. For all that, Lachelier did not set up a division between consciousness and life, but, following the example of Maine de Biran and Ravaisson, he rather saw in mind the inwardness of life, at work in the whole of nature.

As a student, Lachelier graduated top in the *agrégation* in philosophy, and in 1871 he defended his doctoral theses, 'Du fondement de l'induction' ('On the Basis of Induction') (1871) and 'De natura syllogismi' ('On the Nature of the Syllogism'). In the former, he showed that the real inductive process assumes not only the principle of causality but also a principle of persistence for essences, which are perceived through the individual, and which orientate themselves in relation to one another in a hierarchy. 'Harmony is in some way the supreme interest of nature' ([1902] 1871: 70). Nature cannot be completely external to thought, since then it would be as if it did not exist for us. It is therefore necessary to find some way of both 'making thought real, and making nature intelligible' ([1902] 1871: 74).

The article 'Psychologie et métaphysique' ('Psychology and Metaphysics') (1885) is perhaps Lachelier's greatest work, in which he goes far beyond the dogmatism of Victor Cousin. He begins by remarking that to be extended and to perceive extension are two distinct things, and neither of them is sufficient to define a consciousness. Extension appears to be outside us, but this externality is our work. Extension cannot exist in itself, because its parts, which are infinitely divisible, would be without continuity if separated from thought. Extension is 'a whole, whose parts divide but do not constitute it' (1902 [1885]: 188). Its continuity comes to it from the mind, and the perception of depth, for example, is nothing more than 'a spontaneous product of our thought'; it represents a beyond.

Consciousness is therefore primary. Further, instead of saying with the materialists that it progresses from perception to will, the contrary is true, in that it descends from will to perception. In sensation, there is always something affective. Sensibility senses itself; at the same time, it feels some quality. Thus, the subject is given to itself, and distinguishes itself from the external world.

However, we cannot say that our affections are ourselves. We ourselves *make* our feelings through our own love or hatred. The awareness of each feeling includes the operation of some tendency and ultimately the will to live. And 'if we do not feel our will, this is not because it is nothing, but because it is ourselves' (1902 [1885]: 194). Will is the principle and the hidden source of everything. Man is the only being which fixes qualities in extension and composes 'this permanent mirage which he calls the external world' (1902 [1885]: 195). But the pure will - which is closer to that envisaged by Schopenhauer than Maine de Biran (§3) - goes beyond individual existence. The self is the will refracted in the affective state whose form expresses one's character. It is found only to be lost.

From psychological analysis, Lachelier moves towards synthesis, where the primary place is given to the idea of truth. Even at the level of physical pain, it is necessary to say that 'consciousness of pain is not painful, but true' ([1902] 1885: 201). This is an elegant idea, with a hint of stoicism, for which Lachelier has often been criticized, since if the feeling of pain is not painful, how can it be true, that is to say, conform to its object? Moreover, it is above all the property of pain to be essentially present, so that no memory or idea can affect it; it is an existential shock that one also finds at the height of physical joy. But Lachelier wants to say that psychological consciousness is based on an *intellectual* consciousness, which gives it the seal of objectivity. Therefore consciousness resides in the final analysis in the truth of being, and the idea of being, being itself of being, can construct itself, from the sphere of logical necessity right up to that of living things.

The final word is given to a dialectic of liberty, through which the being that supports us produces itself. The subject is not an act, but a form, and Lachelier eloquently puts away 'any idea of a special and mysterious subject, the transcendent I in the sensible consciousness. Such a subject would in fact be only one more object', 'To know something one must in some manner *be* that very thing, and to accomplish this one must not in the first instance be other than oneself' ([1902] 1885: 206). Besides, if by some supernatural act the self of another person was put in

place of one's own, it would be absolutely impossible for us to see this. In short, individuality is based on the simple connection of memories. On the other hand, the 'light of thought' is infinitely greater than the individual self and escapes its grasp, because it is of the order of having to be rather than being. The progress of thought ends when, after seeking for itself in necessity as in its shadow, then in the will as in its body, it finally finds itself in freedom. There is not a fourth idea of being, because there is no fourth dimension of extension.

Lacoue-Labarthe, Philippe (1940-)

Philippe Lacoue-Labarthe is Professor of Philosophy at the universities of Strasbourg and Berkeley. At the centre of his thought is philosophy's ostracism of literature, which in his view characterizes the foundational scene of philosophy itself. Lacoue-Labarthe demonstrates how all Western thought, including Heidegger (perhaps its most faithful deconstructor) lies within a conception of mimesis which is still metaphysical in that it remains bound to the opposition between truth and mimesis: an 'imitation' alters (or falsifies) its original, thus contrasting with that which is 'true'. The non-metaphysical thought of mimesis proposed by Lacoue-Labarthe, by contrast, shows how a mimetic aspect structures the concept of truth itself, making it impossible to distinguish between truth and verisimilitude, model and copy. Thus a new area of investigation is laid open concerning fictional modes of thought: the manner in which myths and figures are produced.

Lacoue-Labarthe's thought is largely a rereading of the history of philosophy, from the Greeks to the present day. In Plato's *Republic*, the affirmation of philosophy's superiority runs parallel to a devaluing of literature (*mythopoïesis*, telling of myths). Mythopoetical activity is devalued because *mimēsis* (see Mimēsis), imitation, pertains, not to truth, but to verisimilitude (myths are fiction, falsifications of the original). Such activity, Lacoue-Labarthe argues, necessitates a passive, and so unfree, attitude on the part of the subject.

A similar bias against literature characterizes the whole Western tradition, at least up to what Lacoue-Labarthe calls the 'Romantic moment', which continues down to the present. With early German Romanticism, literature (poetry, in particular) starts to be re-evaluated as a place of truth. Traces of this re-evaluation can be found in Hölderlin, Heidegger and Celan (see Hölderlin, J.C.F.; Romanticism, German). Lacoue-Labarthe's own thought is situated, in a rather peculiar way, inside this 'anti-Platonic' tradition: hence his interest in early German Romanticism (*L'Absolu littéraire*, 1978, with Jean-Luc Nancy), idealism, Nietzsche and Heidegger.

In this, Lacoue-Labarthe attributes a particularly important role to Heidegger, whose thought constitutes the most extreme and complete attempt at deconstruction of the metaphysical tradition. Such thought was also responsible, however, for Heidegger's calamitous association with National Socialism in 1933. Many of Lacoue-Labarthe's works seek to explain this unsettling combination of totally different aspects in Heidegger's thought.

First, in the key work *Typographie* (1975) (*Typography*, 1989), Lacoue-Labarthe demonstrates how in Heidegger a Platonic conception of *mimēsis* - thus truth - still persists and is to a large extent undisputed. Truth is, in fact, conceived as a static determination of Being, the erection of a 'pedestal', or 'stele' (translation of *Ge-stell*, a key term in Heidegger's later works). For this reason Lacoue-Labarthe proposes setting the term *onto-theo-logy* (used by Heidegger to indicate Western metaphysics) side by side with the term *onto-typo-logy*, which would characterize the tradition of Western metaphysics *and*, at least partially, Heidegger's own thought. The concept of *onto-typo-logy* restates Heidegger's 'ontological difference' in light of the question about *mimēsis*: Being is considered in the fixed quality of a *typos* (type, seal, stamp) from which beings originate as traces or imprints which resemble the *typos* itself. This means that Heidegger thinks, as is the case in the Platonic model, that the mimetic relationship between Being and beings corrupts the truth of Being.

Second, in *La Fiction du politique* (1988) (*Heidegger, Art and Politics: The Fiction of the Political*, 1989), *L'Imitation des modernes* (1986a) as well as, in other, new ways, L*a Poésie comme expérience* (1986b, dedicated to Paul Celan), and *Musica ficta (figures de Wagner)* (1991) (*Musica Ficta: Figures of Wagner*, 1995), Lacoue-Labarthe demonstrates how the figural immutability characterizing thought in general is again found, with notable force, in Heidegger's reflection on art after 1933, in which the work of art is thought of above all as shape and support (*Gestalt* and *Ge-stell*) of truth. This way of thinking reveals, according to Lacoue-Labarthe, the 'mythical' nature of National Socialism. For, as he argues in 'The Nazi Myth' (1989, with Jean-Luc Nancy), Nazi ideology repeats the constitutive traits of the mythic process. By means of the creation of great ideal figures (leader as figure *par excellence*), it attempts to respond to the demand for identity on the part of the German people: the community identifies itself with the figure and fashions itself as would a work of art. In reality, National Socialism is, for Lacoue-Labarthe, a National *Aestheticism*. Entirely apart from his adhesion to the Nazi Party in 1933, then, Heidegger's thought would appear to demonstrate both a pronounced proximity *and* a total distancing from National Socialism.

Lacoue-Labarthe's complex relationship with Heidegger places him in a position within post-Romantic and anti-Platonic thought which is unique in three ways. First, he opens a new conception of *mimēsis*, according to which it does not corrupt truth but rather is co-originating. The two conceptions of truth pointed out by Heidegger are articulated together: *aletheia*, truth as 'revealing', always tends towards *adaequatio*, truth as adequation, but each time finds itself only to be inadequate to itself. Second, he presents a new image of the subject. In essays such as 'L'Écho du sujet' (in *Le Sujet de la Philosophie*, 1979) and 'Le Titre de la lettre' (1973, with Jean-Luc Nancy), Lacoue-Labarthe confronts psychoanalysis, which itself is based on a mimetological mythography (for example, Oedipus). Against the speculative dream of a subject capable of theorizing about its own conception, Lacoue-Labarthe sets up an image of a subject which is constitutively incomplete. The truth of the subject is captured by its verisimilitude: by the inexhaustible tension of resembling itself, which must always surrender and fail. The subject can therefore never become a figure, because every figure of the origin of the subject falls back to an engendering of the figure itself. This deconstruction of the concepts of origin and dichotomous conceptuality draws Lacoue-Labarthe's thought close to that of Jacques Derrida. Third, he produces an esthetic and ethical-political position which is unique, though in certain aspects close to that of Maurice Blanchot. In Lacoue-Labarthe's view, the incompleteness of the subject tends towards a state of impotence which must not be thought of as passivity. It is rather more a *désistance*, a stoic, active existence/resistance. The human being, by actively protecting its own passivity and the lack of a figure capable of identifying it, can thus oppose itself to any form of totalization and totalitarianism.

Lakatos, Imre (1922-74)

Imre Lakatos made important contributions to the philosophy of mathematics and of science. His 'Proofs and Refutations' *(1963-4) develops a novel account of mathematical discovery. It shows that counterexamples ('refutations') play an important role in mathematics as well as in science and argues that both proofs and theorems are gradually improved by searching for counterexamples and by systematic 'proof analysis'. His 'methodology of scientific research programmes' (which he presented as a 'synthesis' of the accounts of science given by Popper and by Kuhn) is based on the idea that science is best analysed, not in terms of single theories, but in terms of broader units called research programmes. Such programmes issue in particular theories, but in a way again governed by clear-cut heuristic principles. Lakatos claimed that his account supplies the sharp criteria of 'progress' and 'degeneration' missing from Kuhn's account, and hence captures the 'rationality' of scientific development. Lakatos also articulated a 'meta-methodology' for appraising rival methodologies of science in terms of the 'rational reconstructions' of history they provide.*

1 Life

Imre Lakatos was born Imre Lipschitz in Hungary in 1922. His early life was turbulent even by the remarkable standards of the time. He was a member of the resistance during the Second World War, fortunately evading arrest (unlike his mother and grandmother, both of whom were murdered in Auschwitz). After the war he pursued a political career and by 1947 had become a powerful figure within the Hungarian Ministry of Education; in 1950, however, he was arrested and spent over three years in a Stalinist jail. Informed of the likelihood of rearrest, he fled in 1956 to Vienna, and eventually to Cambridge, where he studied for a (second) doctorate under the supervision of R.B. Braithwaite.

In the course of these studies, he became a regular attender of Karl Popper's seminar at the London School of Economics, and Popper's thought and approach had a major influence on him. Lakatos was appointed to a Lectureship at the LSE in 1960, and spent the rest of his life there, being awarded a personal chair in 1970. For unrevealed reasons, the British Home Office rebuffed two impressively supported attempts to obtain British citizenship and Lakatos remained officially 'stateless'. He died suddenly, from a heart attack, in February 1974. He had a vivid personality, strong political views and a sharp wit: he inspired intense loyalty and opposition in roughly equal measures.

2 'Proofs and Refutations': contributions to philosophy of mathematics

Lakatos published some philosophical articles (mostly book reviews) before coming to the West, and some commentators discern the influence of his Marxist and Hegelian education throughout his career, but his significant contributions to philosophy were all made after arriving in the West. His doctoral studies at Cambridge eventually formed the basis for his 'Proofs and Refutations' (originally published as a series of four journal articles in 1963-4, and in book form with further material only posthumously in 1976). Perhaps his major work, it consists of an imaginary discussion between a teacher and a group of his (frighteningly bright) students. The first part reconstructs the history of the attempts to prove the Descartes-Euler conjecture about polyhedra (that the number of vertices minus the number of edges plus the number of faces is equal to two for any polyhedron). The real history is told in the many footnotes. A second part of the discussion reconstructs the discovery of uniform convergence as the result of the 'refutation' of one of Cauchy's results. Aside from its philosophical and historical interest, the dialogue is a literary *tour de force*.

Lakatos argued that the standard picture of the development of mathematics is seriously faulty. On that picture, either an assertion is conjectured to hold and after a time a proof of it is produced, or mathematicians simply set out to 'prove' from some agreed axiomatic basis, recording as a 'theorem' any result which they hit upon that happens to interest them. Lakatos suggested that in fact theorems are invariably conjectured ahead of proof, and the proof process is a protracted affair in which initial attempts are criticized and gradually improved, along with the 'theorem' itself. At first this is trial-and-error, involving searches for counterexamples both to the original 'theorem' and to the 'hidden assumptions' that are articulated in the course of initial attempted proofs.

This trial-and-error phase of conjecture followed by undirected search for proof and/or counterexample is

eventually superseded, however, by a more systematic phase - that of ‘proof analysis’. Lakatos - inspired by his countryman Polya - argued that the process of mathematical discovery is not a ‘merely’ psychological affair to be studied by trying to delve into the minds of the great mathematicians, but can be shown instead to be governed by articulable heuristic principles. Hans Reichenbach, Popper and the Logical Positivists all saw an unbridgeable divide between - in Reichenbach’s terminology - the ‘context of justification’ and the ‘context of discovery’; and all asserted that philosophy or logic of science is concerned only with the former ‘context’. Questions of discovery were alleged neither to call for logical analysis nor to be susceptible of it. Lakatos argued that, in the case of mathematics at least, this view is importantly mistaken, and that there is a realm of logically analysable, mathematical heuristic outside the two traditional ‘contexts’. This claim forms an important link with Lakatos’ later contributions to the philosophy of science (see Discovery, logic of §2).

One of the intriguing (but often frustrating) aspects of ‘Proofs and Refutations’ is that its dialogue form, although used to brilliant effect, sometimes makes it difficult to discern what thesis is actually being propounded: not even ‘Teacher’ is always right. This has resulted in some obscurity about the underlying view of the nature of mathematical knowledge. Lakatos himself believed that his message was fundamentally Popperian - that he was extending Popper’s fallibilism into the area of mathematics. Another view - indicated in the book’s editorial footnotes - is that Lakatos simply described (in fascinating detail) the fallible *process* by which essentially infallible, logically true, knowledge is created in mathematics. These editorial footnotes have themselves been attacked as a ‘betrayal’ of the real ‘anti-formalist’ message of the book (Davis and Hersch 1981).

3 The ‘methodology of scientific research programmes’: contributions to philosophy of science

After ‘Proofs and Refutations’, Lakatos turned his attention to the philosophy of science. Although his 1968 paper ‘Changes in the Problem of Inductive Logic’ defends a broadly Popperian line against Carnapian ‘inductive logic’, Lakatos soon came to see major defects in the Popperian approach. ‘Popper on Demarcation and Induction’ (1974) contains a detailed criticism of Popper’s claim to have solved Hume’s problem. Popperian corroboration appraisals are simply summaries of how the available theories have stood up to testing *so far*. Those appraisals, therefore, can have no consequences for the comparative future reliabilities of the various theories, nor for the reasonableness of relying on one theory rather than a rival in future applications, unless some assumption is made that - in Popperian terms - links corroboration appraisals to claims about overall ‘verisimilitude’. Such an assumption amounts to a reformulation in Popperian terms of a uniformity-of-nature assumption, linking past test results to an overall judgment of the theory’s truth-likeness and hence its reliability in past *and* future tests. That (merely posited) principle has, therefore, seemed to most commentators much stronger than a mere ‘whiff’ of induction, as Lakatos represented it.

Although argued in a new way, Lakatos’ point here is similar to arguments against Popper already produced by Reichenbach, Ayer, Salmon and others. Lakatos’ views on ‘demarcation’ were altogether more innovative. Thomas Kuhn had pointed out (1962 and elsewhere) that many aspects of the development of science seem at direct odds with Popper’s falsificationist account. For example, the typical response of a theoretician to an experimental ‘refutation’ of his favoured theory is not, as Popper seemed to suggest, to reject that theory and look for an alternative, but instead to treat the experimental result as an ‘anomaly’ which could and should be accommodated within the theory. Lakatos saw his ‘methodology of scientific research programmes’ (further developed and defended in his 1970 paper) as a synthesis of the views of Popper and of Kuhn. He agreed with Kuhn that the correct unit of analysis in science is much broader than that of a single theory. A Lakatosian research programme is characterized by a ‘negative heuristic’ principle specifying its ‘hard core’ (the set of basic propositions that will be implied by every theory that issues from it), and by a ‘positive heuristic’ (a set of directives, possibly deriving from some broad metaphysical principle, governing the construction of specific theories within the programme, and governing their modification in the light of experimental difficulties that may arise). Specific theories produced by a programme *are* experimentally refutable (or would be if fully articulated), but the standard response to an actual refutation will be to look for a further specific theory within the same programme. Since this successor theory will also entail the same central (‘hard core’) claims, this process will seem like ‘holding onto’ a theory by ‘modifying’ it in the light of experimental difficulties, rather than rejecting it.

This sounds like Kuhn’s idea of ‘articulating the paradigm’ and treating experimental difficulties as ‘anomalies’. According to Lakatos, the main problem with Kuhn’s account is that it seems not to be able to explain scientific

change as a rational process. What distinguishes a proper, scientific further articulation of a paradigm or programme from a defensive nonscientific one? If it was good scientific practice for Newtonians to defend their basic ‘paradigm’ or ‘hard core’ against their failure to explain Uranus’s orbit by postulating a hitherto unknown planet, was it not equally good scientific practice for phlogistonists to defend their theory - that combustion always involves release of phlogiston - against the fact that burning mercury in air produces a heavier ‘ash’ by postulating negative weight for phlogiston (or by postulating that burning mercury involves both the release and the absorption of material)? A second, related problem is that the distinction between real science and pseudoscience seems to be endangered by Kuhn’s account. Kuhn seems committed to the view that there are no articulable ‘logical’ rules of good science or of correct response to evidence. Priestley was not ‘wrong or unscientific’ to hold on to the phlogiston theory, he was simply outvoted.

Lakatos argued that there is in fact a clear-cut distinction here - one based on the old idea of independent evidence, but given a new slant. The difference between, for example, the Newtonian shift and that involved in defending phlogistonism is the difference between a ‘progressive’ and a ‘degenerating problem shift’. The postulation of a further planet to explain the anomalous motion of Uranus within Newtonian theory not only solved the problem of Uranus’s motion but also led to further independently testable predictions - the new planet could after all be observed. On the other hand, the shift in phlogistonist assumptions simply *at best* resolved the known anomaly, while making no further testable predictions.

Lakatos was always interested in the relationship between the philosophy of science (and mathematics) and its history and felt that philosophy of science in the post-war period had suffered from its paying too little attention to actual scientific practice. In his 1971 paper ‘History of Science and its Rational Reconstructions’, he proposed a general method for the evaluation of rival philosophies or methodologies of science in terms of the ‘rational reconstructions’ they provide of the history of science and especially of historical episodes of major changes in accepted theories. His basic idea was that there is a range of historical cases in which, speaking intuitively, the ‘scientifically correct’ decisions were clearly made (for example, the acceptance of Newtonian theory or of Maxwell’s theory). A methodology should endorse (and so give a general explanation of) these cases; and should, in cases where it implies that the ‘wrong’ decision was made, be able to point to independent evidence for the operation of ‘external factors’ (political or religious interference, for example). He argued that his own methodology did better on these terms than other accounts, such as inductivism, conventionalism or Popperian falsificationism.

Lambda calculus

The lambda calculus presents a delimited formal setting for expressing and studying properties of mathematical operations and computer programs. Its syntactical unit is the term. Application terms tu represent supplying argument u to routine t. Abstraction terms $\lambda x.t$ *(in which* λx *binds x in t) represent the explicit definition of an operation from a routine t. Term computation is by reduction: (* $\lambda x.t$*)(u) reduces to t[x/u], the result of substituting u for x in t; this corresponds to operating with t on u. Terms are equal either when they differ only in bound variables or when one converts to the other via a finite chain of reductions and counter-reductions. There are two main varieties of lambda calculi: typed and untyped (or type-free). Any untyped term is applicable to any other and equality between such terms is undecidable. In the typed case, terms are indexed by types and application is permitted only when types conform. Here, equality is decidable. A. Church proposed formalisms for both varieties during the 1930s. He and his students S. Kleene and J. Rosser proved the early syntactical metatheorems linking the untyped calculus with computability theory. In 1969, D. Scott gave the first set-theoretic construction of a functional model of the untyped calculus; since then, many other models have been devised. As for the typed calculus, Gödel's* Dialectica *interpretation inspired many of its applications to proof theory. Also, the idea, due to H. Curry and W. Howard, of using logical formulas as types reveals a close correspondence between typed terms and derivations in intuitionistic formal systems. In the last decades of the twentieth century, the lambda calculus and its models have been put to many uses in computer science, with functional programming and denotational semantics deserving special mention.*

1 Abstraction, application and currying

Gottlob Frege's doctrine of concepts and objects (1893) put abstract mathematical functions, including higher-order functions taking functions as inputs or yielding functions as outputs, at the centre of logic (see Frege, G. §3). He insisted that adequate notation for functions must distinguish them from their values. For example, the expression $x^2 + 3x + 7$, for x a natural number, is ambiguous, denoting both the value of the expression at fixed input x and the function that yields $n^2 + 3n + 7$ for every value n of x. Frege realized that, to disambiguate, it suffices to bind x with a prefix operator, such as λx, to yield

$$\lambda x.x^2 + 3x + 7.(1)$$

(Frege's own notation did not employ λ but the Greek symbol for smooth breathing.) These expressions, conveniently displaying both independent variable and a recipe for computation, Frege took to denote functions (in *extension*). Such terms as (1), now called 'abstraction terms', reflect a Fregean notion of function as grasped by abstraction from its values: $0^2 + 3\cdot 0 + 7$, $1^2 + 3\cdot 1 + 7$ and so on. Those values are retrievable from (1) by application: the term

$$(\lambda x.x^2 + 3x + 7)(0)$$

denotes the value of the function on the input 0, which we compute by dropping λx and substituting 0 for x in $x^2 + 3x + 7$ to obtain $0^2 + 3\cdot 0 + 7 = 7$.

In effect, Frege also recognized that lambda notation renders binary or multiary functions as combinations of unary ones, a conversion known as 'currying' after the logician H. Curry. For instance, a lambda term for addition, $\lambda x\, \lambda y.x + y$, denotes a function taking its arguments one at a time: first x and then y. Its evaluation at 2 yields a unary function

$$(\lambda x\, \lambda y.x + y)(2) = \lambda y.2 + y,$$

which can be evaluated at 3:

$$(\lambda y.2 + y)(3) = 2 + 3 = 5$$

to yield the desired result.

Alonzo Church was the first to devise formal systems, which he called 'calculi of lambda-conversion' (1941), devoted primarily to codifying such properties of functions. He introduced lambda notation as a variant of the caret (ˆ) employed in Whitehead and Russell's *Principia Mathematica* (1910-13) as abstraction operator. Church

intended his calculi to capture an operational conception of function distinct from the extensional notion enshrined in set theory. Set theory conceives of functions as collections of ordered pairs with domain and range so delimited that application of arbitrary function to arbitrary input is prohibited. Hence, set theory does some injustice to operations which apply universally, such as identity, which maps anything to itself, or that operation taking each entity a to the constantly a-valued function. By Church's lights, expressions of the lambda calculus were to denote operations or 'functions in intension': mathematical rules, routines or programs for computing outputs from inputs which may apply universally, even applying to themselves.

2 A formal calculus of terms

There are two general varieties of lambda calculi: 'typed' and 'untyped' (or 'type-free'), both devised by Church. In either case, the basic syntactic category is that of the 'term' (or λ-term). Atomic terms are either variables or constants. Compound terms are of two kinds. There are 'application' terms: if t and u are both terms, so is tu, denoting the input of u to routine t. And, for explicit functions, there are 'λ-abstractions': if t is a term, so is $\lambda x.t$, where x is a variable and λ binds all occurrences of x. In typed systems, each term is also assigned a type and applications *tu* are well-formed only if the types of t and of u are suitable. (Further discussion of typed systems is postponed to §6). The untyped lambda calculus suffers no such restriction: self-applications such as xx and $(\lambda x.xx)(\lambda x.xx)$ are permitted. Sample untyped terms include $\lambda x.x,\ \lambda x.a,\ \lambda x\,\lambda y.x,\ \lambda y.y$. The first gives the identity function, the second (with a constant) the constant a-valued function and the third the first projection function, mapping each item a to the constantly a-valued function $\lambda y.a$. The last yields the same function as the first: terms differing only in bound variables, known as 'α-congruent terms', are identified.

Closed abstraction terms without constants are called 'combinators'. Conventionally, combinators $\lambda x.x,\ \lambda x\,\lambda y.x$ and $\lambda x\,\lambda y\,\lambda z.xz(yz)$ are abbreviated $I,\ K$ and S, respectively, where I stands for 'identity', K for the *Konstanzfunktion* yielding constant functions, and S for a general composition function or *Verschmelzungsfunktion*. This nomenclature derives from M. Schönfinkel's combinatory logic and signals that these lambda terms perform the same operations as their combinatory namesakes (see Combinatory logic §1).

3 Computations, reductions and normal terms

It is in no way inaccurate to see lambda calculi as rudimentary programming languages, with terms representing computing recipes and their values. As a programming language, unrestricted application in the untyped lambda calculus realizes von Neumann's idea that programs serve also as data (see Neumann, J. von). There is a notion of lambda calculus computation, which may, like real-life computation, lead to non-terminating 'infinite loops'. As will be apparent (see below) the lambda calculus programming language is rich enough to express all possible algorithms on the natural numbers and is illuminated by respectable concepts of program meaning or denotation.

The notion of 'reduction' (properly, β-reduction) is the principal analogue within the lambda calculus of finitary computation. It affords an analysis of a process of stepwise evaluation obeying a series of atomic, rule-governed steps. Every such step takes its start from the idea of abstraction term exploited above: $\lambda x.t$ names the recipe which begins computation when λx is removed and a name for an input is substituted where x appears free in t. In the lambda calculus, every atomic reduction step begins with a 'redex', an application term of the form $(\lambda x.t)u$ - setting us the project of evaluating recipe $\lambda x.t$ at input u. One replaces the redex with its 'contractum', term $t[x/u]$, the result of substituting u for all free occurrences of x in t (with bound variable changes to avoid clashes). 'Computing' in the lambda calculus is iterated reduction: term v reduces to w if w results from v via a finite number of one-step reductions or replacements of contractum for redex.

Terms are equal when they are interconvertible via computation. If u is derivable from t via a finite sequence of reductions and counter-reductions (perhaps with changes in bound variables) t β-equals (or β-converts to) u; symbolically, $t = u$. A lambda theory T is a set of formal equations between terms that extends β-equality: whenever t β-equals u, then $t = u$ belongs to T. Intuitively, correct reductions preserve the meanings of the terms involved; hence, β-equal terms share the same meaning. Lambda theories, as sets of equations, respect those meanings. (Lambda models make rigorous sense of these intuitions about meaning. See §5.)

A series of reductions terminates when no further reduction is possible. Irreducible terms are said to be in 'normal form'. It follows that any variable or constant is in normal form, as is any term $\lambda x.t$ in which t itself is normal.

But, just as some computer programs loop infinitely, some untyped terms never reduce to a normal form: $(\lambda x.xxy)(\lambda x.xxy)$ reduces to $((\lambda x.xxy)(\lambda x.xxy))y$ and further reductions always reproduce the original redex. Though some untyped terms lack a normal form, when a term does so reduce, its normal form is unique, at least up to bound variables. This is a corollary of the crucial ‘Church-Rosser theorem’, which states that, if t reduces to u and to v, then there is a term w to which u and v both reduce.

Notions of equality alternative to β-equality are studied, among them $\beta\eta$-equality. This relation respects the ‘ η-rule’: that $\lambda x.tx$ reduces to t when t does not contain x free.

4 Arithmetic and undecidability

Church and his students S. Kleene and J. Rosser showed, in effect, that, as a programming system, the untyped lambda calculus is comprehensive in that one can define any computable function within it, once natural numbers are represented. Let 0 be $\lambda x\,\lambda y.y$, 1 be $\lambda x\,\lambda y.xy$, 2 be $\lambda x\,\lambda y.x(xy)$, 3 be $\lambda x\,\lambda yx(x(xy))$, and so on. These ‘Church numerals’ possess the attractive property, exemplified by 3, that $3ab$ reduces to $a(a(ab))$. Also, all Church numerals are in normal form. Let $[[n]]$ stand for the Church numeral of n. A natural number function f, which may be partial, is λ-defined by t just in case, whenever $f(n)$ exists, $t[[n]]$ reduces to $[[f(n)]]$, and, if $f(n)$ is undefined, then $t[[n]]$ does not reduce to a normal form. A function is λ-definable when it has a λ-defining term.

During 1933, Church speculated that the λ-definable functions coincide with the algorithmically computable functions. This speculation came to be known as ‘Church’s thesis’. If Church’s thesis is true, then every possible recipe for computing with the integers is λ-defined by a term in the untyped lambda calculus and every computation with that recipe appears as a reduction sequence involving that term. Church and Kleene were able to confirm Church’s thesis by proving that every function which is Gödel-Herbrand general recursive is λ-definable. One proof of this requires the construction of fixed-point combinators: terms which, given t, yield u such that tu β-equals u. Y, the ‘paradoxical combinator’ discovered by Curry,

$$\lambda x.(\lambda y.x(yy))(\lambda y.x(yy))$$

is one such; applied to any t, Yt β-equals $t(Yt)$.

As befits a programming system, the untyped lambda calculus exhibits undecidability. In 1936, Church used the calculus to prove the undecidability of first-order logic, resolving Hilbert’s *Entscheidungsproblem* (‘decision problem’; see Hilbert’s programme and formalism). A general undecidability theorem for the lambda calculus, first proved by D. Scott in 1963 and rediscovered by Curry in 1969, can be stated in terms of recursive separability. Two sets of terms are ‘recursively separable’ if there is a decidable set containing one and disjoint from the other. The ‘Scott-Curry theorem’ asserts that no two non-empty sets of terms closed under β-equality are recursively separable. A corollary is that untyped β-equality and normalizability are both undecidable.

5 Models

Until the late 1960s, syntactic study dominated research on the untyped lambda calculus. Term models were constructed but their elements were syntactic: equivalence classes of terms under such relations as β-equality. An obstacle to building models in set theory, models which capture Church’s vision of a calculus of functions, was self-application. In standard set theory, self-application of functions is not permitted, since no set-theoretic function lies in its own domain.

In 1969, Scott constructed D_∞, the first recognizably functional model for the untyped case. Scott realized that terms can be interpreted successfully as continuous (rather than arbitrary) functions on complete partial orders. Here, a complete partial order is a partially ordered set with a least element and with least upper bounds for all directed subsets. A continuous function is one whose output values are determinable by finite approximations. D_∞ is a complete partial order enabling self-application, since it is isomorphic to the space of continuous functions from D_∞ into itself. Each element of D_∞ then plays two roles: as element of the model and as function on the model’s domain.

Other models, some simpler in design, were soon forthcoming. G. Plotkin, in 1972, discovered the fundamental idea behind (what is now called) the graph model $P\omega$. The elements of $P\omega$ are subsets of the natural numbers.

$P\omega$ is not isomorphic to its space of continuous functions but, since that space is embedded within $P\omega$, it interprets self-application. A general notion of lambda model, due to A. Meyer (1982) and Scott (1976), which both D_∞ and $P\omega$ exemplify, is tripartite, comprising non-empty domain D, binary application $\circ$ on D and a unary operation Λ. $\circ$ creates on D a model of combinatory logic while Λ serves as a 'functionalizer' mapping each d in D to the function taking a into $d \circ a$ (see Combinatory logic §2). Soundness and completeness theorems confirm the adequacy of this general notion: every lambda model satisfies all basic principles of β-equality and every lambda theory has a lambda model. Intuitively, then, the meanings preserved by reductions are respected in every lambda model.

6 Typed lambda calculi

In the typed lambda calculus, inputs to a function given by a term, as well as its outputs, are restricted to a particular domain or type. For example, to say that term t has type $A \Rightarrow B$ will mean that its inputs are restricted to members of type A and its outputs to B. Hence, if $\mathbb{N}$ is the domain of natural numbers, the successor function on $\mathbb{N}$ is of type $\mathbb{N} \Rightarrow \mathbb{N}$. Typing renders formal two informal ideas. The first is the notion that every well-defined mathematical function bears a specific domain of inputs and range of outputs. The second is that underlying programming languages in which allowable inputs to a program are restricted to members of a particular type, say, natural numbers or integers. With respect to decidability, typing lambda terms makes for notable differences.

Types are defined inductively: there are atomic types and, whenever α and β are types, so is $\alpha \Rightarrow \beta$. One may interpret atomic types to include the natural numbers or the truth-values and compound types $\alpha \Rightarrow \beta$ as containing functions from type α to type β. Types are then used to index terms. Variables and constants, if any, are assumed typed. Application terms must accord with typing: if t is of type $\alpha \Rightarrow \beta$ and u is of type α, then (tu) is of type β. For abstraction terms, when x is of type α and t of type β, $\lambda x.t$ is of type $\alpha \Rightarrow \beta$.

It is straightforward to define natural concepts of reduction, equality and normality for typed terms. There are no self-applications or paradoxical combinators in typed systems. As A. Turing first proved, every typed term reduces to a normal form. Typed reduction also satisfies a Church-Rosser theorem. In fact, a strong normalization theorem obtains: given a typed term, every legitimate way of reducing it eventually ends in the same normal term. It follows that, in contrast with the untyped calculus, typed equality is decidable. Suitable Church numerals are constructible; the natural number functions definable by typed terms are, as discerned independently by H. Schwichtenberg and R. Statman, precisely the extended polynomials. These include integer polynomials such as $\lambda n.3n^2 + 6n + 4$, and functions defined from them using definitions by polynomial cases, for example, $3n^2 + 6n + 4$ if $n = 3$ and n^4 otherwise.

Proof-theoretic applications of typed lambda calculi are prominent. The calculus is extendible to a formalism T for describing the constructive functionals Gödel used in his *Dialectica* interpretation and proof of arithmetic's consistency (see Intuitionism §6). Terms in T admit a natural reduction relation which is Church-Rosser and terms are strongly normalizable.

In the typed calculus, if A, B and C are types, then compound types such as $A \Rightarrow (B \Rightarrow A)$ and

$$[A \Rightarrow (B \Rightarrow C)] \Rightarrow [(A \Rightarrow B) \Rightarrow (A \Rightarrow C)]$$

resemble formulas in implicational logic. Curry and R. Feys (1958) noted that these formulas, which are intuitionistically valid, are types suitable for the combinators K and S, respectively. Indeed, the correspondence is general: typed terms accord precisely with correct derivations in the implicational part of intuitionistic propositional logic with application mirroring *modus ponens* and abstraction conditional proof. Moreover, reductive simplifications in logical derivations coincide with reductions in the lambda calculus. This correlation of terms with proofs, known as the 'Curry-Howard isomorphism' or 'formulas as types', was successfully extended to first-order logic by W. Howard (1980) and to second-order logic by J.-Y. Girard.

7 Computers and the lambda calculus

Research on the lambda calculus is now closely allied with machine computation. For one thing, lambda calculi exhibit, in pure form, issues of decidability, non-termination and typing which face computer theorists. Also, the lambda calculus formalism has inspired a range of functional programming languages, including J. McCarthy's

LISP and J. Reynold’s GEDANKEN. Third, model theory for the lambda calculus gave rise to both operational and denotational semantics for programming languages. A semantics for a programming language is ‘operational’ when it explains the meaning of a program in terms of its effect upon the state of an abstract machine; it is ‘denotational’ when the meaning of a program is a mathematical function denoted by that program. P. Landin, in 1965, employed translation into the lambda calculus to give an operational semantics for the language ALGOL. In the early 1970s, Scott and C. Strachey used the ideas behind Scott’s lambda calculus models to give denotational semantics for programming languages exhibiting such phenomena as recursion and non-termination.

Lambert, Johann Heinrich (1728-77)

Lambert was a German mathematician, physicist, astronomer and philosopher, who was among the leading figures of German intellectual life in the late eighteenth century. As a practising scientist, who made important discoveries in many areas, Lambert was interested in philosophical questions regarding the methods of scientific knowledge. In his philosophical works he sought to reform metaphysics by subjecting it to the procedures and standards of mathematics, advocating a combination of conceptual analysis and deductive construction in philosophy. With Lambert the tradition of German rationalist thought reaches directly into the time of Kant, who had great esteem for his analytic skills.

Lambert was born in Mühlhausen, Alsace (then under Swiss dominion). Having received no regular schooling beyond the age of twelve, he was almost entirely self-taught. He undertook his studies and research activities in mathematics and the natural sciences while working in various auxiliary positions in Switzerland and Southern Germany. From 1748 to 1758 he served as tutor to a Swiss family. During the final two years of that appointment he accompanied two of his pupils on their grand tour of Western Europe, which led through the major university towns and allowed him to meet some of the leading scientists of his time. In 1759 he became a member of the newly founded Munich Academy, an association that was terminated in 1762 because Lambert failed to take up residency in Munich. In 1764 he travelled to Berlin, ostensibly on his way to St Petersburg, where he hoped to gain an appointment as member of the Academy. Rather than travelling on, he stayed in Berlin for the rest of his life, becoming a member of the Berlin Academy in 1765 and assuming the post of surveyor of public works in Prussia in the same year.

Lambert was one of the leading mathematicians and natural scientists of his time. In mathematics he proved the irrationality of pi, introduced hyperbolic functions into trigonometry and made contributions to probability theory and the development of non-Euclidean geometry. In physics, Lambert mainly worked on light, heat and humidity of the air. He founded the science of photometry and also made contributions to acoustics and meteorology. In his *Cosmologische Briefe über die Einrichtung des Weltbaues (Cosmological Letters about the Structure of the Universe)* (1761) he developed a hypothesis about the nebular origin of the universe akin to the one developed by Kant in his *Allgemeine Naturgeschichte und Theorie des Himmels (Universal Natural History and Theory of the Heavens)* of 1755, which was not known to Lambert at the time.

Lambert was first and foremost a mathematician and scientist and only second a philosopher. His philosophical works all date from the 1760s and are mainly concerned with questions of method. The major influences on Lambert's philosophical views were Malebranche, Wolff and Locke. Lambert sought to improve the scientific standing of philosophy in general and metaphysics in particular by emulating mathematical procedures in philosophical reasoning. Like Leibniz before him, he was intrigued by the idea of a universal characteristic that would allow the formal presentation and definite solution to problems of all kinds. Unfortunately Lambert did not pursue this project in the last ten years of his life, effectively abandoning philosophy in favour of mathematics and the physical sciences (see Universal language).

The first of Lambert's two main philosophical works is the *Neues Organon oder Gedanken über die Erforschung und Bezeichnung des Wahren und dessen Unterscheidung vom Irrthum und Schein (New Organon or Thoughts on the Investigation and Designation of the True and its Distinction from Error and Appearance)* which appeared in 1764. The work is a treatise on logic in the Pietist tradition of Hoffmann and Crusius, but also reflects the influence of Leibniz, Wolff and Locke. In line with contemporary practice, the more strictly logical core of the *New Organon* is enriched by psychological and methodological considerations. The work is organized in four parts. Part One, which is by far the most extensive, is the 'Dianoiology or Doctrine of the Laws of Thinking' and contains the traditional logical doctrines concerning concepts, judgments and syllogistic inferences. Important innovative topics include the discussion of the methodological status of questions and problems, the role of ordinary as well as scientific, experimental experience, and the distinction between historical and scientific knowledge. Moreover, Lambert introduces a linear symbolism for the representation of judgments, which is then employed in his syllogistic logic.

Part Two of the *Neues Organon* is the 'Alethiology or Doctrine of Truth'. Lambert's key concern here is with the

nature and function of the simple concepts that serve as the building blocks for the logical construction of true propositions. Part Three, the 'Semiotics or Doctrine of the Designation of Thoughts and Things', features the traditional distinction between word, concept and thing but also includes interesting considerations on linguistic confusion. The work concludes with the 'Phenomenology or Doctrine of Appearance' (*Schein*), in which Lambert distinguishes between true and false appearance, discusses probable knowledge and investigates the role of appearance in various forms of cognition.

Lambert went on to apply the logical canon set forth in the *New Organon* in his second main contribution to philosophy, *Anlage zur Architectonic, oder Theorie des Einfachen und des Ersten in der philosophischen Erkenntniß (Plan for the Architectonic, or Theory of What Is Simple and First in Philosophical Knowledge)*, which was published in 1771 but had been finished in 1764. The work provides the propaedeutic for a foundational philosophical science in the tradition of Wolff's ontology or general theory of being. Lambert analyses the basic philosophical concepts and principles with an eye to their eventual use in the edifice of philosophical knowledge. Most of the work consists of detailed, often very subtle examinations of philosophical terms and distinctions. In the procedure of philosophy, as envisioned by Lambert, the analysis of the basic concepts is followed by the axiomatic construction of a body of propositions, which is then applied to experience in the manner of applying mathematics to physical reality. Lambert's own work did not extend significantly beyond the initial, analytic phase of the project.

While Lambert's analyses of philosophical concepts and principles exercised some influence on Tetens and Kant, it was not until some two hundred years after his death that his contributions to the theory of scientific reasoning were properly recognized.

Lange, Friedrich Albert (1828-75)

A German philosopher, social scientist and political activist, Lange was best known for his study of the history of materialism. He was a leading proponent of Neo-Kantianism, a critic of speculative metaphysics, and a defender of the view that philosophy should incorporate the findings of the exact sciences. As a social scientist, Lange described the emergence of a social Darwinian 'struggle for existence' in modern times due to the rapid advancement of industrialization and a growing conflict of interest among social classes.

Cognizant of the scientific trends of his time, Lange anticipated some of the central ideas of pragmatism and adopted a form of conventionalism in regard to scientific principles and concepts. Although sympathetic to materialism, Lange also saw the inevitability of an idealist element in interpretations of natural phenomena and insisted on the importance of projecting ethical, social and aesthetic ideals.

1 Life

Lange was born at Wald and died near Zurich. He was educated at the University of Bonn and later became a university instructor there in 1851. In 1870, he was appointed professor of inductive logic at Zurich. Accepting a professorship at Marburg in 1873, Lange established an influential Neo-Kantian orientation there. By 1861 he became actively involved in politics, working for constitutional reform along democratic socialist lines.

2 Philosophical writings

Lange's most important philosophical work is his impressive *Geschichte des Materialismus und Kritik seiner Bedeutung in der Gegenwart (History of Materialism)*, published in a one-volume edition in 1866 and a two-volume edition in 1873-5. The two-volume edition included references to contemporary scientific theories. A supplementary study, *Neue Beiträge zur Geschichte des Materialismus (New Contributions to the History of Materialism)*, was published in 1867. Two years earlier, he had presented *Die Grundlegung der mathematischen Psychologie (The Foundation of Mathematical Psychology)*. His last work, *Logische Studien (Logical Studies)*, appeared posthumously in 1877.

The *History of Materialism* is a detailed and informative study of the development of materialism from ancient Greece to the scientifically supported modes of materialism emerging in the 1870s. More than a scholarly history, Lange's major work presents perceptive commentaries on physical and biological theories, political economy and ethical naturalism. There is also an extensive discussion of the critical philosophy of Kant in relation to nineteenth-century scientific thought. Lange adopts a restrained positivism in regard to scientific theory and a conventionalist orientation towards scientific principles and posits. He also advocates the construction of aesthetic conceptions of 'the All' from what he called 'the standpoint of the ideal'.

Lange avoids a reductive materialism and argues that a critical analysis of materialism reveals ideal-theoretical principles, concepts and assumptions that cannot be interpreted materialistically. Hence, his considered philosophical position is a form of materio-idealism. Anticipations of pragmatism, scientific conventionalism, instrumental fictionalism and a phenomenalism in regard to scientific concepts can all be discerned in his *History of Materialism*. In terms of his critical commentaries on a variety of scientific theories and their conceptual foundations, Lange anticipated the approach later adopted in the philosophy of science.

Under the influence of Kant, Lange criticized speculative metaphysical claims to a knowledge that transcends experience. He viewed traditional metaphysics as akin to religion and art, as a form of conceptual poetry. The projection of ideals beyond the 'fragments of truth' discovered by the exact sciences was, however, construed as a basic human need. Space, time and causality, as well as the fundamental posits of science, were conceived of as human inventions or, in effect, useful fictions. Lange insisted that the discoveries in the exact sciences must be incorporated into philosophical thought in so far as they are directly relevant to our concept of actuality and theory of knowledge.

3 Social thought and influence

Though less well-known than his study of materialism, Lange's writings on social science were insightful. In

History of Materialism he already predicted that there would be ‘earthquakes’ in the sociopolitical realm due to the decline of the power of religion, the advance of science and the tensions generated by the ‘social problem’. In a neglected study of 1865, *Die Arbeiterfrage in ihrer Bedeutung für Gegenwart und Zukunft (The Problem of the Worker and its Meaning for the Present and Future)*, he analysed the implications of the increasingly rapid industrialization in Europe and its need for an army of workers and skilled technicians. He foresaw a coming social (Darwinian) struggle for existence that would generate radical sociopolitical change. A champion of workers’ rights and sympathetic to democratic socialism, Lange envisaged the emergence of a new class of technically proficient workers who would soon attain a position of leadership among European nations.

In another work of 1865, *J. St. Mills Ansichten über die sociale Frage und die angebliche Umwälzung der Socialwissenschaften durch Carey (J.S. Mill’s Views on the Social Problem and Carey’s Supposed Social-Scientific Revolution)*, Lange displayed his knowledge of J.S. Mill’s liberal-democratic ideas, as well as of Henry Carey’s defence of a capitalist national-economic theory (see Mill, J.S. §12). He was a perceptive analyst, aware of the ‘egoism’ and social atomism that the drive to accumulate capital can produce. Lange held that the rapid economic changes in Europe would lead both to social conflict and radical political oppositions. These views helped shape his socialist sentiments (see Socialism).

The influence of Lange on subsequent philosophers and philosophical trends, though generally indirect, is traceable in some instances. The Neo-Kantianism he inaugurated had a long-range effect on German thought and influenced a number of philosophical scientists (see Neo-Kantianism §§1-2). In social thought he was a forerunner of the conception of social Darwinism, not as an advocate but as a predictor of it. The fictionalist and pragmatic theory of Hans Vaihinger was shaped by Lange’s post-Kantian conventionalist theory of the use and meaning of categories, scientific postulates and theory-construction. Friedrich Nietzsche considered Lange’s *History of Materialism* ‘a real treasure-house, to be looked into and read repeatedly’. He was strongly influenced by him in regard to his own general philosophical goal of uniting philosophy, science and art, as well as in his critical analysis of knowledge.

Langer, Susanne Katherina Knauth (1895-1985)

With roots in logic, philosophy of language and philosophy of mind, Susanne Langer sought to explicate the meaning and cognitive import of art works by developing a theory of symbolism that located works of art at the centre of a network of relations based firmly on semantic theory. Art works were non-discursive, presentational symbols that expressed an artist's 'life of feeling', by which observers, through a process of immediate apprehension (or intuition) came to acquire knowledge.

Langer was educated at Radcliffe College and briefly attended the University of Vienna. She held the post of tutor at Radcliffe from 1927 to 1942, followed by positions at the University of Delaware (1943), Columbia University (1945-50), the Connecticut College for Women (1954-62), and a number of visiting positions.

Langer's early writings prefigure her later theorizing on art. *The Practice of Philosophy* was influenced by work on symbolism by Whitehead and the early Wittgenstein. For Langer, the relation between a symbol and the symbolized object depended solely upon analogy of form; only by studying the structure of an entity and its comparable analogue could the symbolic relationship be established. The logical analysis of symbols - as analogues to one's concrete experiences - admitted of meanings that were incommunicable by ordinary, public discourse. Symbols, through non-discursive form, achieved cognitive weight and force equal to the original experience. As such, they transmitted knowledge of the ineffable. Her second text, *An Introduction to Symbolic Logic*, moved beyond a presentation of standard techniques in symbolic logic to an exploration of its conceptual foundations.

Her explicit theory of art began with *Philosophy in a New Key: A Study in the Symbolism of Reason, Rite and Art*. Combining her interest in the nature of knowledge with a long-standing wish to actualize a complete theory of mind (realized decades later with the publication of *Mind: An Essay on Human Feeling*), she expanded her discussion of symbols by focusing on the role of human reason in ritual acts and the creation of art objects. Challenging traditional philosophical approaches, which had previously located the focus of attention in theories of taste, beauty or notions of aesthetic value, she sought to alter radically the most basic questions in the philosophy of art. Symbolism was the 'new key' to understanding how the human mind transformed the primal need to express oneself. All forms of human activity, including 'speech and gesture, song and sacrifice' were seen as expressive. The mental work of symbolic transformation resided in abstracting a gesture or an object from reality. Symbols, in contrast to signs (later called signals), gave expression to thoughts that went beyond what could be expressed in language. Therefore, a wide range of symbols evolved over time: simple ones became complex; ritual (or convention) became art. Art became the conveyor of inner life: artists expressed 'ideas of feeling' - 'formulation and representation of emotions, moods, mental tensions and resolutions' - not their own actual or personal feelings. The artistic significance of music, for instance, consisted in pure form - 'the sensuous percept' - apart from its literal content (what, if anything, it represented).

In *Feeling and Form*, written eleven years later as a sequel to *Philosophy in a New Key*, art was characterized as the creation of forms symbolic of human feeling. Every work of art involved (1) abstraction from actuality, thereby becoming mere semblance, a created realm of illusion, (2) plasticity (the capacity of being manipulated in the interests of expression), and (3) expressiveness whereby the symbol became transparent. A focus on the meaning of art works was replaced by a discussion of their import or significance. Intuition became the link between the qualities of the art work that constituted it a symbol and the import the work of art held for the observer. Through intuition, we perceive the 'felt life' of the artist's expression.

In *Problems of Art*, a collection of essays originally delivered as lectures, Langer refined her views: a work of art was a form expressive of human feeling, created for our aesthetic perception through sense or imagination. Emphasizing the role that artistic intention played in creative activity, she traced the unity of the arts to their semblance of organic form. Insight (understanding of the essential life of feeling) was designated the aim of art. *Reflections on Art*, a collection of twenty-six essays ranging over music, art, dance, poetry, film and architecture, focused on two main issues: expressiveness and semblance. Her list of contributors included artists and 'lay aestheticians', as well as professional philosophers. Her final work, *Mind*, ambitiously sought to explicate the role feelings play as the mind functions uniquely in humans, and in particular how an artist projects an idea of feeling

by means of art.

Language and gender

How do language and gender interact? This can be interpreted as asking about sexual difference in relation to language-use. How do the sexes speak, how do we speak of the sexes? And could or should these patterns change?

Not surprisingly, understanding language-gender interactions solely in terms of sexual difference yields a static and polarized picture. Men insult and swear, women flatter and wheedle, women draw others out while men monopolize conversations, men are direct and women beat around the bush, women gossip whereas men lecture. Linguistic conventions and familiar vocabulary equate humanity with males (note, for example, so-called generic uses of 'he') and sexuality with females ('hussy', for instance, once meant 'housewife'). Men are linguistically represented as actors and women as acted upon, passive. Men control the institutions controlling language - such as schools, churches, publications, legislatures. Children of both sexes, however, learn a 'mother tongue' at a mother's knee.

Such generalizations contain a few grains of truth, at least if restricted to so-called mainstream contemporary America or England. But they completely obscure the differences among women and among men and the varied forms of social relations so important to gender. One is never just a woman or a man: sexual classifications are inflected by age, class, race and much else. And gender involves not only women in relation to men as a group but also more specific cross-sex and same-sex relations ranging from egalitarian heterosexual marriages and same-sex partnerships through intense friendships and enmities among adolescent schoolgirls to camaraderie among boys on a football team. All such relations are partly constituted by people using language to and of one another; all are informed by and inform larger social arrangements. On the more linguistic side, these include dictionaries, the language arts curriculum and editorial guidelines; arrangements with a gender focus include marriage, high-school dances and gay rights legislation.

Emphasizing large-scale sex difference ignores cross-cultural and historical variation and makes change in language, in gender, or in their interaction appear mysterious. And such an emphasis erases the linguistic dynamics of a particular society's construction of gender. Yet it is in such dynamics that, for example, language shapes and is shaped by sexual polarization and male dominance. This entry highlights approaches to language and gender that root each in historically situated social practice. Linguistic change and gender change then become inseparable.

1 Recent background

In the early 1970s, feminist-inspired interest in sex and gender revived venerable philosophical and linguistic questions about how language, culture and thought interact. During the 1980s and 1990s, feminist scholarship in the USA and Europe took an increasingly linguistic turn, not only in philosophy and linguistics but also in history, literary theory, psychology, politics and sociology. From many different viewpoints, scholars argue that language - and more generally, discourse (see §3) - shapes gender identities and relations and supports male and heterosexual privilege. Outside the academy as well, language figures prominently in gender discussions. Mass circulation publications report that the sexes speak 'different languages'; feature writers complain about feminist 'word police' (and often two sentences later about 'misuses' or 'abuses' of words like *rape*); anti-sexist and gay rights activists invent new terminology (*sexism* or *homophobia*) or renovate the old (using *queer* in positive self-reference or *she* as a generic pronoun).

Language-gender debates, however, include participants with different conceptions both of language and of gender. This section touches on three recent kinds of work: the Anglo-American empirically oriented tradition, psychoanalytic theorizing from French philosophers and linguists, and work on discourse and gender construction from feminist philosophers and other theorists in literary and cultural studies.

Linguist Robin Lakoff's widely read *Language and Woman's Place* (1975) framed much subsequent discussion by American linguists and social scientists and some philosophers. Lakoff argued that women face a double-bind. To sound feminine they must speak indirectly and euphemistically; that style, however, is derided as ineffective in public arenas. She argued also that women were systematically derogated when spoken of, that language used of women conventionally implied that they were less worthy and important than men. Although she did not join in

the widespread critique of masculine generics (for example, *man* for humans generally or *he* with a general antecedent; see the introduction to Frank and Treichler (1989) for a discussion of this topic), she noted instructive examples of asymmetries in linguistic resources for speaking of men and of women: *cleaning lady*, for instance, versus the non-occurring *garbage gentleman* or the metaphorical extension of animal or food terms to refer to women, such as *cow* or *tart*.

Others challenged Lakoff's ideas. Linguists such as Janet Holmes (1995) pointed to the multiple functions of linguistic forms. For example, rising intonation on a statement, a form Lakoff interpreted as signalling women's uncertainty or insecurity, can facilitate effective communicative interaction, inviting others to speak. Tag questions ('he's pathetic, *isn't he*?') have a similar range of functions. Lakoff's critics also noted the cultural specificity of speech styles (for example, many African-American women reported Lakoff's characterizations inapplicable to their everyday speech). Furthermore, some (most notably, Penelope Brown (1980) and Marjorie Harness Goodwin (1990)) argued that sex-differentiated rhetorical strategies are not arbitrary cultural conventions. They arise as strategic responses to general social constraints and the specific demands of particular communicative contexts. Women's linguistic agency began to be explored, not just their victimization.

During the same period, some French thinkers began to articulate feminist perspectives on post-structuralist or postmodern views of language. The post-structuralist stance does not take language as a closed system for representing a pre-existing reality (see Postmodernism §2). To speak or write is never a neutral act of encoding, as dominant Anglo-American views of language seem to suggest, but always enacts a self; language is constitutive of subjectivity.

Psychoanalysis, Freud's 'talking cure', has always given language a prominent place, and French psychoanalyst Jacques Lacan made it central in his interpretation of Freud. Linguistic communication, he proposed, is an attempt to erase the first and most traumatic psychic pain, the wrenching separation of birth. To speak is to try to reconnect with the mother, or, more generally, to connect to another; this attempt at (re)connection is inherently phallic. Moreover, to speak and be understood requires one to submit to patriarchal social laws, to place oneself under the Law of the Father. None of this is a matter of being male or female: women can and do speak and write but linguistic communication remains phallic, not feminine, at a deep psychosexual level (see Feminism and psychoanalysis).

Then is silence the only feminine linguistic move? The linguistic and social *status quo*, though powerful, are not stable closed systems. Breaks in the discourse, slips of the tongue, puns, parody and repetition, all bespeak psychic difference and potential resistance, and offer a glimpse beyond the Law of the Father. Such moves disturb and destabilize the patriarchal *status quo*; they can render audible a feminine voice outside the phallic linguistic order. Again it is not sex that is at issue: a man's speech or writing may inscribe a de-centring feminine voice, exposing the instability of the ruling order and threatening its hegemony. Although the French postmodern turn does not necessarily promote the dismantling of male privilege, there is a strong feminist strain in such thinking. The feminine and masculine within each person - a kind of bisexuality - is the fulcrum on which Luce Irigaray and Hélène Cixous, for example, balance femin*ist* politics. Although their specific projects differ, both make femin*ine* outside voices more prominent, and they subvert in varied ways established patriarchal assumptions and values.

Both early American emphasis on sex-differentiated modes of speaking and sexist linguistic resources, and the French focus on the psychosexual significance of language, seemed to take sexual difference and male dominance as given, as prior to linguistic practices. Women and men, the feminine and the masculine - these were unequal poles existing outside language. During the mid-1980s and early 1990s, however, a number of English-speaking feminist philosophers and other cultural and social theorists explicitly questioned the 'naturalness' of heterosexuality and of polarized and hierarchized gender oppositions. They reread thinkers like Irigaray (1977) and emphasized the role of discourse in constructing gender identities and relations, noting that linguistic abstractions and other symbolic practices are central to constructing categories of sex and sexuality. Queer theory especially emphasized the instability of those categories, their emergence from performance, and thus the possibility of alternative forms of gender and sexuality (see, for example, Butler 1990). In a related move, thinkers with a more empirical bent began to conceptualize gender as emerging from social practice (see, for example, Connell 1987).

2 Gender and language in social practice

Much early empirical work took gender and language each as independent structured systems. Researchers asked whether these systems were correlated or connected but not how such connections might arise or why they might matter. Social practice theory suggested a different strategy. Do not look at language and gender as macrosystems; look instead at the microlevel of social activities and conventions for understanding and regulating them. Both gender and language systems can be seen as rooted in social practice; because a single activity often has both gender and language implications, these roots intertwine. Even shared roots do not, however, guarantee that the separate structures supported will connect at higher levels.

What does it mean to say that language is rooted in social practice? Natural language grammars have been argued (most notably by Chomsky and followers) to be tightly constrained by the nature of human minds, seen in this respect as sexless - and likewise unaffected by race, class and geographical origins (see Chomsky, N.; Language, innateness of). From this perspective, fruitful for much linguistic inquiry, social life seems inconsequential to the forms of language. Specifying grammatical possibilities, however, does not tell us everything about language in human history.

At the simplest level, people aim at coordinating their grammars so that communication works reliably within a community. They also talk like those around them simply in order to mark themselves as a social collectivity. Thus controversial questions arise: which grammar(s) or language(s)/dialect(s) should a particular community use? Who adjusts to whom? How do male-dominated institutions affect choice among linguistic possibilities? And (nearer the periphery from a grammatical viewpoint but central for language-users) which words with which meanings are part of shared resources? What difference can vocabulary make to thought and social interaction?

This latter question moves us beyond the form of a community's linguistic resources to the functions those resources serve. What are norms for using language? Are women supposed to listen to men more than men to women? Is it mostly men's linguistic formulations of ideas that enter common currency and serve as background when others speak and write? Who jokes and when? Who swears and when? Who is polite to whom and why? Who suggests and who orders? In which situations and to which addressees? Which meanings are contested? When, where and for whom is silence or talk prescribed? In most communities, doing things with words is highly inflected by gender relations - and also by class, race, age and other dimensions of social difference and hierarchy.

Even more than language, gender is assumed to be built on a biological foundation. Virtually all cultures sort people at birth into one of two sex categories - female and male. External genitalia, which generally predict potential reproductive roles, mark sex at birth. Thereafter, however, other socially constructed markers take precedence. In most social groups sexual classification is associated with power relations, division of labour and regulation of many other areas of life including erotic activity (heterosexism and racism, for example, dictate that desire should be directed only towards someone of the other sex and the same race). Even what we think of as most 'biological' - the roles played in species reproduction - can be affected by social activity. Consider such historical developments as bottle-feeding, frozen sperm and test-tube babies. Just as strikingly, cultures differ dramatically in the range of gendered identities they offer (not all, for instance, stop with two sexes) and the kinds of gender relations that prevail.

The substantive content of gender derives from social practices and the attitudes and expectations that drive and support them. Some areas of gender practice seem independent of language: for example, styles of dress and other kinds of bodily adornment and demeanour, conventions regulating who touches whom when and where and what the reaction should be, participation in competitive sports, food preparation and serving. Even these, however, connect to linguistic practices. A person's clothes and visual style may get them dubbed 'slutty' or 'elegant', silence is deemed consent to sexually charged touch, locker-room talk is judged unsuitable for female ears, a group of women talks in the kitchen while their male partners trade comments about the football game on the living room television.

Writing is also important. Teen magazines have articles on lip gloss and diet, self-help books advise on female orgasm, newspapers devote much of their space to sports stories and use sports metaphors even in articles about business or politics, women's but not men's magazines include many pieces on food for family and for entertaining. Of course neither speech nor writing is just words. Teen magazines, for example, link to huge cosmetics and fashion industries and to the myriad of institutions and practices pushing teenage girls towards

(exclusively heterosexual) romance. But the bottom line is that social practices of all kinds have rich linguistic texture: language is central to social life.

3 Connecting two different conceptions of discourse

The emphasis of much recent feminist thinking has been on discourse as a global feature of culture, what I will call cultural discourse. We might, for instance, talk about the (cultural) discourse of romance in which talk, writing, clothing, photographs, film and much else present romance as normatively heterosexual, females' primary aspiration in life, the only important form of cross-sex relations, and so on. Cultural discourse covers background assumptions, favoured rhetorical strategies, vocabulary, and nonlinguistic activities and representations that highlight some perspectives on a particular domain (for example, intimate interpersonal relations) and obscure others.

Linguists and many philosophers of language use a notion of discourse more narrowly linguistic and less global. What I will call a situated discourse consists of a historically located series of connected utterances or inscriptions - for example, a conversation or a written narrative. For analytic purposes we can identify a (situated) discourse with a string of sentences together with relevant aspects of the contexts in which the sentences are produced and interpreted. Cultural discourse can be seen as grounded in situated discourses, whose detailed analysis may shed light on the microstructure of larger discursive constructions of gender.

Studies of language in use give concrete linguistic content to claims about the discursive production of sex, sexuality and gender. For example, names and styles of address start forming sexed identities early on (nurses in one hospital were heard calling baby girls 'sweetheart' or 'beautiful', but using 'Jones' for the baby boy with that surname). Adolescents draw on categorizing practices that link sex and sexual decorum with social class when they label someone 'slut'. Engagement in same-sex verbal tussles (direct insults, often overlaid with humour, or 'he-said/she-said' tales about absent parties), heterosexual harassment (street comments on a woman's body) or the discourse of romance (identifying four-year-olds' opposite-sex playmates as their 'sweethearts') - such everyday language-use helps shape and sustain particular forms of gender identity and relations.

Less everyday language-use is also, of course, critically important. Sermons or scriptures may enjoin women's silence in places of worship or other forms of sex-differentiation and hierarchy. And social scientists write about gender, often equating it with statistically significant sex differences (and ignoring its inseparability from matters of class, race, gender and even age). We find, for instance, sweeping and dichotomizing claims about how women and men speak. Such work is popularized and becomes enormously influential. It gets used not only for interpreting but for regulating gender-language connections: not only is this 'on average' how women and men speak but this is how 'real' or 'nondeviant' women and men speak or ought to speak. (Although Tannen (1990) herself avoids such normativizing, her many readers have not.)

Social life depends on social interaction, whether face-to-face or more diffuse and larger in scale. Interactions are made up of more than situated discourses, of course, but language is central to most of them and virtually essential to large-scale and long-distance social exchange. Situated discourses are the primary ingredient of social life: cultural discourses derive much of their substance from situated discourses.

All situated discourses are constrained by conventions and institutions predating them. All, however, have potential effects on subsequent discourses and, more generally, on social structural constraints affecting talk and understanding, on cultural discourses and other macro-level social arrangements. For example, when talking about people in general, saying 'Each must do what she thinks best' will startle many listeners: English classes have prescribed 'Each must do what he thinks best' in such contexts. The feminine generic goes against familiar conventions, yet its increasing use (notably in American philosophical writing) begins to establish an alternative convention. The more it is used the less it shocks.

4 Changing language, changing gender

'Sticks and stones may break my bones but words will never hurt me', chant children trying to defuse the sting of labels like 'sissy', 'faggot' or 'bitch'. They seek to convince themselves and their tormentors of the view, widely endorsed in one form or another, that language has no force, is causally inert. As formal objects on their own, of course, words (more generally, languages) do not hurt people or do anything else to them. But words in use do

indeed affect people in many ways: they convince, persuade, enlighten, frighten, humiliate, amuse, disgust, titillate. Words link to social arrangements on the one hand (see Speech acts), and to causally relevant features of courses of events on the other (see Reference). These links give them many kinds of power in human affairs and thinking, both individual and collective. Thus it is not surprising that language change and social change might go hand in hand.

Take a simple example. Labelling people affects how those people and their labellers then enter into a host of social practices. Until recently most communities using American-English conventionally assigned adult women social titles on the basis of marital status (‘Mrs’ or ‘Miss’), whereas men’s social titles were not so differentiated (‘Mr’ being the only option other than occupational and professional titles). The introduction of ‘Ms’ offered women a title option supposedly neutral as to marital status. This option was adopted by a diverse group including advertisers who did not want to offend by making mistaken assumptions about marital status, young unmarried women wishing not to advertise themselves as single, and self-described feminist women claiming a status equivalent to that of male peers (whether husbands or not). There have been other changes in linguistic practice connected to marriage, sexuality and family: for example, more women retain a pre-marriage surname or hyphenate surnames, some couples create a new shared surname, and some use the mother’s surname for a child; even women who have adopted a husband’s surname frequently favour ‘Ms/Mrs Jane Doe’ over the formerly dominant ‘Mrs John Doe’ form; employers and others now inquire about a ‘spouse’ (or even a ‘partner’, finessing both marital status and sexual preference) rather than a ‘wife’; marriage ceremonies much less often ask a woman to ‘obey’ a husband, and those officiating frequently pronounce the couple ‘husband and wife’ rather than ‘man and wife’; same-sex couples go through marriage-like rituals and adopt common surnames; ‘parent’ has acquired a use as a verb (which is semantically far closer to the verb ‘to mother’ than to the verb ‘to father’).

Such changes in sociolinguistic practice have accompanied nonlinguistic changes in the institutions of marriage and family and practices associated with them. Middle-class women are less likely than they used to be to assume their economic welfare and social position will derive from husbands’ income and status. Not only do young women see divorce as a real possibility, they also see themselves as capable of significant earnings and professional achievement, whether or not they opt to marry or to have children. Some men see caring for children - parenting - as a central role for part of their lives. Heterosexual marriage of the traditional hierarchical and strongly sex-differentiated kind, though still in many ways the default option for middle-class Americans, is increasingly seen as not the only choice open, not even for women who want to bear children. Adding ‘Ms’ as a title option for women and changing laws about surnames of married women and their children could not have increased women’s participation in high-level careers if all else had remained the same, just as having available the sex-neutral verb ‘to parent’ does not suffice to get men more actively engaged in the activity it denotes. But changes in linguistic practice have been (and continue to be) part and parcel of changes in gender practices - the linguistic and nonlinguistic developments reinforce one another.

Linguistic practices change all the time. For example, new words or terms are introduced. ‘Surrogate mother’ designates a kind of relation of woman and child not earlier envisaged (and carries with it certain assumptions about the social weightiness of that relation); ‘sexual harassment’ groups together, on the basis of similar effects, kinds of situations previously either ignored or seen as very different in kind (‘sexual teasing’, for instance, and ‘seduction’). Of course, new expressions draw on associations with existing ones: ‘sexism’, for example, developed meaning in part through the implied analogy with the word ‘racism’. Sometimes an existing form is altered in its uses, as when ‘partner’ comes to designate the person with whom one lives in a sexually intimate relationship, whether that relationship is sanctioned by the state or religious authorities, whether the person so designated is a woman or a man, and whether of the same sex as, or opposite sex to, oneself. But the implication of equality remains from other uses of the term ‘partner’.

Customary usage may change while reference stays fixed. Some have begun to say ‘my child’ or ‘my kid’ in contexts where most people still say ‘my daughter’ or ‘my son’, to say ‘kids’ rather than ‘girls and boys’, and in other ways to resist identifying everyone always in sex-specific terms. The linguistic system and its interpretation are not thereby changed, but patterns of language-use are and with them what is implicated when people speak, what we take them to mean above and beyond what their words literally say (see Implicature). There are no explicit norms that say adults must identify a person to children by using ‘that woman’ or ‘that man’ or similar sex-specific forms, yet this is standard practice: ‘Say thank you to the nice lady’ rather than ‘Say thank you to the

nice person who gave you that sweet'. Changes in such practices might ultimately help effect major shifts in gender polarization and emphasis on sexual difference, an emphasis important for enforcing heterosexuality.

Could some group impose what might seem desirable linguistic and related social changes? Should they? History shows that some regulation is possible: for more than a century, schools and editors, for example, have proscribed singular 'they' (used by Shakespeare, Jane Austen and many others, including me and the authors of other *Routledge Encyclopedia of Philosophy* entries) and prescribed a supposedly sex-indefinite 'he'. Simply removing institutional sanctions (poor grades, having an article rejected) from the use of singular 'they' would almost certainly greatly reduce use of supposedly generic 'he'. But of course some people might continue its use, and even those who have dropped it might nonetheless speak in other ways indicating a view of humans as normatively male: 'During the night the villagers left in canoes, leaving us behind with the women and children.'

Linguistic conventions, both those that narrow the range of linguistic systems on which community members can draw and expect to be understood and those that promote certain patterns of usage (for instance, when to say 'thank you'), only constrain and never completely determine what community members will say. People can in various ways challenge and resist such conventions or exploit indeterminacy in them as to form and meaning. And other people can make countermoves as in the charges of a silly 'political correctness' hurled at those who have drawn attention to social biases implicit in existing linguistic conventions and have proposed alternatives. No social standpoint monopolizes all moves; subordinated interests can find expression. This does not mean that social advantage confers no linguistic advantage (it does) or that linguistically aided social change is not possible (it is). But total control of language use (and therefore of the patterns of thought and action it might facilitate) is only an Orwellian nightmare, not a real possibility. And, as many feminist thinkers have reminded us, quick linguistic fixes for sexism and heterosexism are just pipedreams (see the guidelines in Frank and Treichler 1989).

Language of thought

The 'language of thought' is a formal language that is postulated to be encoded in the brains of intelligent creatures as a vehicle for their thought. It is an open question whether it resembles any 'natural' language spoken *by anyone. Indeed, it could well be encoded in the brains of people who claim not to 'think in words', or even by intelligent creatures (for example, chimpanzees) incapable of* speaking *any language at all. Its chief function is to be a medium of* representation *over which the* computations *posited by cognitive psychologists are defined. Its language-like structure is thought to afford the best explanation of such facts about animals as the productivity, systematicity and (hyper-)intensionality of their thought, the promiscuity of their attitudes, and their ability to reason in familiar deductive, inductive and practical ways.*

1 The language of thought hypothesis (LOTH)

One of Descartes' greatest challenges to the materialist theory of the mind was that it was impossible to imagine a physical device capable of the diverse intelligent behaviour often exhibited by human beings. Frege's development of formal logic, and then Turing's conception of a Turing machine offered the promise of a serious reply to this challenge, since they showed how at least deductive reasoning could be realized as a form of mechanically realizable computation (see Turing machines; Mind, computational theories of). Their proposals were an inspiration for the development of computational formalisms for various forms of non-deductive reasoning: induction, abduction, practical reason and decision theory.

But computations presuppose representations (Fodor 1975): the computations of Turing machines and many computers are, for example, often defined over *numerals* that represent *numbers*. A suggestion that has been advanced by a variety of philosophers and cognitive scientists (Harman 1973; Newell and Simon 1972; Fodor 1975, 1987) is that thinking requires precisely the sort of representations that are standardly used to *identify* thoughts, namely *sentences*: representations with logico-syntactic structure, of the sort defined recursively in logic texts in terms of names, predicates ('is bald'), variables ('*x*', '*y*'), connectives ('and', 'only if'), quantifiers ('all', 'some') and various operators ('probably', 'necessarily'). Thus, the thought that 'Necessarily God does or does not exist' is normally identified by using that sentence (or a translation of it).

The language of thought hypothesis (LOTH) is then the hypothesis that thinking consists in performing computations on sentences whose logico-syntactic parts are causally efficacious, for example, by being encoded in a creature's brain. The process is akin to theorem-proving in logic, except that, where the rules of logic are ordinarily applied by us *consciously following* the rules, according to LOTH the rules are applied by virtue of the causal structure of the brain. For example, where, in elementary logic, we follow the rule *modus ponens* - 'From "*p*" and "If *p* then *q*" derive "*q*"' - for LOTH the brain is so constructed that, if it is in a state that represents the premises, then it is (sometimes) caused to enter a state that represents the conclusion.

'Thinking' here is a generic word for processes involving propositional attitudes, and these are distinguishable in at least two ways that are often blurred in ordinary talk: by their *contents* (the sentence complement, for example, the that-clause, that follows the attitude verb) and by the different *relations* the agent may have to the same such contents, for example, *believing* or *hoping* that God exists (see Propositional attitudes). According to LOTH, different propositional attitudes of an agent involve different computational relations borne by the agent to sentences in a language of thought (LOT) that express the various thought contents of the agent. To a first approximation (see also Field 1981):

For any agent, *x*, and propositional attitude, *A* that *p*, there exists some computationally definable relation C_A such that:

$$x\ A\text{'s that } p \quad \text{iff} \quad \text{for some } \sigma\text{: } (xC_A\sigma\ \&\ \sigma) \text{ means that } p$$

For example, actively judging or desiring that God exists might be defined in terms of different computational relations, *J* or *D*, that an agent, *x*, might bear to a sentence, '$(\exists x)Gx$', that expresses the proposition 'God exists'.

LOTH must, of course, specify the computational relations for specific attitudes, as well as provide an account of how a symbol in the brain can have a specific meaning. For the first task it appeals to the familiar flow-charts of cognitive psychology. Judgment, for example, might be the output of perceptual and reasoning systems that is the

input to a decision-making one. For a theory of meaning, LOTH has turned to (combinations of) 'informational' approaches (Fodor 1987), teleological approaches (Neander 1995) and 'computational role' approaches (Field 1981).

Note that, *pace* Searle (1984; see also Chinese room argument), LOTH does not entail that syntactically defined sentences in a LOT do not have many real and important semantic properties; all that is claimed is that the relational clause and the causal processes of thinking are specifiable syntactically. However, there are some LOTH proponents (for example, Jackendoff 1987) who do seem to think that syntax would be enough to determine semantics, and others (for example, Stich 1983) who argue that the semantic clauses are not in principle determinate.

2 Arguments for LOTH

Although some philosophers (for example, Davies 1991) have ventured a priori arguments for LOTH, the chief arguments for it are that it provides the best explanation of at least the following phenomena (see Rey 1997: chaps 8-9 for a longer list).

The productivity of attitudes. People seem to be able to think a potential infinitude of thoughts, that is, to a first approximation, people can (in principle) think all permissible combinations of the primitive syntactic elements. For example, they can understand a conjunction of $n + 1$ sentences if they can understand *n* of them. Some theorists have baulked at the substantial idealization (from memory, mortality) that this involves, and so Fodor (1987) proposed a related, but more modest claim:

The systematicity of attitudes. Anyone who can think *p* can think any logical permutation of *p*: for example, if someone can think that 'Ann hates Bob only if Charles loves Di', they can also think that 'Charles loves Di only if Ann hates Bob', 'Di loves Charles only if Bob hates Ann' and so on for all permissible logical permutations. LOTH captures both productivity and systematicity by presuming that any system in which the logico-syntactic elements of sentences are causally efficacious is one in which they are readily available for recombination.

Rational and irrational relations among attitudes. Both deductive reasoning and many common fallacies are 'structure-sensitive', involving the scopes of operators, for example, negations, conditionals and quantifiers (see Scope). Quantifier scope is what distinguishes, for example, 'Everyone loves someone' form 'There is someone whom everyone loves'. Standard treatments of logic capture such structural facts in the terms of logical syntax. By insisting that that syntax is causally efficacious, LOTH is able to explain people's ability to reason, and why they are prone to certain errors (for example, misrepresenting a scope).

The (hyper-)intensionality of attitudes. Propositional-attitude ascriptions are 'intensional': terms that (even necessarily) refer to the very same thing cannot be substituted for one another without risking a change in the truth-value of the whole. There is a difference between thinking 'Water is wet', thinking 'H_2O is wet', and thinking 'The stuff of rain is wet', despite the fact that water = H_2O = the stuff of rain. LOTH distinguishes these attitudes by distinguishing syntactically between different symbolic structures to which an agent can be related (it can even distinguish them when the structures have the same 'meaning', as in *hyper*-intensional cases such as remembering that a fortnight is a fortnight as compared with remembering that a fortnight is two weeks).

The multiple roles of attitudes. Different attitudes can be directed at the same thoughts. People often *wish* for the *very same thing* that they *believe* does not presently obtain; they often come to *think* what they previously only *feared*. LOTH captures this by positing different computational relations to the same internal representation (or ones with the same content).

3 Some common objections to LOTH

Many people claim introspectively not to 'think in words', but, rather, for example, in mental images (see Imagery). Now, in the first place, LOTH is not meant to be establishable by introspection; it is purely an *explanatory* hypothesis. Moreover, by careful delineation of the different computational roles of specific representations, some (for example, Pylyshyn 1981) have argued that it can capture imagistic experiences, and even subjectivity and sensation (for example, Lycan 1990; Rey 1992).

But, second, it is difficult to think of a non-linguistic representational system with anything like the expressive power of a linguistic one. *Purely* imagistic systems, for example, do not seem adequate to represent logically complex thoughts - for example, negations, conditionals, nested quantifications - nor to distinguish thoughts about a general category (for example, cow) from ones about a particular instance (Elsie), for which the same image might serve.

Note that LOTH is not committed to the language of thought being confined only to creatures that speak a natural language, much less to the language of thought actually *being* a natural language. According to LOTH, any creature that*thinks* (as, for example, chimpanzees seem to do) will need a LOT, whether it *speaks* or not.

Wittgenstinians often object that LOTH presupposes the very sorts of processes it purports to explain: if there is a LOT, do we not need an ‘homunculus’ in the brain to read it? LOTH answers this objection by emphasizing Turing’s proposal for computation in general, whereby brute causation replaces human calculation.

But did Wittgenstein’s ‘private language’ argument not show that languages are necessarily public? (See *Philosophical Investigations* §§243-; Private language argument; Wittgenstein, L. §13.) Wittgenstein was concerned, however, only with languages whose references could not be publicly ascertained (for example, because they referred to ‘private sensations’). LOTH makes no such commitment.

Dennett (1987: ch. 3) argues that many attitude ascriptions are merely ‘interpretations’ of behaviour that do not commit us to a corresponding sentence in the head. For example, we might say of a chess-playing computer that ‘It likes to get its queen out early’, even though there might be no corresponding sentence manipulated by the computer’s program. However, LOTH is not committed to the literal truth of *every* ordinary ascription; only ones that figure in a causal explanation of such phenomena as those mentioned above.

The chief rival to LOTH is the so-called ‘radical connectionist’ models of cognition (in contrast to connectionist models that are merely implementations of ‘classical’ ones such as LOTH). Defenders of radical connectionism complain that LOTH models are too rigid, inefficient and not as neurophysiologically realistic as connectionist networks (see Smolensky 1988). However, the cognitively relevant physical properties of the brain have yet to be sufficiently identified to pass judgment on such a claim, and it has yet to be shown that radical connectionist theories can explain all the above phenomena as well as a language of thought does (see Connectionism).

Language, ancient philosophy of

The earliest interest in language during the ancient Greek period was largely instrumental: presumed facts about language and its features were pressed into service for the purpose of philosophical argumentation. Perhaps inevitably, this activity gave way to the analysis of language for its own sake. Claims, for example, about the relation between the semantic values of general terms and the existence of universals invited independent inquiry into the nature of the meanings of those general terms themselves. Language thus became an object of philosophical inquiry in its own right. Accordingly, philosophers at least from the time of Plato conducted inquiries proper to philosophy of language. They investigated:

(1) how words acquire their semantic values;
(2) how proper names and other singular terms refer;
(3) how words combine to form larger semantic units;
(4) the compositional principles necessary for language understanding;
(5) how sentences, statements, or propositions come to be truth-evaluable;

and, among later figures of the classical period,

(6) how propositions, as abstract, mind- and language-independent entities, are to be (a) characterized in terms of their constituents, (b) related to minds and the natural languages used to express them, and (c) related to the language-independent world.

1 Pre-Platonic figures

Before Plato, evidence for inquiries into the semantic and syntactic features of language is sketchy, if suggestive. Even so, there is clear interest in language among pre-Platonic philosophers, rhetoricians and Sophists. In some cases this interest is motivated by a concern for developing persuasive speech, primarily for forensic or political use (see Rhetoric §1). In other cases, it has a more philosophical orientation. Thus, quite early, Parmenides (early to mid-5th century BC) sought to exploit a putative fact about language when defending an improbable form of monism: he argued that 'what is for saying and thinking must be' (fr. 6) and concluded that it is impossible to speak or think of what does not exist, with the consequence that it is equally impossible to speak or think of generation, change, or plurality, since each of these is implicated, directly or indirectly, in what is not. With the additional thesis that it is possible to speak and think of everything which exists (fr. 3), Parmenides concludes that the universe is an eternal undifferentiated unity, altogether remote from the appearances of plurality, change and generation delivered by the senses (see Parmenides §2). When Plato and Aristotle later exposed the fallacy in this argument, it was mainly by distinguishing syntactic and semantic features of the verb *to be* which Parmenides had failed to mark.

The Sophist Gorgias (late 5th century BC) similarly appealed to features of language when attempting to establish the nihilistic theses that:

(1) nothing exists;
(2) even if something did exist, it would be unknowable;
(3) even if something did exist and were knowable, it would be incommunicable.

On behalf of the odd counterfactual (3), in particular, he appealed to a subjectivist form of meaning: if something were perceived, it could be communicated only by means of a sign, which, even on the untenable assumption that it could be made to represent the supposed object of perception perfectly, could not be shared by more than one mind. Hence, communication about objects perceived is impossible (see Gorgias §3). However implausible this argument may sound, it is worth remarking that it appeals to a thesis about meaning that many find natural and attractive; indeed, many centuries later, Frege still felt the need to mount positive arguments against just its kind of semantic subjectivism (see Frege, G. §4).

The atomist Democritus (mid 5th-4th century BC) reportedly composed a treatise *On Words*. In this or another work he inaugurated an important discussion, taken up with great earnestness by later philosophers, concerning the signification of names. Democritus thus stakes out what appears to be the first case for a dedicated semantic

theory. He thus moves beyond the primarily instrumental interest in the semantic features of language displayed by his predecessors.

Democritus evidently argued for a form of *conventionalism*, according to which the relation between names and things named is determined by agreement or legislation. He argues that there cannot be a natural relation which ties a word to the world, since:

(1) there are homonyms, that is one name for different entities (for example, ’bank’);
(2) there are synonyms, distinct names for the same thing;
(3) entities can change names in the course of their existence.

Consequently, it would be wrong to suppose that a name is determined by anything other than an arbitrary designation.

In arguing this way, Democritus means to reject *naturalism*, a view according to which names and things named are related by some non-conventional relation. A first approximation of naturalism might be the view that all naming is at root onomatopoetic or somehow pictographic. Put thus crudely, naturalism may seem a non-starter. But other forms of naturalism, loose by comparison with these simpler versions, appeal instead to natural descriptions, with the result that names, especially proper names, all turn out to be disguised definite descriptions. Making naturalism more tenuous still, a fair number of naturalists were in the habit of appealing to the origin of names and other words, thereby confusing genetic and semantic questions.

Although in these varying contexts, the varieties of ’naturalism’ were unhelpfully conflated, the contrast between conventionalism and naturalism is important for the history of classical semantics for three related reasons. First, the ensuing debate, much of it quite subtle and sophisticated, is initially couched in terms of a contrast between conventionalism and naturalism, and even in late antiquity data to which naturalists appeal appear in a surprisingly forceful way. Second, part of the motivation for naturalism turns out to be reasonable: naturalism, unlike some varieties of conventionalism, seemed to capture the normativity of language. Some names are correct and fitting, while others are incorrect or otherwise inappropriate. It is hard to specify precisely how this can be the case if spoken sounds are applied to things in a purely conventional manner, especially when conventions may be generated quite locally. Third, whatever its ultimate faults, naturalism at least attempts to explain how reference occurs. In some of its ancient forms, conventionalism had difficulty even broaching a suggestion on this point.

2 Plato

The opposition between conventionalism and naturalism dominates Plato’s most explicit and extended treatment of language, the *Cratylus* (see Plato §15). The dialogue opposes equally untenable naturalist and conventionalist theories of naming, while at the same time promoting the virtues of each. Plato focuses initially on proper names, but it is clear that his interest extends to other singular terms and to general terms as well. Perhaps Plato means to explore facts about reference by laying out extreme forms of views which, though incompatible, each have some merit. At any rate, in the course of the dialogue he sets aside the most implausible features of conventionalism and naturalism without detailed comment.

These implausible features are, however, fully present in the initial presentations of each theory. Cratylus opens the dialogue, arguing on behalf of naturalism that it is possible for someone not to be named *n* even if ’all people were to call’ him *n* (383b6-7, cf. 429b12-c2). This is because, as we later learn, ’*n*’ is the name of something only if it bears a natural relation *R* to that thing, where *R* is specified by Cratylus only incompletely as a kind of mimetic or imitative relation (423b-428a, 430a10-b1). Thus, something qualifies as a name *n* only if it is correct, that is, only if it imitates the thing named and indeed indicates what that thing is (428e1-2).

Hermogenes responds on behalf of conventionalism:

> I cannot be persuaded that there is some correctness (*orthotēs*) of names other than convention and agreement. For it seems to me that whatever name someone gives to something, this is the correct one…. For no name is suited by nature to anything, but rather by the custom and habit of those in the habit of using it and calling things by that name.
>
> (*Cratylus*, (384c10-d9)

Hermogenes' conventionalism may seem initially more plausible than any variety of naturalism. Yet he is taken to task for failing to consider external constraints on convention. More importantly, names have the dual function of conveying information and distinguishing real natures in the world 388b7-11); if a name misses or obscures these real natures, then it will not succeed as a name, or at any rate will be at best only a sub-optimal name. Plato suggests that even this degree of normativity is incompatible with the version of conventionalism Hermogenes espouses.

In opposing this kind of conventionalism, Plato does not adopt Cratylus' naturalism. On the contrary, the Socrates of the dialogue, who evidently represents Plato's point of view, is equally critical of a naturalism which fails to distinguish between the correct name of an entity and the name which people actually employ when designating that entity. Socrates thus twice embarrasses Cratylus by forcing him to allow that his theory cannot distinguish between successfully referring to an object and referring to it correctly (429c3-5 and 429e8-430a5). The point, updating Plato's example a bit, is this: if a child points to a whale, exclaiming, 'That fish is bigger than our house!', the child has evidently successfully referred to the whale, but only incorrectly. Cratylus must allow that not only has the child failed to designate the whale, but also may have produced a false sentence by referring to a minnow in the whale's neighbourhood.

Plato, in the end, agrees with the naturalist that there must be some relation *R* which in a direct or indirect way relates a name to a thing named; but he denies that *R* can be specified in a way which wholly ignores convention. So, he equally agrees with the conventionalist that convention is relevant to determining names; but he denies that convention by itself can determine *R*. For he believes that names are information-bearers which, if correct, reflect the structure of the extra-linguistic world. Thus, the argument of the *Cratylus* has the effect of distilling what is right from both conventionalism and naturalism, and of laying down the constraints for a semantically and metaphysically adequate account of reference. It also advances the debate by distinguishing different ways in which a name may be said to be correct or incorrect: a name may be correct in a pragmatic way by fulfilling its reference-fixing function, or correct in a descriptive way by carrying information which accurately reflects the world. Plato appreciates that these functions may come apart in ways which make the job of specifying *R* exceedingly difficult. He himself does not, however, offer an articulated account of the no doubt complex relation *R*. Instead, the dialogue ends in perplexity.

Although it contains his most self-conscious and sustained treatment, the *Cratylus* hardly exhausts Plato's views on naming or language more generally. Of special note are his complex discussions of the various syntactic and semantic functions of the verb *to be*, conducted most thoroughly in the *Parmenides* and *Sophist*, both late dialogues. In the (*Parmenides* (142a, 161e-162b), raising a puzzle about saying truly '*a* is not' (we cannot predicate something of *a* unless *a* is; but then we cannot do what we plainly can do, namely deny the existence of something), Plato takes up a discussion about negative existentials which continues even today (see Existence). When, in the *Sophist*, he responds to the Parmenidean argument for monism, Plato quite rightly focuses on distinct uses of 'is'. The distinction remains an important philosophical tool for recognizing and diagnosing fallacies.

3 Aristotle

Aristotle approaches the study of language with a logician's eye. He seeks to determine how terms relate in syntactic structures of various sorts, mainly to determine and regiment the correct and incorrect forms of inference-drawing. Accordingly, he investigates the nature of meaning, the difficulties of reference, and the errors which result from failing to attend to what he calls the *homonymous* uses of words, that is the uses of words with a plurality of distinct but connected meanings, including especially core philosophical terms whose non-univocity may initially elude us. He thinks that when they seek unified definitions of these sorts of terms - at any rate, non-disjunctive definitions given as necessary and sufficient conditions - philosophers ignore the complexity of the concepts or properties they are used to express. Natural language sometimes reflects this complexity; at other times, it obscures it.

Aristotle investigates linguistic phenomena primarily in the *Categories* and *De Interpretatione*, but also in the *Metaphysics*, the *Topics*, the *Sophistical Refutations*, and the *Prior* and *Posterior Analytics*. He does not always explicitly connect these investigations, but there are several bridge passages that indicate how he takes his views in these areas to be related. Perhaps the single most important such passage opens the *De Interpretatione*, where Aristotle draws a fairly complete analogy between words and sentences on the one hand and types of affections

(*pathēmata*) in the soul on the other.

According to this analogy, there is a reasonably straightforward relation between thoughts and spoken sounds: individual words are to assertoric sentences as individual thoughts are to compound thoughts. The first members of these pairs are without truth value, being in some sense semantically atomic. The second members are by contrast necessarily either true or false. That is, Aristotle claims that bivalence obtains for all simple assertoric sentences and their mental analogues, compound thoughts.

Partly in virtue of this analogy, the opening of the *De Interpetatione* contains the seeds of four related Aristotelian semantic theses, each of which is developed in various places in the corpus:

(1) *Compositionality.* The semantic value of assertoric sentences is a function of their sub-sentential semantically relevant parts (semantically relevant, because, as he points out *De Interpretatione* 16a20-22), neither 'ton' nor 'dent' contributes anything to the meaning of 'Clinton was unusually well educated for an American president.');
(2) *Conventionality.* The written and spoken symbols used to stand for thoughts are conventional, whereas the thoughts themselves and that for which they stand are not;
(3) *Relationalism.* Conventional semantic units (written marks and spoken sounds) receive their semantic significance from those things of which they are symbols;
(4) *Signification.* The relationship in virtue of which they receive their semantic significance consists in or involves what Aristotle calls signification (*sēmainein*).

Of these, (2) and (4) merit special attention.

The second thesis, conventionalism, indicates where Aristotle stands on the question explored in the *Cratylus*. He explicates his contention thus:

> I say <a name is a significant sound> according to convention (*kata sunthēkēn*) because no name is by nature <significant>, but only when it has become a symbol. Even though inarticulate noises, e.g. those belonging to wild beasts, do reveal something (*dēlousi ti*), none of them is a name.
>
> (*De Interpretatione* 16a26-29)

He rejects naturalism, but without endorsing any simple version of conventionalism. Instead, he lays down the constraint that a sound becomes a name only when it has become a symbol, where something is a symbol only when it stands in an appropriate relation to a non-conventional mental representation.

With respect to Aristotle's approach to language and meaning, the fourth thesis, regarding signification (*sēmainein*), is easily the most central and important. It is also the most complex and difficult. Aristotle often writes as if signification were a simple meaning-relation: words signify things, even when they lack referents. Thus, for example, after distinguishing sharply between assertoric expressions, which alone have truth-value, and their constituents, which are not yet truth-evaluable, he imagines someone objecting that the word 'goatstag' (*tragelaphos*) is already false, since there are no such creatures. He responds that although 'goatstag' signifies something, it is not yet true or false, precisely because it is not yet part of an assertoric sentence (*De Interpretatione* 16a16-18). Aristotle's response correctly drives a wedge between vacuous reference and falsity; it also seems to treat signification as closely akin to sense expression: 'goatstag' has sense, but lacks reference (see Sense and reference).

Still, a complication arises for two related reasons:

(1) Aristotle sometimes appeals to signification where it seems unlikely that it can be understood in terms of sense expression;
(2) Aristotle sometimes denies signification to vacuous singular terms.

In the first case, Aristotle surely maintains that not only words signify: the word 'man' signifies rational animal, but the entity man signifies rational animal as well (*Categories* 3b10-23; *Topics* 122b16-17, 142b27-29; *Posterior Analytics* 85b18-21; *Metaphysics* 1017a22-27, 1028a10-16); further, clouds signify rain and smoke signifies fire (*Posterior Analytics* 70a10-38).

Elsewhere, he denies that a single word made to mean 'manandhorse' has signification (*De Interpretatione*

18a19-27). The probable resolution is that the signification relation is for Aristotle in some contexts semantic and in some contexts not; further, in some contexts, signification is more akin to reference and in others more akin to sense expression. In some more technical contexts, Aristotle introduces signification as a sort of essence-specification: man signifies rational animal because humans are essentially rational. Perhaps in this sense, though, 'signification' behaves all the more like the English word 'meaning': smoke means fire; 'ghoul' means 'a spirit that robs graves and devours the corpses'; and we say that although he speaks of piety, Euthyphro does not even know the meaning of the term. In some philosophical contexts, we are appropriately technical about how we understand the concept of meaning; in some other contexts, we are comparatively relaxed. This practice mirrors Aristotle's treatment of signification (see Semiotics).

4 The Stoics and other Hellenistic movements

The Hellenistic schools which flourished after the death of Aristotle became increasingly technical and specialized in their treatments of language. This is especially true of the Stoics, whose interests in logic, grammar and syntax led them to offer deeply subtle theories replete with technical vocabularies capable of an unprecedented richness and precision. The most intricate and important innovations were most likely introduced by Chrysippus.

It is difficult to recapitulate elements of the Stoic system briefly. To begin, the evidence is fragmentary, deriving from many different sources, some of them hostile and most of them secondhand. Moreover, there is a fair amount of divergence within the Stoic camp itself; it is worth remembering that we are dealing with the data of several centuries of philosophy. That said, the doxographer Diogenes Laertius provides a serviceable overview of the main features of Stoic semantic theory:

> Utterance (*phōnē*) and speech (*lexis*) differ, because while vocal sound is also an utterance only articulate sound is speech (*lexis*). And speech differs from language (*logos*), because language is always significant (*sēmantikos*) whereas speech <can> also lack significance, for example, 'blityri'; language can in no way <lack significance>. Moreover, saying (*to legein*) differs from voicing (*to propheresthai*). For while utterances are voiced, what is said are states of affairs - which turn out to be things said (or things which can be said, *lekta*).
>
> (Diogenes Laertius 7.57)

The initial view here is straightforward. Animals, including humans, make noises; but only some of these noises are meaningful. Those noises which express *lekta* are meaningful, or *sēmantikos*, and those which do not are mere sounds. If I speak German and you do not, the utterance '*verkehrt*' will be meaningful for me, but not for you; but even if we both speak German, the nonsense utterance 'blityri' will be meaningless for us both. The Stoics suggest, then, because some noises are significant and others are not, we must suppose that some noises have meanings, namely express *lekta*, while others do not. Hence, it is necessary to postulate the existence of *lekta*.

The primary motivation for the introduction of *lekta* is, then, semantic. For better or worse, with the Stoics we have the first self-conscious reification of meanings as such. Unsurprisingly, the Stoics were quick to exploit a second semantic function of *lekta*. Some *lekta*, called by the Stoics *axiōmata*, are the principal bearers of truth and falsity. According to the Stoics, then, one species of *axiōmata* can be true or false, evidently in a primary way. Our speaking truly or falsely, that is our uttering sentences with truth values, depends upon our uttering a sentence which expresses a complex of meanings, an *axiōma*. Hence, the sentence 'Dion is walking' is true just in case it expresses the proposition, held by the Stoics to be noncorporeal, *that Dion is walking* and that proposition is true. Just as words are correlated with meanings or significates, which the Stoics regard as incomplete *lekta*, so the complete sentence 'Dion is walking' gains its meaning and truth-evaluability by expressing the complete *lekton*, the *axiōma* or proposition which is true independent of its being expressed. Just how determinate Stoic thinking about propositions is remains disputed, since some reports have the Stoics introducing propositions which change truth-values and which, though noncorporeal, can perish, or go out of existence. Often enough, though, in these cases the Stoics turn out to be grappling with quite subtle problems generated by indexicals and demonstratives. Indeed, they often show more sensitivity to these problems than their critics and later expositors display when discussing their views (see Stoicism §8).

The Stoics are by no means alone in offering important advances in thought about language during the Hellenistic period. Sextus Empiricus certainly develops semantic themes. Additionally, the Epicureans, and to a lesser extent the Academics, offer treatments of meaning and language understanding, often reverting to earlier debates about

natural versus conventional signification. Later, the eclectic physician and philosopher Galen (AD 129-*c*.210) returns to the naturalism-conventionalism debate, ridiculing the naturalist propensity for etymology as 'fine friend' which is also an 'impostor'. No other Hellenistic school rivals the Stoics, however, in their genuinely innovative and impressively technical handling of semantic and syntactic matters.

Language, conventionality of

When we say that smoke means fire or that those spots mean measles, we are noting how the presence of one thing indicates the presence of another. For these natural relationships to continue, it is enough that the laws of nature remain the same. The connection between the two states is strictly causal. By contrast when we say, 'In English, "gold" means this stuff', pointing at some metal, we are insisting on an arbitrary connection between a piece of language and part of the world. We might have used another word, as other languages do, or have used this word for something else. But, for a word to have the literal meaning it does in a language, this arbitrary connection must be sustained on subsequent occasions of use. What is needed to sustain the connection is an intention on our part, not just the continued operation of natural laws.

Of course, some connections between words and things are based on natural relations; there is, for example, onomatopoeia. However, few words have this feature. For the majority of words it is quite arbitrary that they have the meanings they do, and this has led many to suppose that the regularities needed to sustain the connections between words and what they stand for are conventional rather than causal. But there are also those who deny that convention is an essential feature of language.

1 Language as governed by conventions

Words do not have intrinsic meanings. They mean what they do because speakers have given them this meaning (see Meaning and communication). But how do they do this? At first we might focus on what a speaker means by their use of words on a given occasion. This may be fixed by their communicative intentions. But for words to have a literal meaning in a public language they must have the same meaning from one occasion to the next, and many have supposed that this can be established only by conventional practice. Conventions, it is claimed, establish the regularities that give words the meanings they have for groups of speakers. So while a speaker may succeed in communicating something by their utterance of an expression on a given occasion, its literal meaning among a population of speakers is what it is conventionally used to communicate on each occasion of use.

Among those who think the appeal to conventions is essential in the study of language, there is room for disagreement about the precise explanatory role they play. Conventions are arbitrary practices that can be defined nonlinguistically; and for some this provides a reason to think they can serve in an analysis of the concept of literal meaning. The analysis proceeds in two stages. If we can explain how a speaker succeeds in meaning something by their use of words on a particular occasion then we can try to explain how this is established as the conventional meaning of those words in the common language of a given population.

An example of this programme is provided by Stephen Schiffer (1972). Schiffer begins with Grice's analysis of speaker-meaning in terms of the speaker's beliefs and intentions to explain what an expression means on a single occasion of use (see Grice, H.P.; Communication and intention). He then argues that we must appeal to conventions to show how speaker-meaning can give rise to the regular and literal meaning of expressions in a public language. A sequence of sounds or marks will have the literal meaning it does among a group of speakers when there is a convention to use those sounds or marks with a particular speaker-meaning. It will no longer be necessary to work out the speaker's meaning each time; the prevailing conventions among a population of speakers will make certain sounds and marks meaningful to them but not necessarily to others, and languages will be patterns of conventional regularities sustained by the practices of particular groups.

A different explanatory role for conventions is proposed by David Lewis (1975). Conventions governing use do not constitute language or determine meaning but they do establish which language is the actual language used by a population. For Lewis, *languages* are well-defined abstract objects - sets of expression-meaning pairs - which exist independently of speakers. We can characterize a language as a function which maps strings of signs to meanings. Among populations of humans there will exist conventions of *language* (in a second and more general sense of the term). These will be regularities in verbal behaviour depending on the beliefs and actions of people in those populations. These conventional regularities determine which of these abstract objects is the actual language used by that population. A population of speakers can be said to use a given language *L* just in case the meaning an expression has in *L* is the meaning it is conventionally taken to have in that population. The account is not reductive, however, for it assumes that speakers already know the meaning of sentences in a given language and

choose to conform to these. But it does offer an analysis of the conventions needed for members of a population to speak the same language. This goes via Lewis' general analysis of conventions which runs as follows.

A regularity *R* is a convention in a population *P* if and only if:

(1) Everyone in *P* conforms to *R*.
(2) Everyone in *P* believes the others are conforming to *R*.
(3) The belief that the others are conforming to *R* gives each person in *P* a good reason to conform to *R*.
(4) People in *P* prefer general conformity to *R* to less than general conformity to it.
(5) *R* is not the only regularity it would be possible for everyone in *P* to conform to.
(6) Conditions (1) to (5) are mutually known to members of *P*.

On this model it is in our common interest to conform to the regularities and abide by the conventions of using a given language. This facilitates cooperation and secures communication. We can coordinate our activities by communicating reliable information to one another by using the same words. This gives us a motive for wanting the regularities to be upheld.

The actual language relation is specified as follows. For a language *L* to be the actual language used in *P* is for there to be a convention of truthfulness and trust in *L*; that is, a convention of using particular sentences in *L* to make statements only if members of *P* believe them to be true, and to take statements other people make in *L* to be a basis for forming beliefs about what is true. To do this speakers must use sentences in accordance with their meanings in *L* just so long as other members of *P* do so. In this way Lewis seeks to reconcile the formal study of languages with activities of particular populations of human language-users.

Followers of Wittgenstein would reject both of the above accounts, criticizing as mysterious the idea of conventions correlating expressions with meanings *qua* entities, and rejecting the idea that meaning in a speech community can be explained in terms of a prior account of what individuals mean by their words on particular occasions. Once we accept that the meaning of expressions is determined by communal use, no appeal to Platonic entities is necessary. But since the rules that govern linguistic practice are determined by the community as a whole, an individual's understanding of language must be parasitic on communal practice. In contrast to the attempted reduction of literal meaning to conventions and speaker-meaning, an individual can only use language meaningfully when participating in the shared practices of a linguistic community. Thus Michael Dummett (1991) thinks that in using words individual language-users must hold themselves responsible to the standards of use of the language to which those words belong. On this view, a language is constituted by the conventional practices and agreed standards of usage. In addition, Dummett believes there are overarching conventions governing the overall aim of language-users to aim at the truth, as well as conventions governing the force (for example, assertoric, interrogative, imperative, and so on) with which they make their utterances.

Dummett offers an argument for the view that language must be governed by communal conventions. It concerns use of terms where we rely on experts to determine their precise meaning. The claim is that I can use the words 'fullback' or 'leveraged buyout' meaningfully while knowing little about football or finance because I rely on there being others who can use these words with greater precision. This is the phenomenon Hilary Putnam (1975) calls the division of linguistic labour (see PUTNAM, H. §3). It depends on a speaker making use of a word that has both an everyday and a more technical meaning, deferring to experts to fix the precise application of the term. However, this feature of language, although pervasive, is not essential to the existence of meaningful speech and we could get by without it. It does not show that there must be conventions of use among, or deference to, a set of experts for me to use words meaningfully.

2 Problems with convention-based accounts

In a revision to his earlier thinking, Schiffer (1987) argues that the reductive analysis of literal meaning is unlikely to succeed since every account of the notion of speaker-meaning we have devised fails. He makes powerful criticisms of Lewis' account of the actual language relation. Speakers can understand sentences of their language they have never heard before: there are potentially infinitely many of these. Clearly, there are no conventions governing the 'still to be used' part of a language. So unless the part we use fixes the unused part there will be nothing to determine which language is the actual language of a group of speakers. It is implausible that speakers

know a function which maps an infinity of sentences onto meanings. But perhaps what they know about the conventionally governed part of the language provides the resources to use and understand the rest. This would require a convention-based account of the expression-meaning of subsentential items, and the rules for their combination. Yet it is equally unlikely that speakers knowingly subscribe to conventions governing each word and grammatical construction ever used. A more plausible suggestion is that speakers have internalised a grammar of the language and this provides the semantic and syntactic resources to comprehend any sentence belonging to it. If this is correct, then why should we think it is conventions rather than psychological mechanisms that relate speakers to their languages? Schiffer argues that just as many difficulties confront us in attempting to relate speakers to grammars as to particular languages.

3 Language without conventions

Objections in principle have been raised to the idea that conventions have an essential role to play in the analysis of language. Donald Davidson and Noam Chomsky have both denied that language requires the existence of conventions. Davidson (1986) rejects the idea that conventions are necessary for linguistic competence. Chomsky (*1986*) rejects the idea that they are sufficient. For Davidson, Lewis-style conventions are too restrictive to explain successful communication. For Chomsky, they are insufficiently systematic to explain a speaker’s knowledge of language. (This was the basis of the criticism in §2.)

Both Chomsky and Davidson have opposed the idea of language as a social practice bound by a shared set of rules or conventions. Instead they argue that the fundamental notion of language is that of an individual’s language, or idiolect. For Chomsky, language has no existence outside the mind of the individual language-user. It is a body of knowledge represented in the mind/brain of the speaker. Davidson, on the other hand, views language as necessarily social, requiring the existence of others with whom we communicate. Despite their differences, neither accepts that we need to share a language in order to communicate.

For Davidson, meaning something by one’s words depends on one’s intention to be understood in a particular way and whether one succeeds. What we mean depends on what we can be understood to mean. This is possible even when speaker and hearer do not share the same meaning for a word, as the case of malapropism makes clear. Davidson goes further in conjecturing that there is no reason in principle why speakers who understand each other have to share any aspects of their language. What they would rely upon instead are general principles for interpreting one another’s behaviour: principles for ascribing meanings to each other’s words, so as to make rational sense of someone’s utterance given the beliefs and desires that best explain that person’s behaviour. This is not to deny that there are conventional aspects to language use, or that in actual speech situations people will make use of similar syntactic devices and enjoy overlapping vocabularies. But none of this is essential for communication. Even where conventions do exist in a language, it is possible to depart from them and still be understood. How far we can depart cannot be determined in advance nor settled by another set of conventions. Thus, Davidson argues, we need neither appeal to conventions nor stick to them to be understood, so they cannot play an essential role in linguistic understanding.

Chomsky agrees with Davidson that for a speaker and hearer to understand one another they do not need to agree on the meaning of words or abide by shared conventions. He departs from Davidson in rejecting the idea that success in communication is a condition of significant language use. Communication is never guaranteed and it does not enter into the conditions for something’s being a language. For Chomsky, language is determined by the cognitive psychological facts internal to the speaker’s language faculty. No two speakers will share the same idiolect; each will have their own internalized grammar and lexicon. If anything is shared it is the initial state of the language faculty characterized by the principles of universal grammar. For Chomsky, universal grammar, which comprises a set of structural principles true of all human languages, is a genetic endowment (see Language, innateness of). Speakers have no conscious or explicit knowledge of it, so cannot choose to conform to it. Nor, if Chomsky is right, is there any alternative to relying on it. Its operation cannot count, therefore, as a convention of language according to Lewis’ definition. For Chomsky it is universal grammar, and not the existence of conventions, that explains the possibility of human languages.

Whether one accepts Chomsky’s view of languages, his empirical findings point to difficulties for Lewis’ proposal. For if no two speakers ever share the very same vocabulary items or observe exactly the same rules of grammar there will be no formally precise, syntactic and semantic characterization of the language spoken by a

given community. On the other hand, what the regularity account of conventions correctly stresses is the social and public aspect of linguistic use and meaning, although in insisting on shared practices, or conformity to communal standards, it goes beyond what is necessary to ensure these. Davidson’s arguments show that meanings can be established publicly without having to be conventional. Conventions of language may abound but they have not been shown to play an essential role in language.

Language, early modern philosophy of

Philosophical interest in language during the seventeenth and eighteenth centuries was strong but largely derivative. Most thinkers shared Leibniz's view 'that languages are the best mirror of the human mind, and that a precise analysis of the significations of words would tell us more than anything else about the operations of the understanding'.

The three most important areas of philosophical discussion about language in the modern period were the nature of signification, the origin of human language and the possibility of animal language. Signification was generally viewed as a relation between linguistic signs and ideas. There was no agreement whether signification is entirely conventional or contains a natural element, but the view is that it is entirely natural virtually disappeared. Even those who retained the belief in the possibility of a philosophically perfect language insisted that such a language should be constructed anew, rather than rediscovered as the lost language of Adam. The traditional biblical account of the origin of language was more and more contested but, as more naturalistic theories emerged, the problem of why other animals cannot talk became especially pressing.

Debates about language in the seventeenth and eighteenth centuries were highly speculative; participants in these debates often relied on simplistic biological theories, inadequate grammars or anecdotal evidence from travellers. What makes these discussions important is less their scientific contribution than their engagement with the philosophical problems concerning the relationship between the human mind and the natural world.

1 The biblical and Lucretian accounts

Two classical accounts provided the intellectual background for modern philosophical debates about language. The first is the biblical story according to which the original names of beasts and birds were given by Adam. Renaissance speculation contends that these names were inspired by God, bore a natural relation to the creatures, and captured their essences. After the confusion at Babel, Adam's universal language was scattered into mutually unintelligible forms of speech, each of which began to decay. The second influential ancient story comes from Lucretius' *On the Nature of Things* (V.1028-90). According to Lucretius, language is an institution created by a community of humans, rather than a single name-giver. People came to form articulate sounds out of a need to coordinate their actions. At the beginning, the ability to communicate by words differed little from children's ability to indicate the object they desire by means of gestures, or animals' ability to indicate fear or pain by cries. As language developed, its structure became more complicated and its uses more diverse.

Perhaps the most criticized point of the biblical account is the claim that language originates with the naming act of a single person. Ideas from Hobbes' *Leviathan* (1651), Locke's *Second Treatise on Government* (1690) and Rousseau's *Du contrat social (The Social Contract)* (1762) provide the paradigm of how a social account of the origin of language might be framed. According to the contractarian view, social norms - whether they are laws of property or laws of meaning - are the result of explicit or tacit agreements among human beings. There is a striking parallel between Locke's criticism of the natural origin of the title to sovereignty in the *First Treatise on Government* (1690) and his opposition to the natural foundation of categorization in the *An Essay Concerning Human Understanding* (1689). Who is to be the heir is not to be decided through the study of the line of inheritance from Adam; what is to be gold is not to be decided through the study of how the word 'gold' descended from the original naming act of Adam. It is rationally grounded convention that settles these matters. Philosophers of the Enlightenment followed Locke's analysis and brushed away the biblical account. Condillac, Rousseau and Herder argued that even if language happens to be a divine creation, human beings had to reinvent it after the Flood or after they scattered over large uninhabited areas, leaving the biblical story at best irrelevant.

The most controversial point of the Lucretian account is the claim that the difference between the primitive signalling of animals and human languages is only a matter of degree. Descartes argued that the ability to understand an unlimited variety of expressions is distinctive of a mind, something that the smartest animal could never do, but which is no challenge for even the dullest human being. This shows 'not merely that beasts have less reason than men, but that they have no reason at all' (Descartes 1637: 58). In his objections, Gassendi protested against this conclusion, and insisted that animals do in fact speak. The Cartesian response - analysing animal signalling and the bodily aspects of human communication in physiological terms - was accomplished in great

detail by Géraud de Cordemoy. The conclusion was that since such an analysis provides a full account of animal signalling, but not of human language, the latter but not the former presupposes a mind (see Animal language and thought).

2 Empiricism: Hobbes

Although not primarily concerned with philosophy of language, Thomas Hobbes presented an influential and distinctively empiricist account of language in Chapter 4 of *Leviathan* (1651) and Part 1 of his *De corpore (On the Body)* (1655).

According to Hobbes, the purpose of speech is to 'transferre our Mentall Discourse, into Verbal; or the Trayne of our Thoughts, into a Trayne of Words' (1651: I.4). There are two reasons we make such a transfer: to record our thoughts for ourselves, and to communicate our thoughts to others. Words employed as mnemonic devices are *notae* (marks); words employed as means of communication are *signa* (signs) (1655: II.1-2). Hobbes holds that the first use of words is primary: if a person were alone in the world, he could create a private language and use words as marks, but not as signs ((1655: II.3).

Hobbes' philosophy of language has two main parts. The first is the account of the relationship between words and what they stand for, or the theory of *names* 1655: II); the second is the account of the connections names bear to each other, or the theory of *propositions* (1655: III).

Names signify conventionally: Hobbes thinks that even if the original names of animals come from God himself, he nevertheless chose those names arbitrarily (1655: II.4). What a name signifies is a *cogitatio* (thought), for the claim that a word like 'stone' is a sign for stones can only be understood as saying that 'he that hears it collects that he that pronounces it thinks of a stone' (1655: II.5). (Nonetheless, Hobbes often speaks of names as signifying things without the mind.) Hobbes is committed to the empiricist thesis that all human thinking is based on imagination. Since imagination itself is nothing but decaying sense, we cannot meaningfully speak of things that cannot be thought of as combinations of sensory images we had previously. Hence, for example, we cannot think of actual infinity: saying that something is infinite means merely that we are 'not able to conceive the ends, and bounds of the thing named' (1651: III.12).

Hobbes' semantics is purely nominalistic (see NOMINALISM §3). General terms do not pick out properties, but signify disjointedly every individual to which they apply (1655: II.9). In a proposition, both terms 'raise in our mind the thought of one and the same thing', and the copula 'makes us think of the cause for which those names were imposed on that thing' (1655: III.3). The proposition '*man is a living creature* raises but one idea in us, though in that idea we consider that first, for which he is called man, and next that, for which he is called living creature' (1655: V.9).

Conventionalism about signification and nominalism in semantics prepare the ground for conventionalism about truth. Truth is ascribed only to propositions, and it consists in the fact that the predicate is a name of everything that the subject is a name of. According to Hobbes, 'the first truths were arbitrarily made by those that first of all imposed names upon things, or received them from the imposition of others. For it is true (for example) that man is a living creature, but it is for this reason, that it pleased men to impose both those names on the same thing' (1655: III.8). It is controversial whether Hobbes consistently adhered to this radical view (see Hobbes, T. §3).

3 Rationalism: Port-Royal

Grammaire générale et raisonnée (General and Rational Grammar: The Port-Royal Grammar) (1660) and *La logique ou l'art de penser (Logic or the Art of Thinking)* (1662) articulate a rationalist conception of language sharply opposed to Hobbes' empiricism. Following Descartes, Arnauld and his collaborators (Claude Lancelot in *Grammar* and Pierre Nicole in *Logic*) reject not only empiricism, but conventionalism and nominalism as well.

The empiricist claim that all our thoughts originate in perception leaves unexplained how we attain ideas like those of being and thinking. Since - the authors of *Logic* insist - we do have such ideas, it follows that 'the soul has the faculty to form them from itself, although often it is prompted to do so by something striking the senses' (1662: I.1). The element of truth in conventionalism is that the association between a word and an idea is arbitrary. However, since the connections among ideas and between ideas and things are natural, we reason not about words

but ‘about the nature of things by considering ideas of the mind that people chose to mark by certain names’ (1662: I.1). Finally, while nominalists are right to claim that all existent things are singular, some entities are not things, but rather modes of things. Modes exist only in virtue of being instantiated in things, but they can be thought of independently of the things in which they inhere 1662: I.2, I.6, II.1).

The semantic terminology of *Grammar* and *Logic* is often loose. The authors talk about words signifying (*signifier*), expressing (*exprimer*) or marking (*marquer*) both things and ideas. (The relationship between ideas and things, however, is consistently called *représentation* (representation).) The principal meaning (*signification principale*) of a word or a sentence is the idea or proposition it expresses, but in order to capture its full meaning connotations must also be taken into account. These connotations are called *auxiliary ideas* (*idées accessoires*). For example, the principal meaning of the sentence ‘You are lying’ is simply ‘You know that the contrary of what you say is true’, but in addition to the principal meaning, these words also convey the idea of contempt (1662: I.14).

The principal meaning of a word can often be presented by an explicit definition. Following Aristotle’s distinction and scholastic terminology, Arnauld and Nicole distinguish between *nominal definition* and *real definition* (1662: I.12). A nominal definition captures a connection between a word and an idea; a real definition captures a connection between ideas, which in turn corresponds to a connection between real entities. Therefore, nominal definitions - at least in their purest form - are arbitrary and are not subject to rational criticism. On the other hand, real definitions in their purest form ‘do not depend on us at all, but on what is contained in the true idea of a thing’ (1662: II.16). But there are impure definitions as well. *Lexical* definitions are intended to capture the ordinary meaning of the word and are consequently discovered and not stipulated by lexicographers (1662: I.14). As lexical definitions are atypical nominal definitions, *descriptions* are atypical real definitions. Descriptions list a number of accidents which are sufficient to specify the extension of an idea, but not the common nature of things within the extension (1662: II.16).

According to Arnauld and Lancelot there are two major categories of words: those that signify the objects of thoughts and those that signify the manner of thoughts (1660: II.1, II.13). The most important subcategory within the first is that of nouns; within the second, verbs. Concrete substantival nouns (such as ‘sun’) signify substances, abstract substantival nouns (such as ‘whiteness’) signify modes (1662: II.1). An adjectival noun has two significata: ‘white’ signifies distinctly the mode of whiteness, and confusedly signifies white things. A verb is a word whose principal function is to indicate assertion, and the copulative verb ‘to be’ has only this principal function (1660: II.13). Other verbs also have a secondary role: they express ideas and thereby refer to entities, and they indicate the time with respect to which the assertion is made. For instance, the verb ‘lives’ in the sentence ‘Peter lives’ expresses the mode of being alive and indicates the assertion that this mode belongs to Peter at the time of the assertion (1660: II.13).

The mind judges by uniting or separating two ideas. The product of judging is a proposition. Propositions are *simple* if they have a single subject and a single predicate, and *compound* otherwise. Compound propositions include among others conjunctions, disjunctions and conditionals. Not all complexity in the subject or predicate terms indicates that the proposition is compound. For example, ‘The invisible God has created the visible world’ - or equivalently, ‘God who is invisible created the world which is visible’ - is a *simple but complex* proposition. For although it contains three propositions - ‘God is invisible’, ‘God created the world’ and ‘The world is visible’ - only the second of these is asserted, while the others are assumed or taken for granted ((1662: II.5; 1660: II.9). By contrast, the proposition ‘God is invisible and he created the visible world’ is compound, since it ascribes two different predicates to the same subject (see Arnauld, A.; Port-Royal).

4 Locke’s *Essay*

Although remaining firmly in the empiricist tradition, John Locke’s *An Essay Concerning Human Understanding* (1689) incorporates some of the insights of Cartesian rationalism. This synthesis makes the *Essay* the essential point of reference for all philosophy of language in the eighteenth century.

According to Locke, the primary purpose of language is communication. God or nature made our organs fit to produce articulate sounds, and through arbitrary imposition we are capable of making these sounds ‘Signs of internal Conceptions’ (Locke 1689: III.i.2; see also III.ii.1). At first glance, this view resembles Hobbes’, but - as

Leibniz remarks at the beginning of Book III of his *Nouveaux essais sur l'entendement humain (New Essays on Human Understanding)* (posthumously published in 1765) - there is an important difference: for Hobbes the private use of words is fundamental, whereas for Locke it is their use as signs for others.

The main thesis of Locke's theory of signification is that 'Words in their primary or immediate signification, stand for nothing, but the Ideas in the Mind of him that uses them' (1689: III.ii.2). Since the purpose of words is to invoke in the hearer's mind an idea identical (or at least sufficiently similar) to the idea the speaker has in mind, a word is bound to be intimately connected to an idea of the speaker. To say that primary signification is nothing but the speaker's idea does not mean that the word refers to that idea, or that in using a certain word the speaker is talking about the idea his word primarily signifies. Besides the primary signification of words, men often 'in their Thoughts give them a secret reference to two other things': the ideas in the minds of other speakers, and the reality of things (1689: III.ii.4). This supposition of *secondary signification* is indispensable for human beings, since 'without this double Conformity of their Ideas, they find, they should both think amiss of Things in themselves, and talk of them unintelligibly to others' (1689: II.xxxii.8). Locke apparently condemns only the assumption that words can directly signify the ideas of others and the reality of extramental things, without the mediation of their primary signification.

In accordance with the Cartesian tradition, Locke emphasizes that a genuine language cannot contain only singular names. We need signs which stand for more than one thing, since without these there would be too many (perhaps infinitely many) words to learn 1689: III.i.3; III.iii.2-4). With regard to the signification of these general terms Locke was a conventionalist. His primary target is the doctrine that general terms signify substantial forms, genuine universals in the things themselves that provide the ground for an objective classification of things. Since, he argues, our ideas are made up exclusively from the materials provided by experience (1689: II.xii.1), and since we cannot form ideas of substantial forms in this manner (1689: III.vi.10), substantial forms cannot be the significata of general words. The general term 'horse' signifies the *abstract general idea* of a horse, an idea that represents actual horses in virtue of representing certain sensible qualities they have in common. According to Locke, when we categorize things, we use the significata of our general terms. Fixing the significata of these terms is not a matter of discovering determinate species that exist independently of us, but rather a matter of reasonable choice from among the innumerable objective similarities of things (1689: III.iii.13).

In the case of ideas of substance, which represent natural unions of qualities, our forming of the appropriate abstract idea is independent of our linguistic abilities. The case is more complicated in the case of ideas of mixed modes, which represent collections of qualities that are not necessarily united in the same subject. For such complex ideas, although it is 'the Mind that makes the Collection, 'tis the Name which is, as it were the Knot, that ties them fast together' (1689: III.v.10). In the case of simple modes, like those of number, the dependence on naming is even more explicit: according to Locke, we could not have ideas of large numbers for which we have no names (1689: II.xvi.5).

Locke subscribes to the Port-Royal view that syncategorematic words - terms like 'is' and 'but', which he calls *particles* - stand not for ideas but for operations of the mind by which the ideas signified by other words are put together into a proposition. The truth of a proposition consists in the 'joining or separating of Signs, as the Things signified by them, do agree or disagree with one another' (1689: IV.v.2). Whether for Locke truth consists always in agreement and disagreement between ideas, or whether he allows for agreement and disagreement between an idea and what it represents, is a controversial question of Locke interpretation (see LOCKE, J. §§3-5).

5 Critique of Locke: Berkeley and Leibniz

The main tenets of Lockean philosophy of language were widely accepted among philosophers in the eighteenth century, but they did not remain unchallenged. The most important objections to the Lockean theory were made by George Berkeley and Gottfried Wilhelm Leibniz. Berkeley's critique was sketched in his *Philosophical Commentaries* (written between 1707 and 1708), and elaborated in *A Treatise Concerning the Principles of Human Knowledge* (1710), and his dialogue *Alciphron* (1732). Leibniz's objections take the form of a line-by-line critical commentary in his *New Essays on Human Understanding* (1765).

Berkeley's critique focuses on three major areas: the purpose of language, the semantics of general terms, and the nature of signification. He denies that communication is the chief end of discourse. Besides conveying our

thoughts to others, language is also used in ‘the raising of some passion, the exciting to, or deterring from an action, the putting the mind in some particular disposition’ (Berkeley 1710: Introduction 20). These are direct effects of speech, possibly achieved without the mediation of ideas. Berkeley’s remark concerning the use of the expression ‘good thing’ prefigures later emotivist treatments: the function of such expressions is to excite the appropriate feelings in us (1710: Introduction 20) (see Emotivism). Even expressions that - unlike ‘good thing’ - do signify ideas, can do so in the way the letters of algebra signify, where ‘though a particular quantity be marked by each letter, yet to proceed right it is not requisite that in every step each letter suggest to your thoughts, that particular quantity it was appointed to stand for’ (1710: Introduction 19).

Berkeley harshly criticizes a view he associates with Locke concerning the generality of words and ideas. For Berkeley, a general word stands for a class of particulars by signifying ‘an idea, which considered in itself is particular, [but] becomes general, by being made to represent or stand for all other particular ideas of the same sort’ (1710: Introduction 12). There is no need to assume that a single abstract idea is signified by each general term: by the mechanism of *selective attention* we can consider one or another feature of a particular idea, and then use it as a sign for all particular ideas that share the given feature. Berkeley’s criticism may miss its target. When Locke talks about abstraction, he also uses the language of considering certain features within a particular idea (for example, (Locke 1689: II.xi.9). Still, it remains unclear whether Locke thinks that abstract ideas are made from particulars via selective attention, or whether he in fact agrees with Berkeley that abstract ideas simply are particular ideas considered selectively.

Berkeley rejects the thesis that certain words have a secondary signification without the mind; things without the mind could be either material or immaterial, and Berkeley denies the existence of the former and the imaginability of the latter. Words like ‘horse’ or ‘white’ signify an idea without indicating anything beyond the idea; words like ‘soul’ or ‘God’ signify a substance without the mediation of an idea. A language is a network of signification relations between ideas which obtain in virtue of some customary connection. If the connections are the result of human imposition (for example, associating the idea of the letter ‘a’ with the idea of the corresponding sound, or associating the idea of the word ‘apple’ with some idea of an apple), the system of significations is an *artificial language*. If the connections result from divine imposition (for example, the connection between the ideas of fire and smoke, or between the visual idea of a square and a tactile idea of a square), the system is a *natural language* (Berkeley 1733: 40; see also Berkeley 1709: 140, 147). For Berkeley, the study of nature is the study of grammar for the divine language. Natural phenomena - which, of course, are merely collections of ideas - can signify one another, but they cannot stand in genuine causal relations to one another: it is God’s creating and sustaining act that causes everything to exist and be the way it is (1733: 13; 1710: 65, 108) (see Berkeley, G. §§5-6, 11).

Leibniz’s two main targets in the Lockean theory are claims wholeheartedly endorsed by Berkeley: that signification of words is arbitrary and that categorization is the work of the mind. According to Leibniz, signification is ‘settled by reasons - sometimes natural ones in which chance plays some part, sometimes moral ones which involve choice’ (Leibniz 1765: III.2). To support this thesis, Leibniz presents etymological links connecting contemporary words with earlier forms, and sometimes ultimately with onomatopoeia. What grounds these explanations is the principle of sufficient reason: brute accidents are as unacceptable in semantics as in physics.

Leibniz defends the semantic relevance of real definitions against Locke. Although ‘gold’ can be given a number of different nominal definitions, only a few of these will be in agreement with the genuine conceptual analysis. A real definition is grounded in a real species, and has the characteristic mark that it ‘displays the possibility of the definiendum’ (1765: III.3). Since he rejects the view that ideas we have must be completely transparent to us, he can resist Locke’s claim that our words cannot signify unknown features: ‘the name "gold"… signifies not merely what the speaker knows of gold, e.g. something yellow and very heavy, but also what he does not know, which may be known about gold by someone else, namely: a body endowed with an inner constitution from which flow its color and weight, and which also generates other properties which he acknowledges to be better known by the experts’ (1765: III.11). If pressed, we would have to come up with nominal definitions for substances; but these do not fix the meaning of the corresponding terms, since we recognize that ‘our definitions are all merely provisional’. We know that something that passes all our current tests for being gold may nevertheless fail to be gold, since ‘one might… discover a new assaying method which would provide a way of distinguishing natural gold from this artificial gold’ (1765: III.4, 6).

What underlies this insistence on real definitions is Leibniz's commitment to the ideal of a *universal characteristic*, a written language which could be understood by any rational being and which could perfect human reasoning itself. Corresponding to each complex concept or proposition, there is a complex symbol in the universal characteristic whose structure is the same as the structure of the concept or proposition signified. Occasionally, Leibniz talks about the primitive symbols of the universal characteristic as geometrical figures - like Egyptian hieroglyphs or Chinese characters - which bear some similarity to what they represent Liebniz 1875-90: IV.72-3). He also made attempts to assign numerical values to various concepts and to represent conceptual analysis as analogous to prime factorization (Couturat 1903: 245-6). But - as Leibniz himself realized - our concepts are so complex that we have no reason to believe that the process of resolving them into primitive constituents is a finite one. This does not mean that the system of numerical characteristic is useless. Since logic imposes constraints on possible assignments of numerical values to concepts, and since these constraints are expressible in the form of Diophantine equations, the system of numerical characteristic without the analysis of concepts can be used as a *formal calculus* to check the validity of inferences (1875-90: VII.205) (see Leibniz, G.W. §10).

6 The origin of language: Condillac and Rousseau

Questions about the origin of language were widely discussed in the seventeenth century but the views proposed did not go much beyond the biblical or the Lucretian accounts. This changed radically in 1746 with the publication of Étienne Bonnot de Condillac's *Essai sur l'origine des connaissances humaines (An Essay on the Origin of Human Knowledge)*.

Condillac was an enthusiastic but critical follower of Locke. His disagreement with Locke concerns two issues related to language. Condillac's first criticism is that Locke's theory about the mind is merely descriptive and fails to explain how understanding originates from sensation. The second is that Locke underestimates the role language plays in a theory of ideas. The two points are connected, since the 'the consideration of words, and of our manner of using them, might give some light into the principle of our ideas' and could yield 'a far better explication of the springs of the human understanding' (introduction to Condillac 1746).

Condillac claims that human beings can attain control over their thoughts solely in virtue of the use of *instituted signs*. Animals lack the ability to establish a conventional relation between an object and its sign, they cannot recall ideas at will, and therefore cannot prudently direct their behaviour. Animals are driven by instinct, which is 'no more than the imagination, as independent of our command, though by its activity, completely concurring to the preservation of our being' (1746: I.ii.95). In *Traité des sensations (Treatise on Sensation)* (1754), Condillac imagines a statue gradually brought to life by obtaining its five senses one by one. According to Condillac, the fully sensitized statue will be able to recognize its basic needs, remember things and learn from experience but, because it lacks speech, it will have only 'the habit of directing itself by ideas for which it does not know how to account' (1754: II.viii.35).

But it seems that in order to make use of instituted signs, we must already have sufficient reflection to choose them and to establish the conventional link between the signs and their significata (1746: I.ii.49). This is the problem that Condillac's account of the origin of language is supposed to answer. The explanation begins with natural signs - cries and gestures: these constitute the *language of action* (1746: II.i.1). The development of reflection and the development of language are intertwined: since both require the other, they evolve through a process of bootstrapping. Communicative intentions first arise due to the recognition of the accidental success of the language of action. From that point on, reflection and language interact to the mutual expansion and sophistication of both (see Condillac, É. B. de §§2, 3).

In the years following the appearance of Condillac's *Essay*, Diderot, Maupertuis and Turgot in France, Adam Smith and Lord Monboddo in England, Moses Mendelssohn and Johann Gottfried Herder in Germany each expressed their views on the origin of language. But perhaps the most significant contributions to the debate initiated by Condillac were Jean-Jacques Rousseau's *Discours sur l'origine et les fondements de l'inégalité parmi les hommes (Discourse on the Origin and Foundations of Inequality among Mankind)* (1755) and *Essai sur l'origine des langues (On the Origin of Languages)* (published posthumously in 1781). Rousseau replaces Condillac's relatively harmonious conception of the course of development with his emphasis on the conflict between human nature and social existence. He agrees that languages arise because of human needs, but he rejects the idea that these are physical needs. Physical needs would never have forced us to abandon the language of

gesture (Rousseau 1781: 1). What stimulated the first words were *moral needs*, passions. 'As man's first motives for speaking were of the passions, his first expressions were tropes' (1781: 3). That is, language and art were not separated at the beginning of history. As savage man turned into barbarian man and finally into civilized man, human needs changed, and as a consequence human languages lost their connection to music, becoming more and more rational and less and less passionate (1781: 19). And as societies assumed their final form, where 'no longer is anything changed except by arms and cash', languages have also become less favourable to liberty (1781: 20) (see Rousseau, J.-J. §2).

Language, Indian theories of

*Language is a much debated topic in Indian philosophy. There is a clear concern with it in the Vedic texts, where efforts are made to describe links between earthly and divine reality in terms of etymological links between words. The earliest surviving Sanskrit grammar, Pāṇini's intricate Aṣṭādhyāyī(Eight Chapters), dates from about 350 BC, although arguably the first explicitly philosophical reflections on language that have survived are found in Patañjali's 'Great Commentary' on Pāṇini's work, the Mahābhāṣya (*c.*150 BC). Both these thinkers predate the classical systems of Indian philosophy. This is not true of the great fifth-century grammarian Bhartṛhari, however, who in his Vākyapadīya (Treatise on Sentences and Words) draws on these systems in developing his theory of the* sphoṭa, *a linguistic entity distinct from a word's sounds that Bhartṛhari takes to convey its meaning.*

Among the issues debated by these philosophers (although not exclusively by them, and not exclusively with reference to Sanskrit) were what can be described as (i) the search for minimal meaningful units, and (ii) the ontological status of composite linguistic units. With some approximation, the first of these two issues attracted more attention during the early period of linguistic reflection, whereas the subsequent period emphasized the second one.

1 Historical sketch

Linguistic science in India started soon after the Vedic period. The earliest grammarian whose work has survived is Pāṇini (*c.*350 BC), author of the *Aṣṭādhyāyī(Eight Chapters)*. This work consists of some 4,000 aphoristic statements (*sūtras*) which describe the Sanskrit language in considerable detail, but leave no space for explicit reflections about the nature of language. Such reflections make their appearance in the voluminous *Mahābhāṣya (Great Commentary)* of Patañjali (*c.*150 BC). The *Mahābhāṣya* is a commentary on the *Aṣṭādhyāyī* (but not on all of its *sūtras*), and on the aphoristic *vārttikas* of Kātyāyana, which comment upon Pāṇini's *sūtras*. Another linguist whose work has been preserved and who, like Kātyāyana, appears to belong to the period between Pāṇini and Patañjali, is Yāska, author of the *Nirukta (Etymological Explanation)*.

All these authors precede the formation of the classical systems of Indian philosophy; their reflections on language are therefore largely unaffected by them. This changes with Bhartṛhari (*c.* fifth century), perhaps the first commentator on Patañjali's *Mahābhāṣya*, and the author of the *Vākyapadīya (Treatise on Sentences and Words)*. Bhartṛhari is well aware of the philosophies of his time, and makes ample use of them to construct his own system, which he presents as the philosophy of grammar. The subsequent Pāṇinian tradition accepts this philosophy (or what it preserves of it) as its own, but there are remarkably few grammarians who write treatises on it. Apart from the three principal commentators on the *Vākyapadīya* - Helārāja (tenth century), Puṇyarāja and Vṛṣabhadeva (dates unknown) - by far the most important among them are Kauṇḍa Bhaṭṭa and Nāgeśa Bhaṭṭa, both belonging to the most recent period of grammatical studies (after 1600). Some authors belonging to different schools of thought, however, adopt and defend some of the points of view of the grammarians. The ontological status of composite linguistic units is a subject that evokes special interest.

2 The search for minimal meaningful units

The different linguistic sciences of ancient India - and in particular grammar and etymological explanation - have to be understood against the background of the practice, common in the Vedic Brāhmaṇas (before Pāṇini), of giving etymological explanations of names of gods and of other terms, usually related to the sacrifice and often occurring in sacred formulas (*mantras*). Unlike those of modern linguistics, the etymologies of ancient India have nothing to do with the origin or the history of the words concerned. They cannot, because language, and the Sanskrit language in particular, was looked upon as stable in time; from the subsequent period we know that many even believed Sanskrit to be eternal, that is, without beginning. These etymologies establish links between things and the mythological reality that hides behind them. The god Agni ('fire'), for example, is thus called because he was created first (*agre*). There are countless etymologies of this kind in the Brāhmaṇas. These texts frequently add that the gods have obscured a number of the etymological links. The god Indra, for example, is 'really' called Indha ('the kindler') because he kindled the vital airs. However, people call him Indra because the gods are fond of the cryptic, and dislike the evident. Knowledge of the links revealed by etymologies is important in reaching one's religious goals.

Yāska's *Nirukta* takes the validity of such etymologies for granted, but secularizes their use. It presents etymologizing as a way to arrive at the meaning of unknown words. Moreover, only nouns and adjectives can be etymologically explained, and then only in terms of verbal forms: verbs explain nominal words, and show the (or an) activity that characterizes the object named. Yāska illustrates his method with the help of known words. One might expect that this procedure would lead to the identification and isolation of the common parts found in different words (such as the common part *ag* of *agni* and *agre* in the above example), and would determine their meanings. But Yāska's demands with regard to the semantic adequacy of etymological explanations are so stringent that this turns out to be impossible. He insists, for example, on two different etymological explanations for words that have two meanings. This rigour forces Yāska to be very undemanding with respect to the phonetic similarity required in etymological explanations. With the help of a number of examples from grammar, he shows that phonemes may disappear, be modified, change position, and so on. The same applies, *a fortiori*, to etymology. Similarities between words in etymological explanations may, as a consequence, be minimal: one single phoneme in common may have to do. The main thing is that one should not be discouraged; one should not stop looking for an etymological explanation simply because one does not find similar words.

It is interesting to observe that Patañjali's *Mahābhāṣya* contains a passage which, like Yāska's *Nirukta*, shows how phonemes may undergo change of position, elision and modification in grammatical derivations. Unlike Yāska, Patañjali concludes from this quite explicitly that phonemes by themselves cannot have meaning, although it seems likely that Yāska, even though he does not state it in his *Nirukta*, drew the same conclusion as Patañjali. It appears that Yāska's semantic rigour prevented him from trying to identify the ultimate meaningful constituents of Sanskrit (as we see for ancient Greek in Plato's *Cratylus*, for example). This task, but on a far less ambitious scale, is left to the grammarians, among whom Pāṇini is the most famous. His grammar is not an analysis of Sanskrit but a synthesis: it produces the words and sentences of the language, starting from their ultimate meaning-bearing constituents, essentially stems and affixes. To be precise, Pāṇini's grammar first furnishes stems and affixes on the basis of a semantic input, and these stems and affixes are subsequently joined together, and modified where necessary, so as to yield words and sentences (see Bronkhorst 1980).

In view of the background of Vedic etymologies, discussed above, one may legitimately conclude that Pāṇini considers these ultimate meaningful constituents to be really meaningful, more so perhaps than the 'surface forms' they help produce. The search for 'really meaningful' ultimate constituents of language is clearly present in the efforts of the grammarians. Pāṇini's *sūtra* 1.2.45, which recognizes but three meaningful entities, namely verbal roots, nominal stems and suffixes, indicates that words and sentences are considered to have at best a composite meaning. This search manifests itself later in the attribution by a number of Tantric thinkers of metaphysical meanings to individual phonemes. They can afford to go further than Pāṇini and Yāska in their analysis, continuing all the way to the individual phonemes, owing to the fact that they are less limited by semantic considerations. This in its turn is no doubt linked to the circumstance that sacred formulas (*mantras*) in Tantrism (unlike the Vedic ones) have shed their connection with ordinary language and its semantic constraints.

Returning to Pāṇini and grammatical analysis, later grammarians, mainly under the influence of Patañjali and Bhartṛhari, reject the position according to which the ultimate meaningful constituents presented by grammar are somehow more real than the words they produce. For them, stems and affixes are conventions, or rather inventions of grammarians. This reaction is to be understood in the light of the ontological concerns to be discussed below. The semantic analysis underlying Pāṇini's procedure, on the other hand, came to be generally accepted (albeit sometimes with slight modifications). Later thinkers use this analysis as the basis for deliberations on the relative importance of the various 'semantic elements' that Pāṇini assigns to a sentence in the understanding obtained by a hearer (*śābdabodha*). In a sentence like *caitraḥ pacati* ('Caitra cooks'), to take a simple example, the grammatical elements are: *caitra-s pac-a-ti*. Of these, the following are expressive: *caitra*, *pac* and *ti*. Thinkers of the new Nyāya school (Navya-Nyāya) consider the grammatical subject (in this case *caitra*) most important, and give (approximately) the following semantic analysis of the sentence: 'Caitra characterized by the activity of cooking'. The grammarians look upon the meaning of the verbal root (*pac*) as central, and paraphrase the sentence (again approximately) as: 'The activity of cooking whose agent is Caitra'. The Mīmāṃsakas, finally, put emphasis on the verbal suffix (here *ti*); since they are primarily interested in Vedic injunctions, and consequently in imperative and optative verbal forms, we shall not enter into the details of their analyses.

3 The ontological status of composite linguistic units

To appreciate the importance of the debate on the ontological status of composite linguistic units, one has to be aware of the great interest in ontological questions that characterizes much of Indian philosophy. In the realm of language this leads to questions like: Do words and sentences really exist? If so, how can they, given that the phonemes that constitute them do not occur simultaneously? Since, moreover, simultaneous occurrence is a condition for the existence of collective entities, do individual phonemes exist? They, too, have a certain duration, and consist therefore of parts that do not occur simultaneously.

Perhaps the first to address these questions were Buddhists of the Sarvāstivāda school. These Buddhists were active in the first centuries BC in drawing up lists of elements - the so-called *dharmas* - which were considered to constitute all there is (see Buddhism, Ābhidharmika schools of). The list accepted by the Sarvāstivādins contains three elements which correspond to phonemes (*vyañjanakāyas*), words (*nāmakāya*) and sentences (*padakāya*) respectively. This means that these Buddhists postulated phonemes, words and sentences as existing entities which, like virtually everything else in their ontology, are momentary. Little is known about the way they visualized the mutual relationship between these entities, or how they would answer the questions formulated above.

The grammarian Patañjali may have been influenced by these ideas. He certainly knew the notion of an individual phoneme and of a word conceived of as a single entity. For Patañjali, these phonemes and words are not momentary; they are, on the contrary, eternal. One should not, however, attach too much importance to this difference: for the Buddhists, everything is momentary; for many Brahmans, the Veda, and therefore also its language, is eternal. It is more important to observe that these notions play a relatively minor role in Patañjali's expositions. They acquire major significance in Bhartṛhari's *Vākyapadīya*, where they are made to fit his general philosophy that more comprehensive totalities are more real than their constituent parts.

It appears that in the period between Patañjali and Bhartṛhari a major shift of emphasis took place in the discussion of linguistic units. The discussion became centred on the linguistic unit as meaning-bearer. The problem of individual phonemes, which have no meaning, came to be separated from that of words, grammatical elements (stems and affixes) and sentences, which do. In the context of Bhartṛhari's philosophy this is understandable, for here linguistic units and the 'objects' they refer to are treated in a parallel fashion. But this shift of emphasis was not confined to the grammatical tradition. Śabarasvāmin, the author of the oldest and most important surviving commentary on the *Mīmāṃsāsūtra*, and who may be an approximate contemporary of Bhartṛhari, cites (1.1.5; see Frauwallner 1968: 38-) an earlier commentator who rejects the notion of a word as different from its constituent phonemes. This does not, however, prevent him from proclaiming that phonemes are single and eternal. In other words, phonemes and words undergo a different treatment altogether. Moreover, the author of the *Yogabhāṣya* (whose name was probably Patañjali, like the author of the *Mahābhāṣya*, although he was certainly different from the latter; recent tradition calls him Vyāsa) speaks about the single word which is without parts, without sequence, without constituent phonemes, and which is mental (on *Yogasūtra* 3.17). This Patañjali may have lived around 400 AD, and therefore perhaps before Bhartṛhari.

4 Early *sphoṭa* theory

Patañjali (the grammarian) and Bhartṛhari use the word *sphoṭa* to refer to linguistic entities conceived of as different from the sounds that reveal them. For Patañjali, the *sphoṭa* does not necessarily convey meaning; he uses the term also in connection with individual phonemes. For Bhartṛhari, the *sphoṭa* is a meaning-bearer. The *sphoṭa*, he points out, is different from the sounds which manifest it, and he makes several suggestions as to what constitutes it. It might be a mental entity. Or one might take it to be the universal residing in the manifesting sounds. One could even look upon the material basis of words, for example, wind, as being the *sphoṭa*. Bhartṛhari presents these options, but his perspectivism allows him to avoid choosing between them.

Arguments claiming to prove the existence of the *sphoṭa*, as well as arguments which try to refute it, henceforth concentrate heavily, even exclusively, on the *sphoṭa* as meaning-bearing unit. The primary question is not 'What exactly is the *sphoṭa*?' but rather 'How can a sequence of phonemes, each without meaning and not even occurring simultaneously, express meaning?' According to some, a sequence of sounds can express meaning; they have to show how it does so. Others hold that this is not possible; they solve the problem by postulating the existence of

the *sphoṭa*. These two positions find their classical expositions in Kumārila Bhaṭṭa's critique of the *sphoṭa* doctrine in his *Ślokavārttika (Commentary in Verse)* (seventh century), and in Maṇḍana Miśra's (*c.*700?) defence against these attacks in his *Sphoṭasiddhi (Demonstration of the Sphoṭa)*. Neither Kumārila nor Maṇḍana were grammarians: the former belonged to the school of Vedic hermeneutics called Mīmāṃsā; the latter, too, had links with this school.

Kumārila, elaborating the opinions of Śabarasvāmin (see §3), on whose *Mīmāṃsābhāṣya* he comments, accepts the eternal existence of individual phonemes. But he combats the notion that more than phonemes are required to understand the meaning-bearing function of language. It is true that the phonemes constituting a word are not pronounced simultaneously. But there are situations where everyone agrees that a series of activities that succeed each other in time can none the less jointly produce an effect. He gives the example of a Vedic sacrifice, whose constituent activities are performed at different times, but which produces a single result, namely heaven. Another example concerns counting: we can count objects in sequence, one after the other, and arrive at one result, their number. Furthermore, the fact that individual phonemes are without meaning does not exclude the possibility that they can express a meaning when pronounced in sequence. The parts of a cart, too, cannot fulfil the functions that a cart can fulfil. Last but not least, though the constituent phonemes of a word are not pronounced simultaneously, they are remembered together the moment the last phoneme is (or has just been) uttered.

Maṇḍana answers Kumārila's arguments one by one. He protests against the idea of the combined memory of the phonemes that constitute a word. First of all, one does not remember phonemes, but the word as a whole. Second, memory impressions can only present to us their contents, in this case phonemes, not something else, such as the meaning of the word. And third, two words may consist of the same phonemes, say 'pit' and 'tip' (a Sanskrit example is the pair *saraḥ*/*rasaḥ*, 'lake'/'taste'), so that the memories that combine their phonemes should be the same, yet they are recognized as different. Perhaps Maṇḍana's most interesting contribution to the discussion is his claim that the *sphoṭa* is directly perceived: it is gradually revealed by the phonemes.

The *sphoṭa* constitutes the central element of what came to be called the philosophy of the grammarians. All thinkers who deal with the issue, including Maṇḍana Miśra, refer in this connection to Bhartṛhari's *Vākyapadīya*. But the more encompassing ideas in the context of which Bhartṛhari worked out his ideas on the nature of linguistic entities largely escaped the attention of those who so faithfully cited him.

5 Later *sphoṭa* theory

After a lull, a revival of interest in the *sphoṭa* and related issues took place from the sixteenth century onward. Of the various authors who wrote treatises on the philosophy of grammar, Nāgeśa Bhaṭṭa (*c.*1700) was the most famous. He wrote a large number of treatises on various subjects, among them the *Sphoṭavāda (Exposition on Sphoṭa)*, the *Laghumañjūṣā(Small Casket)* and the *Paramalaghumañjūṣā(Extremely Small Casket)* (written in this order), which deal with the philosophy of grammar. These books show that Nāgeśa changed his mind several times with regard to the *sphoṭa* doctrine.

The *Sphoṭavāda* enumerates eight types of *sphoṭa*: (1) phoneme, (2) word, (3) sentence, (4) indivisible word, (5) indivisible sentence, (6) phoneme-universal, (7) word-universal, (8) sentence-universal. These *sphoṭas* are primarily meaning-bearers. The first and sixth ones, in spite of their misleading names, refer to grammatical elements (stems and affixes) rather than to phonemes. Nāgeśa's reasons for postulating these eight types are not always clear. This early work gives the impression that he collected various ideas without being able to combine them into one overarching vision.

This changes with the *Laghumañjūṣā*, which opens with the words: 'In this [work] the sentence-*sphoṭa* is most important.' Other parts of the work make it clear that Nāgeśa has been converted - no doubt under the influence of Bhartṛhari, whose *Vākyapadīya* he frequently cites - to the idea that only sentences really exist, that words and grammatical elements are no more than imaginary. He is particularly fierce with regard to grammatical stems and affixes.

Surprisingly, the *Paramalaghumañjūṣā,* meant to be an abbreviated version of the *Laghumañjūṣā*, begins, like the *Sphoṭavāda*, with an enumeration of the eight kinds of *sphoṭa*. Immediately following this it repeats the opening statement of the *Laghumañjūṣā*, according to which the sentence-*sphoṭa* is most important. Closer study reveals that Nāgeśa has been confronted with cases where the sentence-*sphoṭa* view comes into conflict with grammatical

derivations. There is a grammatical meta-rule which states that a grammatical derivation evolves in the order in which the expressive elements arise. Expressive elements acquire in this way importance, and it will not do to say that their expressiveness is merely imaginary. The issue is all the more important in view of the fact that there were different opinions as to whether the final substitutes of the grammatical elements - which appear in the 'surface forms' - are expressive, or whether the substituends are. This disagreement can have an effect on the correct derivation of words and sentences. Nāgeśa's final position is chosen in awareness of these complications. He still maintains that the sentence-*sphoṭa* is most important. But he no longer treats the other, 'imaginary', entities as lightly as he did earlier.

Nāgeśa is often thought of as the last great author in the Pāṇinian tradition. His vacillations where the *sphoṭa*-doctrine is concerned illustrate the conflict that exists between the two major issues of grammar distinguished in this entry: the search for minimal meaningful units on the one hand, and the ontological status of composite linguistic units on the other. His final position tries to give both their due: the idea inherited from Bhartṛhari that only the sentence is 'real', rather than words and smaller grammatical elements; and the idea inherited from Pāṇini that grammar is concerned with the smallest identifiable meaningful elements and the way they combine to form larger units.

Language, innateness of

Is there any innate knowledge? What is it to speak and understand a language? These are old questions, but it was the twentieth-century linguist, Noam Chomsky, who forged a connection between them, arguing that mastery of a language is, in part, a matter of knowing its grammar, and that much of our knowledge of grammar is inborn.

Rejecting the empiricism that had dominated Anglo-American philosophy, psychology and linguistics for the first half of this century, Chomsky argued that the task of learning a language is so difficult, and the linguistic evidence available to the learner so meagre, that language acquisition would be impossible unless some of the knowledge eventually attained were innate. He proposed that learners bring to their task knowledge of a 'Universal Grammar', describing structural features common to all natural languages, and that it is this knowledge that enables us to master our native tongues.

Chomsky's position is nativist *because it proposes that the inborn knowledge facilitating learning is* domain-specific. *On an empiricist view, our innate ability to learn from experience (for example, to form associations among ideas) applies equally in any task domain. On the nativist view, by contrast, we are equipped with special-purpose learning strategies, each suited to its own peculiar subject-matter.*

Chomsky's nativism spurred a flurry of interest as theorists leaped to explore its conceptual and empirical implications. As a consequence of his work, language acquisition is today a major focus of cognitive science research.

1 The development of Chomsky's nativism

In a review of Skinner's *Verbal Behavior*, Chomsky ((1959) rejected the behaviourist view that mastery of a language, or 'linguistic competence', consists in complexes of 'dispositions to verbal behaviour' instilled in our minds by 'operant conditioning' during childhood (see Skinner, B.F.; Behaviourism, methodological and scientific). First, children neither need nor receive the careful linguistic training that the behaviourist acquisition-theory requires. Second, our use of language is both *stimulus-independent* (not determined by the inputs we receive) and *productive* (we can utter and understand indefinitely many novel sentences). Hence competence must be more than a congeries of 'verbal habits'. Both language acquisition and linguistic competence involve complex systems of psychological states and processes.

But how to characterize these states and processes? In the early 1960s, Chomsky's 'generative' approach to linguistics challenged the 'taxonomic' approach of American structuralists such as Bloomfield and Harris (see Structuralism in linguistics §4). He urged that linguists abandon the structuralist aim of elucidating 'discovery procedures' (that is, mechanical methods which, when applied to a corpus of sentences in a language, will deliver a grammar descriptive of that language) and focus instead on the development of rigorous, formalizable syntactic theories for particular languages. The linguist's goal should be to develop *generative* grammars for natural languages, that is, sets of rules that will produce all and only the sentences in a language, together with their syntactic-structural descriptions (see Syntax §3).

Much of Chomsky's work in linguistics has aimed at refining the generative programme. Of particular interest here, however, is his contention that a grammar's usefulness outruns its ability to characterize a language. Its real importance, he argued, is psychological. Since speakers' grammatical intuitions (their judgments as to the well-formedness of sentences) constitute the data for a grammatical theory, that theory is in some sense descriptive of what speakers know about their language. Thus, Chomsky inferred, grammars supply (partial) accounts of the psychological structures underpinning language use, so providing a timely replacement for the ousted behaviourist account of linguistic competence. (Chomsky distinguishes theories of linguistic competence from theories of linguistic performance. Competence theories describe our capacity for language in a way that abstracts from the question of how that capacity results in the production and comprehension of sentences. Performance theories explain how the system of knowledge postulated in a competence theory interacts with other psychological systems such as memory, perception and the articulatory systems, in order to produce actual linguistic behaviour.)

But if grammars are competence theories, the question of how language is *learned* becomes acute. Normal children master language by about the age of eight. On Chomsky's view, this mastery entails, among other things, the

‘internalization’, ‘cognizance’ or ‘tacit knowledge’ of their language’s grammar. But a grammar is a highly complex body of syntactic, semantic, morphological and phonological rules, employing concepts and constructs far removed from experience. How do children internalize so complex a grammar at so tender an age, with apparently no conscious effort or instruction?

Chomsky argues that children’s acquisition of grammar is explicable only on the assumption that a substantial portion of the knowledge eventually attained is innate. On his view, a ‘Universal Grammar’ (UG), which specifies information about ‘linguistic universals’ (features common to all natural languages), is embodied in the language-learning mechanism itself. Thus, children need not *learn*, for instance, that declarative sentences must have a noun phrase as their subject: that fact they bring with them to the learning task. All they need do during learning is determine those facts (such as that, in English, the subject precedes the verb) that are *specific* to their language.

Chomsky is notable in that he does not rest content with the claim that we have innate knowledge of UG. Unlike his nativist predecessors, such as Plato, Descartes and Leibniz (see Nativism §2), he has offered two concrete proposals as to how that knowledge is realized.

Up to the late 1970s, he defended a ‘hypothesis-testing’ model of learning according to which children unconsciously project hypotheses about the grammar of their language, testing them against the data provided by experience. Their innate knowledge of UG, on this view, takes the form of constraints on the kinds of hypotheses they can entertain: they must be formulated in a particular language; they must have a certain form; and, in cases where the evidence is insufficient to arbitrate between two competing hypotheses, the language-learning mechanism itself will supply a decision.

More recently, Chomsky has embraced a picture of language learning as involving ‘parameter-setting’. On this view, which is as yet only partially developed, the principles of UG are encoded in the mind of the neonate, each principle containing one or more variables or ‘parameters’. A parameter’s possible values are extremely limited and are fixed by experience, different parameter-settings resulting in competencies in different languages. The ‘null subject parameter’, for example, governs whether one may omit the grammatical subject of a spoken sentence. Exposure to a language, like Spanish, where subjects may be omitted, sets the parameter one way; exposure to a language, like English, where subjects must be phonologically realised, will cause it to be set differently. Thus, children’s linguistic experience does not function as *evidence* for or against their grammatical hypotheses. Rather, and in much the same way as their hormones trigger the bodily changes that take place at puberty, exposure to the language of their community ‘triggers’ the mental changes that eventually result in linguistic competence.

Evaluating the merits of these models is in large part an empirical task and is outside the scope of this article. We will consider instead the case for linguistic nativism itself; that is, for the view that language-learning requires a task- or domain-specific mechanism of some kind.

2 The poverty of the stimulus

The commonest motivation for nativism is the argument from the poverty of the stimulus (POS). It contends that there is a ‘gap’ between the rich stock of linguistic knowledge that competent speakers acquire and the meagre supply of information about language that their experience during learning provides. This gap is so wide, the nativist contends, that no child endowed only with an empiricist-style, general-purpose learning mechanism could hope to bridge it. Language learning, therefore, requires a special-purpose device, one that embodies at the start some of the information about language that is ultimately attained.

This basic argument is elaborated in two ways. There are several a posteriori versions, due mainly to Chomsky; and a rather more a priori version with roots, seemingly, in Formal Learning Theory, a branch of mathematical linguistics.

A posteriori POS arguments are based on specific empirical claims about the inputs to and outputs of learning. In *Reflections on Language* 1975: 31 and following), for example, Chomsky claims that (1) competent speakers know the auxiliary fronting rule for question-formation; and that (2) the information available to children does not reliably distinguish the correct rule from incorrect but equally plausible alternatives. Hence, he infers, the

learner's choice of the correct rule is driven not by any general principles of theory-construction (such as the empiricist envisages), but is due rather to the fact that the acquisition device itself is biased towards grammatical rules of certain kinds, namely those conforming to UG.

Note that a posteriori POS arguments rely on specific empirical assumptions about the nature of linguistic competence and the data accessible to children. If it were discovered, for example, that speakers had *not* in any interesting sense internalized the rule in question, or that data disconfirmatory of incorrect rules were readily available, Chomsky would have failed to locate a gap - and hence to have supported his nativism. Hence, the success of a posteriori arguments turns on the degree to which their factual premises can be empirically sustained. But while some steps have recently been taken towards furnishing the supporting (for example, developmental) data required by arguments like this, their overall bearing on the nativism-empiricism controversy remains undecided.

In contrast to the preceding, the a priori POS argument (often called the Logical Problem of Language Acquisition) seeks to infer the existence of a gap from a consideration of the logical structure of the acquisition-task itself. Take some state in the learning process at which a child has acquired a grammatical hypothesis. Call the set of sentences (the language) generated by their hypothesised grammar *H*. Call that generated by the correct grammar (the target language) *L*. Then the learner is in one of five situations: (1) *H* is disjoint from *L*; (2) *H* overlaps *L*; (3) *H* is a subset of *L*; (4) *H* is a superset of *L*; (5) *H* is equivalent to *L*.

Situation (5) represents the end point of the learning process: the child has learned the target language. Situations (1), (2) and (3) are relatively unproblematic: the learner will be forced to revise their hypothesis if they hear a sentence in *L* that is not in *H*. Thus, they can converge on the correct grammar by exposure to 'positive evidence', evidence (as is provided by someone's uttering a sentence) that a given string of words is a sentence of the target language. But, crucially, if they are in situation (4) - if their grammar 'overgenerates', that is, generates all of *L* and also some sentences that are *not* in *L* - they cannot discover *this* by exposure to further sentences of the target language. For, every sentence of *L* is equally a sentence of *H*. What this learner needs is the information that a sentence that is generated by their grammar - a sentence in *H* - is *not* a sentence of *L*; only then can they 'shrink' their hypothesis so that it converges on the correct one.

This latter kind of evidence, that a sentence is *not* in the target language, is called 'negative evidence'. And case (4) is of interest because negative evidence is in general unavailable to children. *Explicit* negative evidence is scarce: children are not provided with lists of ungrammatical sentences; their errors are rarely corrected; nor do parents typically notice their own ungrammatical utterances. And *indirect* negative evidence is hard to find too. The non-occurrence of a sentence in the data, for example, is not negative evidence. For, there are infinitely many sentences of *L* that *de facto* will never be uttered. Hence from the mere fact that they have not heard a certain string of words in the data to date, the child cannot infer that it is not a sentence of the target language.

Thus learners who find themselves in situation (4) have no systematic access to evidence that would enable them to correct their overgeneral hypotheses. Which means, since children *do* eventually converge on the correct grammar, that they must never be in situation (4); the learning mechanism must be constrained such that they *never* hypothesize a grammar that is 'too large'.

Nativists contend that the general-purpose constraints on hypothesis-formulation envisaged by empiricists are insufficient to ensure that overgeneration will not occur. Hence, they conclude, the space of possible grammars must be constrained by further, linguistically-specific principles such as are provided by UG: the poverty of negative evidence in the data requires a nativist approach to language acquisition.

The a priori POS argument is at first sight much more compelling than its empirically undersupported a posteriori relatives. It is not, however, without points of weakness. First, one may question whether negative evidence is really as scarce as it seems. For example, while the non-occurrence of a particular sentence in the data may not be evidence that it is not grammatical, perhaps the repeated non-occurrence of certain syntactic forms could be evidence that sentences of that form are not grammatical. (That there must be at least *some* negative evidence available is evident from the fact that children do, as a matter of fact, recover from overgeneral grammatical hypotheses: they learn, for example, that you do not *always* add /d/ to the stem to form the past tense of a verb).

Second, one may question the nativist's contention that general-purpose constraints are insufficient to prevent a

learner's making incorrigible overgeneralizations. Not only is this contention to my knowledge unargued, there is reason to believe that in at least *some* cases, general-purpose learning strategies *are* efficacious in the face of what seem to be identical 'negative evidence' problems. For, negative evidence - evidence as to what things are *not* - is *quite generally* unavailable. When we learn what cars are, for example, we are not systematically informed about the countlessly many things that are not members of that class. Yet, and despite this paucity of negative evidence, we do manage to converge on the correct hypothesis about 'car-bonnet'. So, assuming that it is implausible to postulate a task-specific 'automotive faculty' that facilitates our learning in this domain, it must be the case that whatever general-purpose learning strategies we possess are in at least some contexts able to function successfully in the (near) absence of negative evidence.

In sum, arguments from the POS alone cannot compel nativism about language. We need additional reasons to think that there is something *special* about language acquisition - features it does not share with learning about, say, cars - such that nativism is plausible in the former case, while being clearly implausible in the latter.

3 Other arguments for nativism

Language acquisition has been held, by Chomsky and others, to be special in a number of ways that support linguistic nativism. Examples of these claims, and of the empiricist responses to them, are:

(1) *Species specificity.* Only human beings, so far as we know, speak a language. We thus possess a special biological affinity for language, an affinity which may amount to an innate language-learning faculty. Response: only human beings build cars, too, but that does not make for an innate automotive faculty. What our species possesses that others do not is general intelligence - an ability to learn from experience in a wide variety of contexts.
(2) *Critical period.* Language acquisition displays 'critical period effects': the ability to learn language declines drastically after puberty. This resemblance to other biologically-controlled developmental processes suggests that the acquisition of language too is determined more by our genes than our environment. Response: perhaps *all* learning declines after puberty. There are no data supporting the view that language-learning is special in this regard.
(3) *Facility of acquisition.* Language is acquired with remarkable speed and ease at a very early age. Processes distinct from those underpinning other kinds of learning are therefore at work. Response: given that we lack anything to compare language learning with, it is unclear that it is either notably fast, or especially easy.
(4) *Linguistic universals.* There are deep syntactic and semantic similarities among all known natural languages. Since there is no evidence to support the view that now-current languages descended from a common ancestor, these commonalities must be consequences of the way the language faculty is structured. Response: of course languages are shaped by the minds that use them. But linguistic universals may be due to constraints on what can be learned via a general-purpose learning strategy, rather than arising out of the structure of an innate language faculty.
(5) *Linguistic complexity.* Linguists, using *exactly* the 'general principles of theory-construction' beloved of the empiricist, spend entire careers laboriously constructing grammars for tiny corners of a language. But children can learn *all* of the grammar of *any* language simply by hearing it spoken around them. Surely some special faculty is at work here? Response: this argument assumes that there *is* an interesting sense in which speakers know - hence must learn - the grammar of their language. This assumption, however, may be challenged. First, there are conceptual difficulties involved in understanding what it is for a speaker to know a grammar. Thus, it is unclear whether children's ability to learn one is remarkable or not. Second, it has proved difficult to find empirical confirmation for the claim that grammars are implicated in any straightforward way in on-line linguistic processing. Thus it is unclear in what sense, if any, grammars need to be learned. And finally, one might question whether the linguist's methodology is appropriate for investigating the psychology of language use and understanding. Thus, while it is remarkable that the linguist's task in characterizing the language the child knows is dauntingly complex, this is of unclear relevance to the child's task in learning it.

In conclusion, Chomsky's claim that knowledge of language is largely innate has renewed the interest of linguists, philosophers and psychologists in the problem of explaining language acquisition. It remains, however, an open empirical question whether that explanation requires the postulation of a special-purpose learning mechanism embodying innate knowledge of language; and, if it does, what the nature of that mechanism and that knowledge

is.

Language, medieval theories of

*A great deal of theorizing about language took place in western Europe between 1100 and 1400. The usual social context of this theorizing was the teaching of grammar, logic or theology. Rhetoric was traditionally counted as one of the language disciplines (*scientiae sermocinales*) together with grammar and logic, but in practice it received little attention. Medieval thinkers produced a vast literature on aspects of linguistic theory, but they did not write books with such titles as 'A Theory of Language'. The theories that have come down to us today have been reconstructed from a large number of sources, even when they are attributed to a single person.*

Although the medieval writers on language were very innovative, they owed some key ideas to ancient Greek and Latin authors, for example: (1) words acquire their meaning by an act of 'imposition' when a sound is chosen as the label of some thing; (2) there are three key ingredients in signification: the word, a concept and the thing signified; (3) concepts can be thought of as mental words; (4) the grammaticality of a sentence cannot be explained purely in terms of morphology; and (5) words have different contents when used as predicates of creatures and when predicated of the Creator.

The medieval thinkers disagreed as to whether words signify things directly or only through concepts. The latter view ran the danger of making concepts a screen between language and reality, but it had the advantage of being able to explain why different words can signify the same object without being quite synonymous. Many thought that general terms signify universal things, but there were also nominalist schools which held that the general terms themselves are the only universal things. Fourteenth-century nominalists located universality in concepts, also called mental terms, and only secondarily in spoken words. The language of thought had gained priority over that of speech.

The theory of grammar known today as modism was developed in the thirteenth century. This theory assumed that there are only two contributors to the sense of an expression, lexical meaning and grammatical features, and that only the latter belong to the province of grammar, which thus became a purely formal science that could claim applicability to all languages irrespective of their surface differences. The problem with modism was that it had no tools for dealing with even slightly deviant, yet intelligible expressions. Thus it would have to reject a statement such as 'the crowd are *rushing' because of the lack of concord of number.*

A number of medieval scholars focused on the various forms of metaphorical language and ambiguity, which were more appropriate for dealing with deviant expressions of the type mentioned above. It was realized that speaker, listener and context must be taken into account in order to explain how words can communicate something different from their primary sense, and how it is possible for a listener to grasp the intended sense of an ambiguous message. One motivation for this study was a need to understand how theological discourse functions. Theology also lay behind a heated debate about the ontological status of the meanings of propositions, and sacramental theology joined grammar in developing a notion of performative locutions.

The study of syntax yielded many new concepts, including those of government and dependence. Much less work was done on the evolution of languages, but Roger Bacon and Dante did offer some perceptive observations. Though never creating fully fledged artificial languages, logicians did develop a semi-artificial Latin.

1 Sources

The most important source for grammar in the Middle Ages was Priscian's *Institutiones grammaticae (Institutions of Grammar)*, a comprehensive Latin morphology and syntax composed in the early sixth century AD. Priscian not only describes and prescribes but also reasons about linguistic problems, using a theoretical framework borrowed from the second-century Greek grammarian Apollonius Dyscolus. Priscian transmitted to posterity the notion that the grammaticality (*congruitas*) of a sentence depends on a proper fit among the conceptual elements signified by its constituent words. Also important were his classifications of words, including the eight-fold partition of constituents of sentences as *partes orationis* (parts of speech). These eight parts were known from other sources, but Priscian provided the best discussion of the subject. Matters left untouched by Priscian, such as tropes and figures, were treated in Chapter 3 of Donatus' *Ars Maior*, composed in the fourth century. Under the name of *Barbarismus*, this chapter became a focus around which investigations of deviant expressions developed.

In logic, Aristotle was the main source of inspiration. His *Sophistical Refutations* made it clear that an argument does not always carry its validity on its surface, and his explanations of why a bad argument may look good gave impetus to the development of studies in semantics, and to a lesser degree in the pragmatics of linguistic communication. In *Peri hermeneias (On Interpretation)* 1, Aristotle briefly sketches which relations hold between corresponding items in writing, speech, thought and external reality. According to the standard interpretation of this text, Aristotle says that written words signify spoken ones, which in turn signify concepts, while concepts signify things. This reading can support the notion that truth, validity and their opposites are not primarily properties of spoken or written sentences and arguments, but of their mental counterparts. If the Aristotelian level of concepts is equated with that of Priscian, grammatical and logical correctness (congruity and truth) have the same primary bearers, that is, mental propositions whose 'words' are concepts. Aristotle's definitions of noun and verb in *Peri hermeneias* 2-3 differ from those of the Latin grammatical tradition, and this tension between grammar and logic created fruitful discussion. In *Categories* 1, Aristotle introduces the notion of paronymy or denomination: for example, the just (person) is denominated from justice. From this seed, theories of primary and secondary signification developed (to continue with the example, 'just' primarily signifies justice and secondarily signifies a person).

The logical works of Boethius provided the notion of imposition (*impositio*). Following Porphyry, Boethius taught that words acquire their meaning by an act by which a human 'impositor' decides to use a certain sound to name some thing. He distinguished a first imposition, by which features of the physical world acquire names ('tree', 'green', 'three cubits long' and so on), from a second one by which names acquire names ('noun', 'verb' and so on). He further suggests that a word such as 'species' is a name of names, so that 'man is a species' is a statement not about man but about the word 'man'. This suggestion helped to fuel early nominalism.

In theology, some essays by Boethius were influential until about 1200, but the principal authority was always Augustine. These two authorities inculcated in medieval writers the conviction that ordinary words do not have their ordinary meanings when used of God. For God to be high and just is not the same as his having big quantity and the quality of justice. God in his absolute simplicity cannot be analysed in terms of the Aristotelian categories. This doctrine was particularly important in the twelfth century when, according to a widely accepted analysis, ordinary predication was thought to consist in the ascription of a certain form to some bearer or bearers. Any such form was supposed to belong to some Aristotelian category. Thus, 'Socrates is a man' ascribes the substantial form 'humanity' to Socrates, 'Socrates is just' ascribes the quality of justice to him, and so on. Since the truth of 'God is just' was uncontroversial, the Augustinian-Boethian doctrine forced medieval writers to deny one or both of the claims that (a) a predicate term always signifies some categorial form, and (b) in propositions of the type '*X* is *Y*', the form signified by *Y* is always attributed to the referent(s) of *X*. Usually, some combination of the two solutions was advanced. In the first place it was claimed that 'divine terms' ('God' in particular) never signify categorial forms; in the second place it was claimed that true propositions of the type 'God is *Y*' never ascribe categorial forms to God, but either indicate a sort of total identity between God and *Y* or actually ascribe a categorial form to his creation, so that 'God is just' may be paraphrased as 'there is justice in the created world, and it derives from God'.

Augustine (*De trinitate* XV) also contributed to the theory of mental speech his notion of a soundless 'speech in the mind' (*verbum mentis*) prior to any language in the phonic medium. He further gave a definition of a sign as that which, besides presenting itself to the senses, also makes the mind think of something other than the sign itself. In somewhat different wordings, this definition also occurs in Augustine's *De doctrina christiana* 2.1.1 and *De dialectica* 5. The last-named work had few readers; one, Roger Bacon, developed from Augustine's work an unusual awareness that signification is a three-term relation involving not only sign and *significatum* but also someone to whom the sign signifies the *significatum*.

The whole patristic tradition of Biblical exegesis provided another rich source for medieval speculation about linguistic matters, not least about metaphorical language.

2 Words, concepts and things: introduction

Words were said in the Middle Ages to signify (*significare* or *designare*). A special terminology was developed for reference, but it remained a matter for debate what sort of entities significates actually were.

Few writers of the period were very concerned about written words, which they considered as mere ‘stand-ins’ for spoken words, although Pierre d’Ailly pointed out that a written message can be understood directly without recourse to sound. Concerning spoken words, late ancient sources suggested that they signify things through concepts. Typological interpretation of Biblical passages introduced the further notion of words signifying things which in turn signify other things, but this model was relevant only in Biblical studies. Some, such as John Buridan, took the word-concept-thing model to mean that words signify concepts which in turn signify things, so that words signify things only thanks to the transitivity of signification. Others, notably several late-thirteenth-century authors as well as William of Ockham in the fourteenth century, took it in the sense that for words to have the relation of signification to things, they must also be related in a certain way (subordinated) to concepts.

Those who took words to signify things directly usually did so because they felt that otherwise the concepts would become an impenetrable screen between language and external reality. If concepts were what our words signify, then it seemed we would always be talking about mere psychological entities. Buridan preferred the alternative model, *inter alia* because it can explain how two words can have the same extramental referents without being strictly synonymous. It suffices that the two words have different concepts for their direct significates.

The link between word and significate was generally held to be conventional (*ad placitum*), as Aristotle had said, but this was understood more in the sense that the link was the result of a free choice than in the sense that it depended on agreement between the users of the language. This link was supposed to have been established by ‘the impositor’, a figure who can trace his ancestry through Boethius and Porphyry back to the ‘giver of names’ in Plato’s *Cratylus*. Some authors seem to have understood the ‘impositor’ very literally as some wise man who at some time had decided what things were to be called. Others took ‘the impositor’ to be a collective designation of the people who had introduced new words in course of time, so that in practice ‘word *X* was imposed to mean *Y*’ equalled ‘the traditional meaning of *X* is *Y*’. Still others distinguished between the original wise impositor(s) who devised the phonology and other grammatical features of the language and laid down a basic vocabulary, and later users of the language who added to the vocabulary through new acts of imposition while not introducing major systematic changes.

Boethius operated with a first imposition to produce words for natural phenomena, and a second one to introduce words predicable of words (such as ‘noun’ or ‘trisyllabic’). Early nominalists included terms such as ‘species’ among those of the second imposition, but after the thirteenth century the vocabulary of logic was more often described as words of second intention, ‘second imposition’ being reserved for the vocabulary of grammar. Neither the distinction according to imposition nor that according to intention was designed to cover the whole of a language’s vocabulary, but only such items as are predicable (*categore(u)mata*). The understanding of what sort of entities first and second ‘intentions’ are changed over time. To Ockham, a word of the second intention is one that signifies mental *intentiones* (concepts), which are natural signs of other things (the individuals falling under the concept). By contrast, words of the second imposition signify things which are conventional signs, namely words.

While most medieval writers ascribed freedom of choice to ‘the impositor’, they also assumed that sounds had not been selected at random. Thus there was a justification for etymology, the art of revealing which properties of some thing the impositor paid special attention to when selecting a sound to name it. For example, many found it probable that the Latin word for ‘stone’, the accusative form of which is *lapidem,* had been chosen because it is characteristic of stones to hurt one’s foot, and in Latin ‘hurting the foot’ is *laedens pedem,* which is somewhat similar to *lapidem*. Moreover, this aggressive feature of stones could be alleged as a reason for the masculine gender of *lapidem*. Theologians commenting on Genesis 2: 19-20, where Adam appears as the first giver of names, stressed that he selected appropriate names on the basis of his understanding of the nature of the things to be named. This conventionality of language was particularly emphasized by a number of fourteenth-century thinkers, who felt that the previous age had tended to produce overly rich ontologies by assuming some real distinction corresponding to every linguistic distinction they saw.

The act of imposition could be understood as one of uniting the material aspect of a word (sound) with a formal aspect (informational content). Thirteenth-century scholastics worried about how this could be possible. One proposal was that just as the formal features of a material thing can be transferred to the mind as an immaterial likeness (species), so the intelligible species can be communicated to other people by means of a material vehicle,

the mind impressing a sort of copy of the relevant species on any particular token of a type of the sound conventionally associated with some sort of thing. Roger Bacon took this mechanism to be the explanation of magic and, apparently, of ordinary persuasion. He thought that if the speaker's mind and body cooperate to emit sound carrying some species, the species may act as a force (*virtus*) capable in favourable conditions of producing changes in both material and spiritual things. However, many thinkers of the next century were to deny material words the ability to carry information; instead, they located the information in the concepts to which words correspond.

3 Words, concepts and things: nominalism

Shortly before 1100, some philosophers began to define universals as words (*voces*) or names (*nomina*), and to consider predication a linguistic phenomenon: words are predicated of words, not things of things. Logic thus became a genuinely linguistic discipline (see Logic, medieval). Porphyry's five predicables (genus, species and so on), Aristotle's ten categories (substance, quantity and so on), and Boethius' topical differences (genus, opposite and so on) could all be viewed as names applicable to certain classes of words, that is, as words of the second imposition.

Early representatives of this 'vocalism' apparently did not make it sufficiently clear that the voces that are the bearers of universality are not mere articulated sounds without regard to their meaning, and thus they laid themselves open to the objection that, in their theories, the Greek *anthropos* and the Latin *homo* would be two different universals even though they both mean 'man'. Likewise, *homo* uttered at one time would not be identical with the equiform sound uttered at another time. The supposed universal would thus dissolve into a host of individual sounds.

This problem in early 'vocalism' was solved when Peter Abelard, the father of a school of *nominales*, made it clear that the criterion of identity for a universal was its signification: several voces with a shared signification make up one *sermo*, he held, and *sermones* are the bearers of universality. The signification of a universal term consists first in naming (picking out) individual things, and second in a relation to mental acts (*intellectus*). The individuals that a universal (such as 'man') picks out share a circumstance (*status*), for example *esse hominem* (being a man), but a *status*, Abelard held, is no thing. Some of his followers seem to have taken a *status* to be what a universal signifies; thus terms acquired significates of a type similar to those of whole propositions, for 'Socrates is a man' was supposed to signify the *dictum* that-Socrates-is-a-man (*Socratem esse hominem*) (see Nominalism).

About 1200, nominalism almost disappeared and only returned after 1310 with William of Ockham and John Buridan as its leading figures. Both the latter operated with three types of language, written, spoken and mental, and of these the mental language was considered logically most important. According to Ockham, terms of the written language are 'subordinated' to terms of the spoken language, and they in turn are subordinated to terms of the mental language. A mental term is a natural sign of some set of individuals. Its subordinate spoken and written terms are conventional signs of exactly the same individuals, so signification always links a term to individual things. Buridan sometimes uses Ockham's terminology, but more often he assumes that written terms signify spoken terms which in turn signify mental terms, which finally signify individual things, the 'ultimate significates'.

To both Ockham and Buridan, mental terms are concepts, and they are the primary bearers of universality. Oral and written terms are so derivatively. Similarly, 'true' and 'false' are primarily predicates of mental propositions. In Ockham's mature theory, a concept is identical with an act of intellection, and its ontological status is therefore that of an accidental characteristic of a soul. The ability of a concept C to signify every member of some set S derives from a combination of (1) a causal history reaching back from C to some member x of S encountered in direct cognition (intuition), (2) an isomorphism between C and x, and (3) a maximal similarity between x and any other member of S.

Ockham's mental language was almost a duplication of spoken language, but sometimes, at least, he thought of it as a language purified of the ambiguities and redundancies of its spoken counterpart and held that spoken language has two strictly synonymous terms, mental language has only one. Similarly, he claimed that grammatical features of spoken language lack mental counterparts if they are irrelevant to the truth of a proposition. Thus mental language does not have grammatical gender, but it does have tense.

Ockham and Buridan assumed multiple denotation for general terms whether they be in the subject or the predicate position, and co-reference of subject and predicate term was their fundamental criterion of truth for a categorical proposition. According to them, an affirmative categorical proposition is true if and only if the subject and the predicate term each refer to (*supponit pro*) at least one individual, and any individual to which the subject term refers is also referred to by the predicate term. The occurrence of an empty term like 'chimera' renders any affirmative proposition false and any negative proposition true (see Propositions, sentences and statements).

Thirteenth-century thinkers typically took signification to be a relation linking words with universal concepts, common natures or the like. The technical term for the relation between word and individual things was 'supposition' (see §12). For fourteenth-century nominalists, however, both signification and supposition terminate in individuals, but a word supposits only when occurring as a term in a proposition whereas it signifies even when uttered in isolation. Generally, a word's *supposita* will be a subset of its significates. The exception is the case when a word supposits for itself (or equiform words), whether in the mental, the spoken or the written variant, such as 'man' in 'man is an absolute concept', 'man is a monosyllabic word' or 'there are three letters in man'. In such cases, the term was said to be used non-significatively.

Whereas the verb's tense and modality define the relevant set of *supposita*, quantifiers affect the way a term supposits and thus the way to spell out the truth conditions of the proposition by means of the technique known as exposition. Exposition replaces the original proposition by an equivalent conjunction or disjunction of propositions, or by one proposition with a conjunct or disjunct subject or predicate. Thus 'every man runs' → 'this man runs, and that man runs, and so on', 'some man runs' → 'this man runs, or that man runs, and so on'.

In the early fourteenth century, the dominant grammatical theory was based on the notion that words possess 'modes of signifying' from which they derive their grammatical properties. It took some time for nominalist philosophers to work out an alternative, but by 1400 a new grammar had developed which took mental language to be the primary bearer of grammatical as well as of logical predicates. Mental terms were said to signify 'nominally' or 'verbally' the grammatical categories built into the concepts. Well-formedness was claimed to belong to spoken strings of words only thanks to their 'subordination' to grammatical strings of mental terms, not thanks to any grammatical properties inherent in the spoken words themselves, for how could sounds bear such properties, which obviously have an origin in the mind? Proponents of such views on grammar included Albert of Saxony, Pierre d'Ailly and one Marsilius (possibly Marsilius of Inghen). Some fifteenth-century thinkers also accepted modes of signifying, but held that they resided in concepts, not in words.

One strange result of late medieval nominalism was that thought was often considered to be more genuinely language than speech.

4 Words, concepts and things: realism

Taking universality to be a predicate only of concepts and/or words was not the prevailing view in the Middle Ages; more often, universality was held to reside somehow in things, though requiring a mental operation to be brought out into the open. This is not the place for a history of realist theories (see Realism and antirealism), but two points need to be mentioned. First, the naïve Platonism in which universal Forms, residing in a world of their own, are the principles of being and of understanding for perishable things, while being also the significates of general terms, never had currency during this period. Second, probably the most influential variant of realism was one that arose in the thirteenth century and owed much of its inspiration to the Persian philosopher Avicenna (see Ibn Sina). While accepting the reality of universals, this theory did not make them the significates of general terms. Instead, it held that such words signify 'common natures' transcending the distinction between universal and particular, existence and non-existence. As the common nature was generally identified with quiddity and essence, it was considered a principle of the understanding and being of things, but not one that would bestow either universality, particularity or existence on them. Particularity and universality were considered different manifestations, as it were, of the same underlying common nature or *res* (thing). Such 'things', the theory held, may have being in many alternative 'ways' or *modi essendi* (modes of being), in a static and in a dynamic way, in a universal or a particular way and so on, and this is reflected in human understanding and language. Thus the distinction between nouns and verbs brings out the distinction between the static and the dynamic modes of being of things.

5 Words, concepts and things: modism

About 1260-80 a grammatical theory of high generality was developed, known as *grammatica speculativa* (theoretical grammar); today the standard term for this theory is ‘modism’. The first generation of ‘theoretical grammarians’ included Boethius of Dacia, Martin of Dacia and John of Dacia. Radulphus Brito and Thomas of Erfurt, both active around 1300, belong to the second generation. Few theoretical advances seem to have been achieved after about 1310, though the works of Martin and Thomas continued to be used for about two centuries.

The term *modus significandi* (way/mode of signifying) had been in use since the twelfth century, typically to explain why an abstract and a concrete word for the same thing are not interchangeable *salva veritate*. Stephen Langton, for example, claimed that *deus* (God) and *deitas* (godhood) have the same signification and the same referent, and yet the truth of *deus est in lapide* (God is in a stone) does not entail the truth of *deitas est in lapide* (godhood is in a stone) because *deus* and *deitas* do not signify in the same way. The first proposition is true because of God’s ubiquity, the second is false because it amounts to a claim that the stone is divine. By the mid-thirteenth century, it had become common to call grammatical properties of words ‘modes of signifying’, and a distinction had been introduced between a word’s ‘general’ (lexical) signification and the ‘special signification’ due to its grammatical form.

In a further development, the notion, inspired by Avicenna, of common natures and their modes of being provided a suitable metaphysics for a linguistic theory with ‘modes of signifying’ as the key concept. It was assumed that the structure of human language reflects a correct understanding of the structure of external reality. Each of the traditional grammatical categories reflects one way of thinking, a *modus intelligendi* (way/mode of understanding) of items of reality - *res* or *natura communis* - and each way of understanding corresponds to one of the ways in which such items are, a *modus essendi* (way/mode of being). For a word thus to belong to some grammatical category means that it signifies some thing in a certain way, as having a certain mode of being: for a word to be a noun means that it signifies some thing in the way things are signified under their static aspect (mode), and for a word to be a verb means that it signifies some thing in the way things are signified under their dynamic mode. The noun *dolor* (pain) and the verb *dolere* (to ache) signify the same *res*, but in different ways.

While the modes of signifying are derived from correct understanding of the modes of real things, once they have been found and have found morphological expression, nothing prevents humans from inventing a word such as ‘chimera’ and furnishing it with a noun’s mode of signifying. That mode of signifying indicates that if reality has a match for the word ‘chimera’, that thing must have static being. No particular facts about the external world can be deduced from grammar, only some general structural features.

Modes of signifying were divided into two types, *essential* and *accidental*. The essential modes establish the eight parts of speech, while the accidental modes establish moods, tenses, numbers, genders, cases and so on. Like the essential modes, accidental modes are derived from features of reality. Thus in reality things can have an active, passive or neutral way of being; this is the origin of the modes of signifying traditionally called masculine, feminine and neuter gender. A word must not be marked for masculine gender if the intended significate can have only feminine being, for that would make it the sign of another sort of thing than the one intended. However, for a word to be comprehensible it is only required that the mode of being indicated by the mode of signifying is compatible with the actual modes of being of the thing in question. Hence for things neutral with respect to action and passion, the choice of gender is arbitrary.

According to several modists, any particular word-form may be analysed as follows. First, it is a vocal sound (*vox*), endowed with a significative function (*ratio significandi*), one essential mode of signifying and some accidental modes of signifying. Having a significative function makes it into a sign, and having articulated sound (*vox*) for the vehicle of its significative function makes it into the sort of sign called a *dictio*. Having an essential mode of signifying makes it a *pars orationis* (part of speech, or in other words, a constituent of a sentence).

A fundamental, and controversial, thesis of modism was that the significative function linking a particular type of sound to some specific significate (*significatum*, *res*) is irrelevant for the grammaticality of constructions. Grammaticality is the result of licit combinations of modes of signifying. Thus {[+ noun + substantive + plural + nominative] + [+ verb + plural + third person]} is a licit combination, and any two words having those modes of signifying make a grammatical construction, no matter what their lexical meanings are. Thus ‘stones speak’ is as

correct as ‘men speak’. (In the schema shown above, the terms ‘verb’ and so on replace the cumbersome names of the corresponding modes of signifying.)

Modists assumed that external reality is accessible to human understanding, and that whatever can be understood can be expressed. Different peoples may choose different ways of encoding their understanding of reality in sound, but reality is the same for all and is understood in the same way by all peoples. Consequently, all languages must be structurally identical; they must all have the same grammar, surface differences notwithstanding. Greek (the modists wrongly assumed) has lexicalized ‘number’ as far as nouns are concerned and indicates it by means of special words called articles instead of using endings as in Latin, but what matters is that both languages can express ‘number’. If the underlying grammatical system is the same for all languages, it follows that there is total translatability between them, and modists thought as much. Indeed, they found empirical evidence for the thesis in the well-known fact that logic was first developed in a Greek context and written down in Greek, then successfully translated into Latin. If logic is international and translatable, then surely nothing is untranslatable.

Among medieval thinkers, the modists presented the most articulate theory of the universality of grammar. Fourteenth-century opponents of modism, such as John Aurifaber, sometimes explicitly denied the universality thesis.

6 Multiple signification: proper and improper locutions

A pervasive theme in the thought of Anselm of Canterbury is that people often use improper locutions, and that these must be recognized as such and replaced by the proper ones if truth is to be found. A typical example of his use of this technique concerns the argument that for any thing (*A*) existing at t_1, it was true at $t_{<1}$ that *A* could come into being, and so any actual thing has a potential predecessor. For Anselm, potency and power were not distinct concepts, and the argument thus became a claim that at $t_{<1}$, *A* had the power to come into being. It follows that the actual *A* may have generated itself; thus the created world needs no creator, as it has its own principle of existence. Anselm’s way of countering this line of thought is to claim that ‘Before *A* came into being, *A* could come into being’ is a colloquial way of saying ‘Before *A* came into being, God had the power to bring *A* into being.’ The improper locution leaves the false impression that at $t_{<1}$ *A* is the holder of the power to produce *A*, when in fact that power is held by God. This distinction between a more and a less proper meaning of words recurs in many guises in medieval thought.

7 Multiple signification: metaphor, allegory and author’s intention

Language with one surface meaning and another one hiding beneath the surface was of particular concern to the theologians. For one thing, it was agreed that ‘God is just’ cannot be interpreted in the same way as ‘Peter is just’. For another, it was commonly assumed that not only does the Bible sometimes use expresions that are only meant to be understood metaphorically (for example, ‘sprout from the root of Jesse’ as a metaphor for Christ), but often a Biblical text carries several senses besides the one apparent on the surface (*sensus historicus*). Thus ‘heaven and earth’ in Genesis 1: 1 could be said to signify heaven and earth on one level of interpretation, angel and man on another, spirit and flesh on a third. In such cases we are dealing with *allegoria in verbis*, that is, words having another meaning than or besides their *prima facie* meaning.

However, following a suggestion from Augustine in *De trinitate*, medieval writers also assumed an *allegoria in factis* (allegory in deeds), in which the words do not directly have any but their surface meaning, but the thing meant in turn means something else. This occurs in the Bible when words directly signify some event (*factum*) from the time of the Old Covenant, but indirectly also signify some fact belonging to the time of the New Covenant. Thus if the text says that the people of Israel were delivered from Egypt, the words primarily refer to the liberation of the Israelites from the Egyptian captivity; but this event in turn was a sign of the future liberation from evil of the members of the Church, which is then indirectly signified by the text. Interpreting in terms of *allegoria in factis* was later called ‘typological exegesis’.

The assumption of simple *allegoria in verbis* was a way to make sense out of apparent nonsense, and was just one of many strategies used in the interpretation of authoritative texts, secular and sacred alike. After the thirteenth century, a distinction was often made between what a text means *de virtute sermonis* (in virtue of its wording), that is, the meaning the text conveys to anyone knowing the vocabulary and grammar of the language in question, and

what it means *ex intentione auctoris* (in accordance with the intention of the author). By identifying the latter meaning with his own favourite view, a medieval author could avoid declaring his disagreement with an old authority.

In 1340, the Faculty of Arts at the University of Paris forbade its masters to call an authoritative utterance false in virtue of its wording if they thought the author had intended it in a true sense. Instead, teachers were required to say that the text had two senses, one of which was false and the other true, though both senses were 'in virtue of the wording' of the text. According to the reasoning behind the decree, it constitutes no violation of the 'virtue' (force) of the wording if an author intends the words to carry an unusual sense, for words have no semantic 'virtue' independent of their users. The explicit motive for the 1340 prohibition was fear of the consequences of accepting the judgment 'false by virtue of the wording' passed on a Biblical passage, as there might then appear to be a mismatch between the Bible's wording and truth.

8 Multiple signification: systematic use of metaphors (Gilbert and the Porretans)

Gilbert de la Porrée, Bishop of Poitiers from 1142-54 and father of a school of *Porretani*, barely escaped a condemnation for heresy (see Gilbert of Poitiers) for his claim that the proposition *Deus est Deitas* (God is Godhood) is false, while *Deus est Deus Deitate* (God is God in virtue of Godhood) is true. He appeared to be violating the doctrine of divine simplicity (see Simplicity, divine). The Porretans were also ridiculed for tripling the Aristotelian categories. These two pieces of unusual doctrine were in fact part of one theory.

As Augustine and Boethius had made clear, words cannot function the same way when used about creatures and about God. Christian theologians know that 'God is just' is a true proposition because it has the support of Scripture, but they do not fully know what its terms mean. What God is cannot be fully grasped by a human mind, at least not in this life. Nor is it clear what it is for God to be; used about creatures 'is' indicates temporal being, but this cannot be so with the Creator (see God, concepts of). For a creature to be just is to have a certain property, but the doctrine of divine simplicity forbids this interpretation of 'just' in the case of 'God is just'. To speak about God implies transferring terms from the known realm of creatures into the unknown realm of the divine.

Starting from this problem, Gilbert and his followers developed a general theory about transferred language. In their theory, language was originally instituted to deal with the direct results of creation. The terms of this primary language describe the members of natural classes with their substantial and accidental forms. The ten Aristotelian categories are ten classes of words which may be used to describe a subject by signifying a predicate; a predicate in turn is a form that constitutes the subject's being something or in-some-way. In other words, a categorial term signifies a substantial or an accidental form. Only natural things have genuine forms. Hence, properly speaking, the ten categories pertain only to this primary language, that of the *naturalis facultas* (natural domain).

Artifacts, social institutions, values and other consequences of human activity constitute an ontologically secondary group of things to be named, but the *moralis* (behavioural) language used for the purpose is not structurally different from the one used for natural entities. People speak as if houses, prices and moral values were constituted by substantial and accidental properties in the same way as trees and colours. Propositions still have the shape '*x* is *F*', although '*F*' does not signify a genuine form. Most of the words of behavioural language are also loans from the primary language: thus 'high' has been borrowed from the category of quantity to be used in a transferred sense about prices. The semantic contents of the words are of different sorts, but the vocabulary still falls into ten groups, ten quasi-categories, and quite generally the structure of the language remains the same. The behavioural language owes its intelligibility to its retention of the structural features of the natural language.

The second-order language of logic and grammar (*rationalis facultas*) similarly retains the structure of the primary language. There is no real form of equivocation, yet '*x* is equivocal', which has the structure of a genuine predication, may be true; and if it is so, we are justified in talking about the equivocation of *x*.

Finally, there is theological discourse. Words are transferred to new and fundamentally unknown senses. The only way to retain some sort of intelligibility is by obeying the same structural laws, the same syntax, as our primary language. One of the relevant laws might be stated as follows: if '*X*' and '*Y*' are concrete terms, and '*Y*-hood' the abstract term corresponding to '*Y*', then (1) '*X* is *Y*' implies '*X* is *Y* by virtue of *Y*-hood', and (2) '*X* is *Y*-hood' is nonsensical or false. Applied to the case of 'God is… ' the rule yields the result that 'God is God' implies 'God is God by virtue of Godhood', while 'God is Godhood' is an unacceptable proposition. Gilbert did not intend to

undermine the doctrine of divine simplicity. His discovery was that no intelligibility at all is left if one changes syntax and the meaning of the vocabulary at the same time.

9 Multiple signification: metaphor as a key tool in ordinary communication (Roger Bacon)

The mainstream tendency in the thirteenth century was to treat a word's meaning as an unchangeable companion of its sound once the word had been 'imposed' to mean something. This view implied, *inter alia*, that a word does not lose its meaning if such things as it signifies cease to exist; 'donkeys are animals' would be a meaningful (and, most would say, true) proposition even if donkeys had become extinct, and 'donkeys' would signify the same as when donkeys did exist. Similarly, while recognizing a difference between 'the donkey' used to refer to the asinine species and to a particular donkey, most philosophers would deny that a switch from one use to the other amounts to a change of signification.

Around the 1260s, Roger Bacon developed a radically different view. According to Bacon, there is no way in which a word can be imposed simultaneously as the name of an existing and of a non-existing thing, of a universal and of a particular, and so on. Words are instituted and learned with some definite meaning, but it is in every speaker's power to change that meaning. In fact, this is done all the time, and generally tacitly. People are continually confronted with the task of expressing something they have not thought of or talked about before. They habitually solve the problem by means of metaphors, using a term whose meaning is somehow similar to what they now need to express. For example, to someone 'John' may signify a certain animate being. Standing in front of John's dead body, this person may identify the body with the words 'This is John', without intending to say that the corpse is an animate being. Tacitly, 'John' has been given a new meaning (body that used to be the material component of a human being called John). The speaker has performed a new imposition and has rendered the term equivocal.

The correct interpretation of the term in each particular case depends on the speaker's intention. The hearer may not grasp it, but generally the ability of speakers to create metaphors is matched by the ability of listeners to grasp them. To Bacon, metaphor was the individual person's fundamental tool for communicating new thoughts, and we have new thoughts all the time.

10 Multiple signification: the intentionalist current in grammar

Modistic grammar was intended to be an Aristotelian science, with principles of its own. In this the modists had been anticipated by others, but they were particularly insistent on the point that grammar cannot allow the use of information obtainable only from other sources than its own principles. According to the modists, grammar is concerned with grammaticality, not with truth or reality, and a string of words is grammatically well-formed (*congrua*) if it exhibits no mismatched modes of signifying. For this string to be a complete (*perfecta*) sentence, it must fulfil the further requirements of containing a subject (*suppositum*) and a predicate (*appositum*), and of leaving no relations of grammatical dependence between the ingredient words unsaturated. In modism, the lexical content of the sentence's constituent words is grammatically irrelevant, and so are non-linguistic circumstances that might influence the interpretation of an utterance. It follows that *turba ruunt* (the crowd are rushing) is ill-formed, whereas *capa categorica* (a categorical cloak) and *Socrates curret heri* (Socrates will run yesterday) are well-formed expressions.

By contrast, many twelfth-century thinkers had held that such expressions are ill-formed because they are unintelligible. Congruity was required both on the vocal level and on the level of sense. This meant that many putative propositions could be dismissed as not even being grammatically correct sentences. Even lack of referents for an ingredient term could rob an otherwise good sentence of sentencehood and propositionhood.

Constructions such as *turba ruunt* violate rules of concord (in this case, the rule that a verb agrees in number with its subject). However, such constructions could be found in authoritative writers and were generally classed as 'figurative'. For an 'error' to qualify as a figure instead of a mere error, it must have some reasonable excuse: *figura est vitium ratione excusatum*, as the saying went. Moreover, the reasons excusing the deviant use of words were held to be twofold: there are reasons why the deviation is possible, and there are reasons why it is demanded, *ratio qua potest fieri* and *qua oportet fieri*, respectively. Reasons of the first type explain why the deviant expression is intelligible to an audience (for example, *turba ruunt* strongly resembles the correct *turba ruit* and

turba, though of singular number, signifies a plurality of people, so somehow the plurality required by *ruunt* is present to the hearer's mind). Reasons of the second type explain why a speaker would choose the deviant formulation rather than a regular one (for example, the use of a plural verb is needed to give a vivid impression of the many individuals that compose the crowd); that is, such reasons appeal to the speaker's intentions in formulating the message.

Figurative and incomplete constructions invited grammarians to take the situation of communication into account. Further, as in the case of metaphors, appeal could be made to the speakers' intentions as a major factor in deciding the meaning attributable to an utterance. This ran counter to modist principles, but since modism did not have any good tools for dealing with deviant yet intelligible expressions, even modists would sometimes adopt 'intentionalism', as this context-sensitive grammar has been called. Robert Kilwardby and Roger Bacon were among the foremost intentionalists.

In theology, there was an ongoing debate whether the verbal components of the sacraments were in some sense bearers of a power to sanctify along with their power to signify. The less inclined a theologian was to accept this, the more it would be stressed that the sacrament's efficacy depends on the intention of its original institutor and of its administrator (the priest).

11 Multiple signification: primary and secondary signification

Anselm, in his *De grammatico*, introduced a distinction between what a word signifies by itself (*per se*) and what it signifies via something else (*per aliud*). By itself *grammaticus* (literate) signifies literacy plus having (or having literacy); indirectly it signifies a human being to whom having literacy applies. The human being is not directly signified by the word, but anyone who understands it can supply the information that literacy requires a human possessor. Anselm also uses the expression *appellare* as a synonym of *significare per aliud*.

In the twelfth century, it became common to distinguish a word's signification from its appellation or nomination. The things 'called' or 'named' (*appellata*, *nominata*) were whatever things the term applies to considered in their own right, whereas the term was said to 'signify' also or exclusively a concept, a form or the things qua carriers of some form. Thus 'white' might be said to name white things but to signify whiteness. In the thirteenth century, 'nomination' disappeared and 'supposition' replaced 'appellation' as the general term in descriptions of the varieties of reference.

Thirteenth-century writers worked not only with the distinction between signification and supposition, but also with a distinction between primary and secondary (*secund(ari)a* or *ex consequenti*) signification. A concrete accidental term (white) was said to signify primarily a form (whiteness) and secondarily whatever has that form (the thing that is white). Similarly, a substance-term like 'man' might be said to signify primarily human form (humanity) and secondarily the 'aggregate' of matter and form (man). A relative (such as 'parent') could be said to signify one relative thing (the parent) primarily and its correlative (the child) secondarily. Excessive use of the distinction led some to hold that a proposition could be true or false *per se* on account of the primary significates of its terms and have the opposite truth value *per accidens* on account of their secondary significates.

In the next century, William of Ockham used the distinction as a means to keep his ontology lean. He operated with (a) *absolute* terms such as 'dog', which signifies individual dogs and nothing else, and (b) *connotative* terms such as 'white' or 'parent', which directly signify whatever individual things are white or parents but connote (that is, secondarily signify) their whitenesses and children. By treating all terms in categories other than substance and quality as connotative, Ockham could avoid positing special quantitative entities, relative entities and the like.

Buridan made very similar use of the concept of connotation although, confusingly, he stood the twelfth-century terminology on its head, saying that 'white' directly signifies and supposits for something white but connotes or *appellat* its whiteness. Similarly, 'rich' supposits for a man and *appellat* his possessions. Names of fictitious entities (for example, 'chimera') signify nothing directly, but they connote the real entities such monsters are mistakenly supposed to consist of (a snake's tail, a lion's head and so on). Oblique cases of nouns are limited to connoting; thus in 'Plato's donkey is running', Plato is only connoted whereas a donkey is directly signified. Buridan calls what a connotative term supposits its 'matter' and what it connotes its 'form', but the latter does not imply that his *connotata/appellata* are supra-individual things.

12 Multiple signification: properties of terms (supposition, ampliation and restriction)

Handbooks of logic from the later Middle Ages generally devote much space to the so-called ‘properties of terms’. The most notable of these are signification, supposition, ampliation, restriction and distribution.

The twelfth-century notion of supposition may have part of its background in Trinitarian theology, which distinguished between *suppositio personalis* and *suppositio essentialis* according to whether a term stands for one of the divine persons or the divine essence. However, the further development of supposition theory took place in the context of logic. The core idea of the theory is that a term does not always represent the same objects, even though it retains its meaning. In different contexts, the term refers to different subsets of the totality of objects of which it may be truly predicated. The proposition ‘all the doctors will dispute next year’ is ambiguous as to whether it claims that all presently existing doctors will dispute next year or that all the doctors existing next year will be disputing then. This was expressed in the rule that a general term acting as subject for a verb of future tense supposits for things present or future. Sometimes this rule comes in the form ‘things present and future’. The first formulation shows an understanding of the term’s *supposita* as the minimal set of objects that will verify the proposition; the second formulation takes the term’s *supposita* to be the conjunction of those sets.

Another core idea was that a term’s *supposita* are the individuals falling under it in some particular sentential context, but from the very beginning this idea was somewhat obfuscated by attempts to allow the notion of supposition also to cover other variations in the way a term may be understood. A distinction between personal and material supposition was commonly accepted. In personal supposition, the word ‘donkey’ stands for members of the asinine species; in material supposition, ‘donkey’ stands ‘for itself’, that is, for the word ‘donkey’, as in ‘donkey is a noun’. Counting material use as a sort of supposition was a complication of the theory, and it was often unclear what exactly was meant by ‘itself’ in the formula ‘standing for itself’. Another complication was the acceptance in the thirteenth century of a ‘natural supposition’: lifted out of any sentential context, a term was said to have natural supposition for the totality of objects falling under its signification. This could only make sense in an age when signification was not taken as a relation between a word and extramental particulars but between a word and some non-particular entity. Many authors further accepted a *suppositio pro significato* or *suppositio simplex*, claiming that in ‘the donkey is a species’, ‘donkey’ stands for the universal signified by ‘donkey’.

The notion of supposition was most successful as a tool for dealing with tense, quantification and the effects of intentional verbs (such as ‘know’ and ‘promise’). In the fourteenth century, Ockham and Buridan removed many of the inconsistencies in the knowledge inherited from the previous century. The notion of supposition was inextricably linked to those of ampliation (widening) and restriction. The idea is this: the set of objects for which a term would otherwise stand can be made bigger or smaller by the occurrence of some other word. Typically the neutral situation was taken to be that of a subject of a present-tense proposition containing neither modal nor intentional verbs - for example, ‘every man is running’ - in which ‘man’ was said to supposit for presently existing men. The addition of an adjective (‘every young man is running’) will restrict the set of verifiers by excluding old men. Saying ‘may be running’ instead of ‘is running’ extends the range of the term by adding an alternative set of verifiers, that of men who are yet to be (according to some authors) or that of possible men (according to others).

Fourteenth-century logic usually operated with four domains (sometimes called ‘tenses’): the past, the present, the future and the possible. Marsilius of Inghen proposed to add a fifth ‘tense’ or domain, that of the imaginable, in order to provide verifiers for propositions of the type ‘*X* is imagined’, in which ‘*X*’ refers to an object that is indeed imaginable even though it may not be physically possible. According to his proposal, the verb ‘is imagined’ ampliates its subject so that it supposits not only for actually existing things but also for imaginable ones. This was a considerable step in the direction of developing a theory of the language of fiction, a subject to which scholastic philosophers had paid little attention save for one much-discussed example: propositions about chimeras. Chimeras were supposed to be impossible entities, though it was often unclear what sort of impossibility was involved. Marsilius’ master, John Buridan, had sided clearly with logical impossibility, and to underline this he had ended up changing the medieval standard definition of a chimera, ‘animal composed of lion, cow and young woman’, into ‘animal composed of parts that cannot possibly be put together’. However this invited the question of what to do about logically possible, and hence imaginable, things that nature does not allow. This was the background of Marsilius’ proposal of an ‘imaginable tense’.

13 Multiple signification: ambiguity

After about 1150, Aristotle's *Sophistici Elenchi* provided the general framework for most discussions of ambiguity. Aristotle used six fallacies 'in speech'. Following Galen, medieval writers usually took these six fallacies to be due to three types of ambiguity (*duplicitas*), occurring in two types of expressions, single words (*dictiones*) or complexes of words (*orationes*). The resulting system is described in Table 1:

Table 1

Expression	**Duplicity** actual	potential	imaginary (*fantastica*)
Simple	equivocation	accent	figure of speech
Complex	amphiboly	composition and division	

An actual ambiguity was supposed to be present any time the expression is uttered. The standard example of equivocation was *canis*, which can refer to (1) a dog, (2) a dogfish, or (3) the Dog Star. According to late thirteenth-century doctrine, such a term could be disambiguated only by the immediate addition of a determination suitable to only one of the significates. Thus 'dog' was supposed to have only sense (1) in 'a barking dog' while keeping all three senses in 'a dog is barking'. Aristotelian equivocation was designed primarily for nouns, but medieval writers sometimes used equivocation in all parts of speech, even pronouns and prepositions. For example, some held that 'this' is equivocal with respect to all things that may be pointed at, and the preposition *de* was considered equivocal because it can indicate local origin or material composition, as in *Socrates est de terra*, which can mean (1) 'Socrates is *from* a country' or (2) 'Socrates is *composed of* earth'.

In genuine equivocation, one sense cannot be derived from another. Each sense derives from an independent imposition when a sound was chosen, without concern for whether it had already been selected to label some other thing. According to the principles of modist grammar, this would mean that there could not strictly be such a thing as an equivocal noun. There could be one phonetic entity common to three significates, but then there would be as many nouns as there are significates. When this was realized in the 1270s, an attempt was made to save the essentials of the theory while preserving the intuition that *canis* is exactly one noun with the same grammatical properties no matter which sense is intended by the speaker or needed to make the proposition true in which the word occurs. It was proposed that there are both active and passive modes of signifying, with the active ones residing in the word and their passive counterparts (indistinguishable from modes of being) in the things signified. One active mode may correspond to three different passive ones, it was claimed, and syntactic properties depend on the active modes. This was not a happy solution, since it introduced two levels of grammatical structure with the surface structure determining syntax. As so often in the history of linguistics, ambiguity had proved a hard test for a theory (see Ambiguity).

In the principal type of equivocation, the different senses of the word are not ordered. However, standard doctrine also accepted types of equivocation in which one sense could be described as primary or proper and the other(s) as secondary, improper or transferred, as when 'running' primarily describes fast foot-propulsion, but metaphorically describes the movement of a river. Thirteenth-century writers adopted the name 'analogy' for equivocation in which one thing is signified primarily and one or more others secondarily. If a term signifies all its significates, equally it always needs a determination in order to be disambiguated. An analogical term unaccompanied by any determination was held to represent only its primary significate. An Aristotelian example was often used: 'healthy' primarily signifies a property of animate beings, while secondarily it signifies (a) a property of animal excretions, namely that of indicating that the animal they come from enjoys good health, and (b) a property of food

and drugs, that of being conducive to the health of some animate being. To actually signify (a) or (b), ‘healthy’ needs to be joined with words like ‘urine’ or ‘potion’. This particular type of analogy was called *analogia attributionis*. A considerable debate arose concerning another example, ‘man’, which some held to signify primarily a compound of body and rational soul and secondarily a mere body. In this view, the primary significate is represented by ‘man’ in ‘this is a man’ and the secondary one by the ‘man’ of ‘this is a dead man’, and so the latter proposition does not entail the former.

Some modists assumed that the significative function (*ratio significandi*) assigned to an analogical term on its imposition was a complex one selecting different significates in different contexts. Radulphus Brito gave up considering the multiple meaning a property of the word itself prior to its actual use. The secondary signification comes about, he claimed, when a speaker uses a word improperly and a listener catches his intention thanks to a charitable interpretation of an utterance that would make little sense if taken literally. In so claiming, however, Brito sacrificed the modist axiom that only two factors contribute to the sense of an utterance: lexical (imposition-given) meaning and modes of signifying.

In the thirteenth century, it became standard doctrine that *ens* (being) is analogical as to substance and accidents. Attempts were made to use this distinction as a model for the relation between the use of terms for both creatures and the creator, and a long debate about the analogy or univocity of being ensued (see Being).

The notion of potential ambiguity led to a theory according to which the *litterae* (letters, phonemes) are the matter of an expression, which can be actualized only by the addition of a form, the ‘way of pronouncing’ (*modus pronuntiandi*), consisting in stress, pauses and the like. For example, in English the letters ‘i-n-v-a-l-i-d’ are the common matter of two distinct actual words, ‘*in*valid’ and ‘in*val*id’. The fallacy of composition and division was used, *inter alia*, to explain cases in which a string of words can be interpreted either as an atomic or as a molecular proposition; thus *falsum est Socratem esse hominem si est animal* can be read as an atomic proposition (‘that-Socrates-is-a-man-if-he-is-an-animal is false’) or a molecular proposition (‘that-Socrates-is-a-man is false, if he (or: there) is an animal’). The distinction between a ‘composite’ and a ‘divided’ sense also played a central role in the analysis of modal propositions. Often, *possibile est sedentem stare* was said to mean ‘that-a-man-stands-while-sitting is possible’ in the composite (or *de dicto*) sense, and ‘a sitting man has the possibility of standing’ in the divided (or *de re*) sense.

The notion of imaginary ambiguity was always somewhat unclear, but ‘figure of speech’ became a head under which the scholastics could examine the relation between (onto)logical and grammatical categories, for example, action versus active voice, substance versus substantive and individual versus singular number.

Use-mention ambiguity was usually dealt with in terms of supposition. In ‘man is an animal’, ‘man’ supposits personally (that is, for things signified by the word ‘man’), while in ‘man is monosyllabic’, ‘man’ supposits materially (for phonetic entities equiform with the word pronounced). On the other hand, ambiguous supposition was often classified as a mode of either equivocation or figure of speech.

Logicians classified words as either categorematic (roughly = nouns + verbs) or syncategorematic (mostly quantifiers, modal terms, prepositions and conjunctions). There were few ancient precedents for inquiry into the contribution of syncategoremata to the sense of a proposition, but a major research effort was made in the later Middle Ages, especially with regard to ambiguity traceable to the occurrence of such logical operators, including scope ambiguity.

14 The significate of propositions

Any syntagm could be called an *oratio*, whether a sentence fragment such as ‘a white horse’ or a whole sentence (see Propositions, sentences and statements). Among the different types of sentences, the declarative was both the grammarians’ preferred and the logicians’ sole object of study. In logic, the technical term was *propositio*, and the standard definition (from Boethius) was *propositio est oratio verum vel falsum significans* (a proposition is a syntagm that signifies a truth (or some true thing) or a falsehood (or some false thing)). Propositions were said to be either categorical (that is, atomic) or hypothetical (that is, molecular; in medieval terminology, conditionals are only one among several types of hypothetical propositions). The Boethian definition suggests that there are entities - truths and falsehoods - signified by propositions. In the twelfth century, the significate of a proposition was usually called *enuntiabile* (statable) or *dictum (propositionis)*, (what is said (by the proposition)). Thus ‘Socrates is

running' (*Socrates currit*) signifies the *dictum* that-Socrates-is-running (*Socratem currere*), and the string of words 'that Socrates is running' is the name of the *dictum* (*nomen dicti*). It was commonly, though not universally, assumed that the objects of knowledge and belief are *dicta*.

The ontological status of *dicta* was controversial. Nominalists could not give them full reality, for that would be a repetition of the error of hypostatizing the significates of single words. On the other hand, a *dictum* is either a truth or a falsehood, and some truths at least might seem to be eternal; but if *dicta* were eternal, there would be other eternal things than God, which was scarcely an acceptable thought. The majority view seems to have been that *dicta* are a sort of quasi-thing.

Controversy also surrounded the nominalist thesis *quod semel est verum semper est verum* (what is true at one time is always true). This thesis was theologically motivated. The pre-Christian patriarchs were assumed to have believed that Christ would be born, and that was a truth; Christians believe that Christ has been born, and that is a truth. Do Christians believe in the same truth as did the patriarchs? Or did the truth in which the patriarchs believed cease to be a truth when Christ was born? In the nominalist view, 'Christ will be born' and 'Christ has been born' express the same truth supposing that they are pronounced before and after his birth, respectively. The same true *dictum* has two differently tensed names, 'that Christ will be born' and 'that Christ has been born'. The nominalist thesis amounts to a claim that the class of linguistic expressions that are verified by the same event or events express the same *dictum*. Non-nominalists replied that the differently tensed 'that' clauses are or signify different statables; some tried to escape unfortunate theological consequences by denying that statables are what knowledge and belief have for their objects.

After the twelfth century, interest in statables abated somewhat, but it came back strongly in the fourteenth. Most authors then shared the belief that propositions, whether mental or spoken, are individual entities existing in time. Previously there had been a tendency to neglect the difference between proposition token and proposition type, but now the distinction came into the foreground, especially thanks to John Buridan. He also contributed to the popularity of a three-part analysis of propositions into subject, copula and predicate, with the copula treated as a term in its own right. The copula of a mental proposition could be described as a 'complexive concept' uniting the extremes. Pierre d'Ailly, while accepting the three-part analysis, insisted that ontologically a mental proposition is a unity; it is tripartite only in the sense that it is a cognition equivalent to the conjunction of three other cognitions.

Philosophers influenced by Ockham often held that the objects of knowledge and belief are mental propositions. According to Ockham, a proposition's truth is nothing other than the proposition itself, and it has no other significate than the individual things to which its terms refer. Some found this implausible, *inter alia* because truth would then seem to depend on the existence of propositions in human minds rather than on external reality. Instead, they (most famously Gregory of Rimini), took the object of knowledge and bearer of truth to be a state of affairs, *complexe significabile (tantum)* (something that can (only) be signified in a complex way, for example by a proposition, not by a term). The same quasi-entity could also be called *totale* (or *adaequatum*) *significatum propositionis* (the total (or: adequate) significate of a proposition), as opposed to the significates of each of its ingredient terms. Gregory vigorously denied that total significates are existing entities, whether mental or extramental. Consequently, he thought, God's uniqueness as an eternal being is not compromised by claiming that even before the beginning of the world 'complexly signifiables' were true or not true in virtue of the sign and source of all truth, God himself.

Walter Burley held the unusual view that just as vocal terms have real things as their ultimate significata, so vocal propositions ultimately signify propositions in external reality. However, he seems never to have reached a satisfactory answer to the question of what sort of thing such a *propositio in re* is. In one of his formulations, a real proposition has the things signified by its subject and predicate for its matter and a composition or division of that matter (in affirmation or negation) contributed by the mind for its form.

15 Syntax

The explicit aim of all medieval grammar was to spell out the rules of grammaticality (*congruitas*), or in other words, syntactical rules. The key term in grammatical syntax was *constructio*, standardly defined as *congrua dictionum ordinatio* (congruous linking of words), and most attention was paid to the pairwise linking of words

rather than to more complex linguistic entities. The elementary rules of concord were easily describable in terms of grammatical accidence; thus substantive nouns and adjectives were both said to have the accidents of gender, number and case, and the rule ‘a substantive and its adjective must agree in gender, number and case’ was thus a rule on how to match the accidents of one word with those of another. In modistic grammar, such concord could be described as a ‘proportionality of modes of signifying’, with the idea being the same, that certain secondary semantic features of one of the words to be construed require or forbid certain semantic features of the other word.

The relationship between the words to be construed was most often described in terms of determination, government (*regimen*), demand (*exigentia*), or dependence with the last term dominating in modistic grammar. In about 1300, a construction was taken to be the union of a *dependens* (dependent, unsaturated constituent) and a *dependentiam terminans* (a constituent that saturates the dependence). Just as in logic a proposition is a union or composition of subject and predicate, most simply expressed in the form ‘noun + verb’, so in grammar a sentence is a union of *suppositum* and *appositum*, most simply expressed as ‘noun + verb’, with the verb being the dependent constituent requiring saturation such as can be provided by the noun that signifies *per modum per se stantis* (purports that its significate is a self-sufficient entity). In the complex sentence ‘Socrates goes to the church’ the verb ‘goes’ has two relations of dependence, one being saturated by ‘Socrates’, another by ‘(to) the church’. As far as the verbs are concerned, the medieval notion of dependence had approximately the same function as the modern notion of valency.

16 Informative and performative locutions

While most medieval linguistic thought concentrated on descriptive propositions, a conceptual apparatus for talking about performative locutions did exist, at least since the early thirteenth century. This was provided by a distinction between *actus significatus* (or *conceptus*) and *actus exercitus*, act(ion) signified or conceived versus act(ion) performed. The distinction was used in several ways.

First, if *A* says ‘Bravo!’ when hearing *B* say ‘They sacrificed themselves’, the exclamation may either comment on the act of self-sacrifice signified by *B*’s statement or on the act performed by *B* in uttering the statement. This raises the question of whether in the first case ‘Bravo’ is construed as an adverb with the word ‘sacrificed’ but in the second case with an event, not with a word.

Second, some words signify what others perform. The words ‘I address you’ signify an action that is performed by saying ‘Hello’; ‘or’ and ‘every’ perform - or are means of performing - what ‘disjoins’ and ‘distributes’ signify. Some logicians held that syncategoremata (that is, logical operators) were purely performative, having no signification besides their function (*officium*). According to Ockham, ‘*B* is predicated of *A*’ should not be confused with ‘*A* is *B*’: in the former proposition predication is signified, in the latter it is performed.

Third, in some situations words which are usually informative (signify an action) become performative: when a priest says ‘I baptize you’, his words are instrumental in performing what they describe. Finally, some thought a confusion of signification with performance was the source of the Liar paradox, the act of saying signified by ‘I am saying a falsehood’ being confused with the act of saying performed by uttering those words.

17 The diversity of languages

Medieval theoreticians were aware of the possibility of non-vocal sign systems fulfilling the same role as ordinary languages, but spent little time on the investigation of any other non-vocal communication than that between angels, who were supposed to use no material signs because of their immateriality. The theoreticians were, of course, aware of the diversity of human languages but usually merely acknowledged the phenomenon, noting that different peoples can use different conventional signs for the same things. The modists of the late thirteenth century produced an account of how the shared human rationality and shared external reality resulted in one common linguistic structure (grammar), capable of accidental diversification through the arbitrary choice of material (sounds) to carry the sign function. Modists did not typically raise the question of a possible common origin of the different languages’ phonetic manifestations. Medieval writers who did raise the question usually agreed that the first human language, that of Adam, was Hebrew, and that there was some sort of connection linking Hebrew to the many languages spoken after the Babylonian confusion, but few apart from Roger Bacon and Dante had any clear ideas of linguistic development.

Dante Alighieri presented a remarkably well-developed theory of linguistic change in his *De vulgari eloquentia*. Dante operates with two types of language: (a) such as is the maternal tongue of certain people, (b) such as is no-one's primary language. Languages of type (a), the vernaculars, are subject to change, while type (b) languages, the 'grammatical' ones such as Latin and classical Greek, are exempt from change, their form having been determined once and for all by codified rules. The 'grammatical' languages are artificial; they have been created to avoid the breakdown of communication that spatial and temporal distances cause in natural languages. Contrary to the humanists of later periods, Dante did not see Latin as Cicero's maternal tongue, though he was clearly aware that it was based on ancient Roman vernacular.

To Dante the natural languages, the vernaculars, are the nobler ones. All derive from the language that Adam acquired on acquiring his soul. Thus far it might appear as if Dante followed modist teaching, for if Adam's acquisition of language was inseparable from his acquisition of soul, language is innate in humans. However, whereas the modists only claimed that all languages share an abstract structure, Dante saw them all as historical developments of one original language, that of Adam, which was not just an abstract structure but a fully fledged language with phonetics, vocabulary and syntax. He tried to make sense of the Babylonian confusion by taking it to represent the emergence of sociolects, each craft developing its own way of speaking. However, his finest observations concern the way language changes with time and how geographical isolation can make two branches of a language develop in different ways. Applying his theory to European languages, he assumed that all derive from three languages that must have arrived in very ancient times. One of these was the ancestor of Northern and Eastern European languages (about which Dante obviously knew little; Roger Bacon had been better informed), the second of the Romance languages, and the last of Greek.

Since Dante's purpose was to persuade his readers that Italian could serve as a language of refined literature, he had to face the argument that is always brought up when a new literary language is being formed, namely that there is no such common language with a describable form of its own but only a large number of local dialects. His counterclaim was that it makes sense to have a supra-regional Italian language, identical with no particular dialect but acceptable to educated people everywhere.

18 An artificial language

No medieval author envisaged an artificial, uninterpreted language. Nevertheless, some developments in logic pointed in that direction. The use of variables was known from Aristotelian syllogistics and was employed by medieval writers in the same way as Aristotle had done. Moreover, a number of standard examples developed into quasi-variables, the name 'Socrates' having any human proper name for its value, 'Caesar' representing any proper name of a human being from the past, 'currit' any present-tensed active verb, and so on. Thus, if a logician asked whether the proposition 'Caesar is a man' is true, he was asking about propositions with the proper name of a no-longer-existing individual for their subject term. Buridan explicitly recognized that the standard examples in jurisprudence, 'Titius' and 'Bertha', were not genuine proper names; they do not elicit singular concepts, but common ones.

Logicians also came close to creating an artificial language when they stated rules of supposition, often reflecting tendencies rather than hard and fast rules of Latin. Thus according to many logicians, *asinus cuiuslibet hominis currit* equals 'there is a donkey such that it belongs to just any man, and this donkey is running' while *cuiuslibet hominis asinus currit* means 'for just any man it is true that his donkey runs'. Though not quite aware of the fact, these logicians had created fragments of an artificial disambiguated language. This was to earn them much scorn from humanists, who could see no good in unnatural Latin.

Language, philosophy of

Philosophical interest in language, while ancient and enduring (see Language, ancient philosophy of; Language, medieval theories of; Language, Renaissance philosophy of; Language, early modern philosophy of), has blossomed anew in the past century. There are three key historical sources of the current interest, and three intellectual concerns which sustain it.

Philosophers nowadays often aspire to systematic and even mathematically rigorous accounts of language; these philosophers are in one way or another heirs to Gottlob Frege, Bertrand Russell, Ludwig Wittgenstein and the logical positivists, who strove to employ rigorous accounts of logic and of meaning in attempts to penetrate, and in some cases to dispel, traditional philosophical questions (see Logical positivism). Contemporary philosophers, too, are often attentive to the roles that philosophically interesting words (like ‘know’, ‘true’, ‘good’ and ‘free’) play in ordinary linguistic usage; these philosophers inherit from ‘ordinary language philosophers’, including G.E. Moore, J.L. Austin and again Wittgenstein, the strategy of finding clues to deep philosophical questions through scrutiny of the workaday usage of the words in which the philosophical questions are framed (see Ordinary language philosophy).

Philosophical interest in language is maintained by foundational and conceptual questions in linguistics, quintessentially philosophical problems about the connections between mind, language and the world, and issues about philosophical methodology. These springs sustain a rich and fascinating field of philosophy concerned with representation, communication, meaning and truth.

1 Philosophy of linguistics

Language is an impressive and fascinating human capacity, and human languages are strikingly powerful and complex systems. The science of this capacity and of these systems is linguistics. Like other sciences, and perhaps to an unusual degree, linguistics confronts difficult foundational, methodological and conceptual issues.

When studying a human language, linguists seek systematic explanations of its *syntax* (the organization of the language’s properly constructed expressions, such as phrases and sentences; see Syntax), its *semantics* (the ways expressions exhibit and contribute to meaning; see Semantics), and its *pragmatics* (the practices of communication in which the expressions find use; see Pragmatics).

The study of syntax has been guided since the 1960s by the work of Noam Chomsky, who, in reaction to earlier behaviourist and structuralist movements in linguistics (see Behaviourism, analytic; Behaviourism, methodological and scientific; Structuralism in linguistics; Saussure, F. de), takes an unapologetically cognitivist approach. Human linguistic capacities, he holds, issue from a dedicated cognitive faculty whose structure is the proper topic of linguistics. Indeed, Chomsky construes at least the study of syntax and (large parts of) semantics as attempts to uncover cognitive structures. Finding impressive commonalties among all known natural languages, and noting the paucity of evidence and instruction available to children learning a language, Chomsky suggests that surprisingly many features of natural languages stem from innate characteristics of the language faculty (see Chomsky, N.; Language, innateness of).

Whereas contemporary philosophers have tended to stay at a remove from work in syntax, discussing rather than doing it, semantics is another matter entirely. Here many of the great strides have been made by philosophers, including Gottlob Frege, Bertrand Russell, Ludwig Wittgenstein, Rudolf Carnap, Richard Montague and Saul Kripke. (However, quite a number of linguists and logicians who do not call themselves philosophers also have contributed heavily to semantics.) One major strand in semantics in the past century has consisted in the development and careful application of formal, mathematical models for characterizing linguistic form and meaning (see Semantics, game-theoretic; Semantics, possible worlds; Semantics, situation).

Pragmatics, at least as much as semantics, has benefited from the contributions of philosophers. Philosophical interest in pragmatics typically has had its source in a prior interest in semantics - in a desire to understand how meaning and truth are situated in the concrete practices of linguistic communication. The later Wittgenstein, for instance, reminds us of the vast variety of uses in which linguistic expressions participate, and warns of the danger of assuming that there is something aptly called their *meanings* which we might uncover through philosophy. J.L.

Austin seeks in subtleties of usage clues to the meanings of philosophically interesting terms like 'intentional' and 'true'. Austin keeps a careful eye to the several different things one does all at once when one performs a 'speech act' (for instance: uttering a sound, voicing the sentence 'J'ai faim', saying that one is hungry, hinting that one's companion might share their meal, and causing them to do so). His taxonomy has provided the basis of much subsequent work (see Speech acts; Performatives). H.P. Grice, while critical of some of Austin's methods, shared the aim of distilling meaning from the murky waters of use. Grice portrays conversation as a rational, cooperative enterprise, and in his account a number of conceptions of meaning figure as central strategies and tools for achieving communicative purposes. Grice's main concern was philosophical methodology (see §3), but his proposals have proven extremely popular among linguists interested in pragmatics (see Communication and intention; Meaning and communication). Recently, philosophers and linguists have become increasingly persuaded that pragmatic concerns, far from being mere addenda to semantics, are crucial to the questions of where meaning comes from, in what it consists, and how the many incompletenesses and flexibilities in linguistic meaning are overcome and exploited in fixing what speakers mean by their words on particular occasions (see Pragmatics; Implicature; Metaphor).

Our focus on language should not omit a field of study with a rather broader scope, namely *semiotics*, which is the study of signs and signification in general, whether linguistic or not. In the view of the scholars in this field, the study of linguistic meaning should be situated in a more general project which encompasses gestural communication, artistic expression, animal signalling, and other varieties of information transfer (see Semiotics; Animal language and thought).

2 Meaning: language, mind and world

Philosophy aims at intellectually responsible accounts of the most basic and general aspects of reality. Part of what it is to provide an intellectually responsible account, clearly, is for us to make sense of our own place in reality - as, among other things, beings who conceive and formulate descriptions and explanations of it.

In framing issues about our roles as describers and explainers, philosophers commonly draw a triangle in which lines connect 'Language', 'Mind' and 'World'. The three lines represent relations that are keys to understanding our place in reality. These relations in one or another way constitute the *meaningfulness* of language.

Mind ↔ *World.* Between Mind and World there are a number of crucial relations studied by philosophers of mind. Among these are perception, action, the mind's bodily constitution and intentionality (the mind's ability to think *about* what is in the world) (see Mind, philosophy of).

Mind → *Language.* Using and understanding language is a heavily mental activity. Further, this activity seems to be what the real existence of meaningful language consists in. In short, mind invests *meaning* in language.

Theorists of language focus on the Mind/Language connection when they consider *understanding* to be the cornerstone concept, holding, for instance, that an account of meaning for a given language is simply an account of what constitutes the ability to understand it (see Meaning and understanding). Philosophy has seen a variety of accounts of wherein understanding consists. Many have been attracted to the view that understanding is a matter of associating the correct ideas or concepts with words (see, for instance, Locke, J.; Frege, G.; Language of thought). Others have equated understanding with knowing the requirements for accurate or apt use of words and sentences (see, for instance, Davidson, D.; Dummett, M.A.E.). Still others find the key to understanding in one's ability to discern the communicative goals of speakers and writers (see, for instance, Grice, H.P.), or more directly in one's ability to 'pass' linguistically, without censure (see, for instance, Wittgenstein, L.). Certainly, these approaches do not exclude one another.

Some philosophers focus more on production than consumption - on the speaker's side of things - analysing linguistic meaning in terms of the goals and practices of speakers, and in terms of relations among communities of speakers (see Grice, H.P.; Communication and intention; Language, conventionality of; Language, social nature of).

Many of the philosophers who see understanding and use as the keys to linguistic meaning have held that the meaningfulness of language in some sense derives from mental content, perhaps including the contents of beliefs, thoughts and concepts. This enhances the interest of *cognitive semantics*, which is a thriving field of study (see

Semantics; Semantics, conceptual role; Semantics, informational; Semantics, teleological; Concepts).

It has not gone unquestioned that mind indeed can assign meaning to language, and in fact scepticism about this has figured quite prominently in philosophical discussions of language. Wittgenstein has been read as at least flirting with scepticism that there is anything our minds *can* do that would constitute meaning one thing rather than another (see Wittgenstein, L. §§10-12; Meaning and rule-following; Private states and language). W.V. Quine, starting from the thought that meaning is whatever good translation captures, and on arguments that good translation is not squarely dictated by any real facts, concludes that meaning is highly indeterminate. Quine is not alone in the view that linguistic and mental meaning are best seen not as 'out there' to be discovered, but rather as partly constituted or constructed by our practices of interpreting and translating (see Quine, W.V.; Davidson, D.; Dennett, D.C.; Lewis, D.K.; Radical translation and radical interpretation).

Language → Mind. If mind assigns meaning to language, so also language *enables* and *channels* mind. Acquiring and trafficking in a language brings one concepts, thoughts and habits of thought, with all sorts of consequences (see Sapir-Whorf Hypothesis; Linguistic discrimination; Language and gender). Indeed, having language is so crucial to our ability to frame the sophisticated thoughts that appear essential to language-use and understanding, that many doubt whether mind is 'prior' to language in any interesting sense (see Meaning and communication; Davidson, D.).

Language ↔ World. Since language is the vehicle of our descriptions and explanations of reality, philosophers are concerned about what if anything makes for a *true* or *apt* characterization of reality. Philosophers have these concerns for reasons of philosophical methodology (which we will come to in a moment), but also owing to the naturalness and plausibility of a certain picture of meaning.

According to this picture, the key to meaning is the notion of a *truth-condition*. A statement's meaning determines a condition that must be met if it is to be true. For example, my statement 'Ireland is larger than Manhattan', given what it means, is true just in case a certain state of affairs obtains (namely, a certain island's being larger than a certain other island). According to the truth-conditional picture of meaning, the core of what a statement *means* is its truth-condition - which helps determine the way reality is *said to be* in it - and the core of what a word means is the contribution it makes to this (perhaps, in the case of certain sorts of word, this would be what the word *refers* to) (see Semantics; Meaning and truth; Reference).

While the truth-conditional picture of meaning has dominated semantics, a serious challenge has been presented by philosophers, including Michael Dummett, who urge that the key to meaning is a notion of *correct use*. According to this alternative picture, the core of a sentence's meaning is the rule for its appropriate utterance. Of course, the two pictures converge if sentences are correctly used exactly when they are true. The interest of the distinction emerges only when (a 'realist' conception of) truth is dislodged from this role, whether because of scepticism about truth itself, or because truth is seen as too remote from the crucible of social practice to be the meaning-relevant criterion for correct use (see Realism and antirealism; Intuitionistic logic and antirealism; Meaning and verification; Dummett, M.A.E.; Truth, pragmatic theory of; Truth, deflationary theories of; Truth, coherence theory of; Truth, correspondence theory of). The challenge illustrates a sense in which the Mind/Language and Language/World connections can seem to place a tension on the notion of meaning (meaning is whatever we cognitively *grasp*, but the meaning of language just is its bearing on the world).

3 Linguistic philosophy

Apart from language's interest as a target of science and its centrality to our self-conception as describers of reality, language plays a key methodological role in philosophy. It is this role perhaps more than anything else that has explained the continued close attention paid to language in the past century by philosophers working in such varied areas as epistemology, aesthetics, ethics, metaphysics, the philosophy of science and the philosophy of mind.

The methodological role of language in philosophy is most easily explained by example. A philosopher is interested in the nature of value; they want to know *what goodness is*. Language enters when they observe that goodness is what is attributed when we *say* of a thing that it 'is good'. So the philosopher focuses on certain statements, and seeks an understanding of what such statements *mean* and in general of how they work. They explore whether such statements are ever objectively true or false, whether their truth or aptness varies from

speaker to speaker, whether a satisfying explanation of them entails that the word 'good' refers to or expresses a genuine characteristic (of actions, states of affairs, persons, and so on), and how their meaning relates to the distinctive sorts of *endorsement* that such statements commonly convey (see Analytic ethics; Emotive meaning).

The pattern exhibited in the example of value is apparent throughout philosophy. We are interested in knowledge, fiction, necessity, causation, or sensation, so we find ourselves studying statements *about* what interests us: statements attributing knowledge, describing fictions, asserting necessities, assigning causes and reporting sensations. Tools from the philosophy of language make available quite a number of views about what these statements mean and in general about how they do their expressive and communicative work; and these views inform and support philosophical positions on the real objects of philosophical interest. There have been dramatic and no doubt exaggerated claims about such techniques - for instance, that philosophy should simply *consist* in this sort of study of language. But it is if anything an understatement to say that linguistic sophistication has deepened philosophical understanding and has advanced debate in nearly all areas of philosophy (see Conceptual analysis).

Language, Renaissance philosophy of

Renaissance philosophy of language is in its essentials a continuation of medieval philosophy of language as it developed in the fourteenth century. However, there were three big changes in the fifteenth and sixteenth centuries. First, humanism led to a much greater interest in the practical study of languages, including Greek, Hebrew and vernacular languages, as well as classical Latin. Literary analysis and eloquent discourse were emphasized. Second, there was a loss of interest in such medieval developments as supposition theory, which meant that there was little discussion in logic texts of how words relate to each other in propositional contexts, and how sense and reference are affected by the presence of such logical terms as 'all', 'none', 'only', 'except' and so on. Only in early sixteenth-century Paris were these issues pursued with any enthusiasm. Third, the fourteenth-century insistence that both words and concepts were signs had several effects. There was a new interest in the classification of different sorts of signs, both linguistic and non-linguistic, particularly in the work of some early sixteenth-century Spaniards. Naturally significant mental *language was emphasized in a way that diverted the attention of logicians from spoken languages and their imperfections. Finally, concepts themselves came in for more attention, so that many of the topics discussed by logicians overlapped with what would now count as philosophy of mind, as well as with metaphysics. For instance, philosophers in the late scholastic tradition made much use of an early fourteenth-century distinction between the formal concept, which is a representative act of mind, and the so-called objective concept, which is whatever it is that is represented by a formal concept. The discussion of these issues by such writers as Pedro da Fonseca and Francisco Suárez has an obvious bearing on developments in early modern philosophy.*

1 Signs and signification

The central semantic claim of Renaissance thinkers was that the word or term is a sign, and the central semantic notion was that of signification. Frequent reference was made to Aristotle's remark (*De interpretatione* 16a3-4), 'Spoken words are signs of concepts' (see Aristotle §4); and there was widespread use of Pierre d'Ailly's definition, 'To signify is to represent some thing or some things or in some way (*aliqualiter*) to a cognitive power' (see Ailly, P. d'). Since categorematic terms such as 'cow' (unlike the categorematic terms 'concept' or 'mermaid') are intended to point to things in the world, a three-place relation of word, concept and thing was established. This account raises several problems: how syncategorematic terms (for example, 'all', 'none') can be signs; how non-referring categorematic terms are to be explained (see §3); and the precise nature of the word-concept-thing relation.

The problem of syncategorematic terms was much discussed by the nominalists of early sixteenth-century Paris (see Major, J. §2), and, following d'Ailly's definition, it was agreed that such terms signified in some way. That is, a syncategorematic term performs a function rather than pointing to an object, and this function is not itself signified by the term, though it can be in a separate locution. If I say 'No dogs are running', the act of negation is exercised; if I say 'That sentence is negative', the act of negation is signified.

The notion of signifying in some way was also extended to propositional signification by some authors, notably Fernando de Enzinas, who argued that a proposition (in the then-standard sense of an occurrent declarative sentence) does not signify things, whether ordinary things in the world or propositional complexes enjoying a special kind of existence, but performs a function. This discussion of propositional signification was linked with discussion of such issues as whether the proposition is the object of knowledge and judgment (assent and dissent) (see Toletus, F. §5), and whether it is the bearer of truth-values. These topics were still of interest to early seventeenth-century scholastics.

The precise nature of the word-concept-thing relation was the focus of the long-standing debate whether spoken words signify concepts or things. This question first became popular in the late thirteenth century, and it was still discussed by such late sixteenth- and early seventeenth-century authors as Franciscus Toletus, Sebastian de Couto (see Collegium Conimbricense) and John of St Thomas (§2). All the participants in the debate agreed on certain points. They agreed that concepts play an essential role in the significative process, for we cannot refer to objects we have no notion of. They also agreed that words are typically used to pick out things in the world rather than our own concepts. The debate concerned the way in which the role of concepts in the significative process was to be

described. Some authors, following such disparate figures as Aquinas and John Buridan, held that words primarily signified concepts and only secondarily signified things. Others, following William of Ockham, held that words signified things alone in virtue of being subordinated to concepts. Sebastian de Couto preferred to say that while the signification of things had a certain primacy, both concepts and things were made known by words, which thus enjoy a double signification. John of St Thomas held that words signify concepts more immediately and things more principally.

What has been said so far applies equally well to medieval and Renaissance treatments of the word as sign. There was, however, an important development in the fourteenth century which helps differentiate the later period from the earlier, and which stems from Ockham's insistence that the concept itself must be regarded as a sign. This notion (while foreign to Augustine) was not new, but Ockham made it central. In doing so, he made mental language (see §2) rather than spoken language the paradigm of signification.

Once the concept had come to be regarded as a sign, we find in some early sixteenth-century authors, especially Domingo de Soto (§2), a careful classification of signs, both linguistic and non-linguistic. In relation to the speaker, spoken words were said to be instrumental signs, because they were used as instruments of communication, and mental terms were said to be formal signs, because they represented by their very nature. In relation to the things signified, spoken words were said to be conventional signs, and mental terms were said to be natural signs, since their signification did not depend on choice or convention. In the various editions of his *Summulae*, Soto asked whether one should add a category of customary signs, such as napkins on the table as a sign of lunch. In the end he concluded that these signs were natural, albeit founded on a convention. Soto's classifications were elaborated by many later authors, including Sebastian de Couto and John of St Thomas; though at least one late sixteenth-century Spaniard, Domingo Báñez, did explicitly reject the view that the concept was a formal sign.

2 Mental, spoken, natural and conventional languages

The doctrine that the concept is a formal sign went hand-in-hand with the notion of mental language, a language of thought that is naturally significant and common to all human beings. Such a notion is present at least from Augustine on, but it was fully developed in the fourteenth century, first by William of Ockham and then by Pierre d'Ailly (see William of Ockham; Ailly, P. d'). Mental propositions were thought of as having syntactic structure and mental terms were thought of as having supposition, so that the notion of a language system was internalized. As a corollary, the place of grammar in the study of logic and philosophy of language was devalued. Some of the problems raised by the notion of mental language, such as the difficulty of identifying the mental correlates of demonstratives and pronouns, or of impersonal verbs such as *pluit* ('It is raining'), were still the object of lively debate in early sixteenth-century Paris. Later, the discussion of the structure of mental language disappeared, but the notion of an inner language remained. For instance, in his *Scholae (Lectures)* Petrus Ramus (§2) argued that logic or dialectic deals directly with thought, with *ratio* (reason) rather than *oratio* (discourse).

Whether mental language was seen as some kind of ideal language is unclear. Mental language certainly provided some kind of universality in that all spoken language was subordinated to it. However, it did not necessarily provide a common syntactic structure, for logically equivalent spoken propositions could turn out to be subordinated to different mental propositions. Nor was mental language necessarily thought of as being ideal in the sense of reproducing the structure of the world. On the other hand, it was supposedly ideal in the sense of being a language which was free of ambiguous terms and which contained only as much structure as was required for the formulation of judgments.

The discussion of spoken language was often related to two key episodes in the Bible: Adam's naming of the animals, and God's inflicting different languages on human beings as a punishment for building the Tower of Babel. One issue had to do with the nature of the original language and its relation to later languages. If the first language was Hebrew, as Isidore of Seville had held, in what form did it survive? If it was not Hebrew, did it completely disappear, or did it contribute at least some structure to the post-Babel tongues? A second issue had to do with the original institution of language: did Adam form it, or did God give him his language (as Sebastian de Couto, among others, held)? This in turn raised a third issue. Was the language instituted by Adam, or by God through Adam, a natural language in the sense of one that enabled users to grasp essences by virtue of a natural relationship between spoken words and the things named?

While this issue became more important in the seventeenth century with the work of such authors as Jacob Boehme and Francis Mercurius van Helmont, there was considerable discussion in the sixteenth century. The interest was due not only to biblical studies but also to the rediscovery of Plato's *Cratylus* and other classical sources, as well as to the strong Renaissance interest in magic and the Kabbalah, with the concomitant hope that a knowledge of natural language would enable one to exercise some control over the objects signified. The consensus, particularly among logicians, was that Aristotle was right, and spoken language is indeed conventional, whether it is directly God-given or not. On the other hand, the belief that language was conventional was seen as compatible with the belief that the institution of language is guided by reason (as Pseudo-Kilwardby had argued in the thirteenth century). To say that spoken words have signification *ad placitum* (by convention or agreement) does not mean that their signification is random and unmotivated. This point was emphasized by the Spanish grammarian Sanctius (Francisco Sánchez de la Brozas) in his *Minerva*, published in 1587. He felt that Aristotle, Plato and the Bible could be reconciled; and he also argued that the rational origin of language provided an underlying system of regularities in conventional languages.

3 Intentional contexts and beings of reason

Given the focus on spoken and mental terms as signs, one must ask what is referred to in intentional and modal contexts, or by fictional terms such as 'chimera'. Authors who worked within the medieval logical tradition, particularly the nominalists of early sixteenth-century Paris, attempted to treat both problems within the framework of supposition theory. There are elaborate discussions of the reference of 'horse' in such contexts as 'I promise you a horse', 'A horse is necessary for riding', 'A horse is imaginarily a chimera'. In particular, people asked whether it was legitimate to postulate reference to imaginary and impossible objects, or whether the reference of terms in special contexts could be explained solely in terms of reference to ordinary past, present, future and possible objects. In the later sixteenth century, this type of discussion disappeared from most logic texts, though there are still references in Pedro da Fonseca.

What did survive, at least in the scholastic tradition, was the discussion of beings of reason (*entia rationis*). This investigation, which can be traced back to the thirteenth century, did not focus on the problem of reference in special propositional contexts, but on the reference of terms in general. There were said to be two types of being, real beings which (with the exception of God) fall under Aristotle's ten categories, and beings of reason (*entia rationis*), which include negations, privations and relations of reason. The latter included the logical second intentions (that is, higher-order concepts used to organize first-order concepts) such as 'genus' and 'species'. Beings of reason are non-categorial and exist only because of the work of the human mind, though they may have some foundation in reality. 'Nonbeing', for instance, is a term which is significant as referring to a pure negation; and 'blindness' is a term which is significant as referring to a privation, the absence of a capacity that animals normally have; yet neither pure negations nor privations can be literally parts of the world. They must be conceptual entities. Genus and species terms (as opposed to the terms 'genus' and 'species' themselves) were often included among the terms whose significance involves relations of reason. As Domingo de Soto (§2) indicated, the point here is that when we say 'A human being is an animal' our general terms do not refer to special universal things, humanity and animality, but they imply a well-founded relation between particular individuals in the world and the concepts we use to classify them into groups. There was general agreement that chimeras should be classified as negations, and some people held that they were the most proper examples of beings of reason since, as impossible, they must be completely mind-dependent (see John of St Thomas §§2, 4; Suárez, F. §2).

4 Analogy

Analogy as a theory about a certain sort of linguistic usage has thirteenth-century roots, and involves three problems. First, there is the problem of equivocal terms as Aristotle introduces it at the beginning of his *Categories*. Equivocal terms (for example, 'bank') are those which can be used in two quite different senses, and it seems natural to extend the notion of an equivocal term to cover terms that are used in different but related senses. Second, there is the metaphysical problem of how to discuss being (*ens*) in general when the being of a substance is so different from the being of an accident. Third, there is the problem of religious language. How can words normally used of humans, such as 'just' or 'good', be meaningfully used of God, when God is so different from human beings? In answer to these problems, logicians and theologians developed a theory which divided words into three sorts, independently of context. Some were univocal (always used with the same sense), some were

purely equivocal (used with totally different senses), and some were analogical (used with related senses).

The term ‘analogy’ itself had two senses. In the original (Greek) sense, it involved a comparison of two proportions or relations. Thus ‘principle’ was said to be an analogical term when said of a point and of a spring of water because a point is related to a line as a spring is related to a river. This type of analogy came to be called the analogy of proportion, proportionality, or (by Cajetan) proper proportionality. In the second sense, analogy involved a relation between two things (or one pair of things and a third), of which one is secondary and the other primary. Thus ‘healthy’ was said to be an analogical term when said of a dog and its food because while the dog has health directly, its food is healthy only as contributing to or causing the health of the dog. This second type of analogy became known as the analogy of attribution.

One of the main subjects of debate was how to classify types of analogy, and how to apply the various types to the different metaphysical and theological cases mentioned above. Although in *De veritate (On Truth)* Aquinas said that religious language must be interpreted by means of the analogy of proportionality, in other writings he appealed to the analogy of attribution. During the fourteenth and fifteenth centuries most logicians and theologians, including Capreolus, appealed to the analogy of attribution (if they discussed the topic at all). At the end of the fifteenth century, however, Thomas de Vio, Cardinal Cajetan argued that the analogy of proportionality was the only true analogy (see Cajetan §2). Cajetan’s view was not always accepted, but there was much discussion of the issue by the later scholastics, including Soto, Fonseca (§3) and Suárez (§2) (see Silvestri, F.).

The other main subject of debate is very closely related to philosophy of mind, and springs mainly from the work of early fourteenth-century philosophers, particularly Duns Scotus. Latin translations of Aristotle maintained that the difference between a univocal term and an equivocal term was that the latter was subordinated to more than one *ratio*. The *ratio* soon came to be identified with a concept, and the question then was how many concepts are involved when an analogical term is used. There were three views among logicians and theologians. Analogical terms could be seen as straightforwardly equivocal terms subordinated to two distinct concepts; they could be seen as subordinated to an ordered cluster of concepts (possibly but not necessarily described as a disjunction of concepts), or they could be subordinated to a single concept which represents in both a prior and a posterior manner (*per prius et posterius*). Scotus and his followers rejected all these possibilities, and argued that the word *ens* was univocal, but a lively discussion continued (especially among Thomists) until the time of Suárez.

Many of these thinkers made a distinction between formal and objective concepts. The formal concept was the act of mind or conception that represented an object, and the objective concept was the object represented. If the spoken word ‘being’ corresponds to just one formal concept (a point on which there were some differences of opinion), the focus of discussion shifts to the status of the objective concept. Is it the actual thing in the world which is thought about; is it a common nature or some other kind of intermediary entity which is distinct from the external object without being mind-dependent; or is it a special kind of mind-dependent object which has only objective being, the being of ‘being thought’ (*esse objective*, *esse cognitum*)? It is at this point that philosophy of mind and ontology take over from philosophy of language.

5 Humanism

Humanists, including Valla, Erasmus and Vives, were more concerned with the description of language as a literary phenomenon and with the cultivation of eloquence than with philosophy of language proper. The late fifteenth and sixteenth centuries saw an explosion of practical language studies. New humanist grammars appeared which prepared students for literary analysis rather than philosophy and theology; Greek and Hebrew studies expanded; there was an increasing use of and interest in vernacular languages; biblical studies and translations flourished; the widespread use of printing focused attention on problems of spelling and grammatical norms; and there was new interest in forms of writing, including Hebrew characters and Egyptian hieroglyphs. This last interest was often combined with a belief in magic. Agrippa, for instance, discussed how one might manipulate the numerical values of the letters of the Hebrew alphabet in order to make contact with the spirit world.

Language, social nature of

Language is mostly used in a social setting. We use it to communicate with others. We depend on others when learning language, and we constantly borrow one another's uses of expression. Language helps us perform various social functions, and many of its uses have become institutionalized. But none of these reflections settle the question of whether language is an essentially social phenomenon. To address this we must consider the nature of language itself, and then ask which social elements, if any, make an essential contribution to its nature.

While many would accept that language is an activity that must take place in a social setting, others have gone further by arguing that language is a social practice. This view commits one to the claim that the meanings of an individual's words are the meanings they have in the common language. The former view need not accept so strong a claim: meaning depends on social interaction because it is a matter of what one can communicate to others but this does not require the existence of communal languages. A competing conception which rejects the social character of language in either of these versions is the thesis that language is mentally represented in the mind of an individual.

1 Linguistic Platonism

Languages can be used in many ways and for many purposes, but a dispute about the nature of language concerns language in its most fundamental sense. Is it fundamentally social or do individual speakers have their own languages?

One view of language, which will not be discussed in any detail in this entry, is linguistic Platonism. This is the view that languages are formally characterized abstract entities existing independently of all speakers. Platonists then seek to define a relation between these abstract objects and speakers to determine which is the actual language of an individual or a population. The actual language relation may be defined either in terms of the conventional practices adopted by a population, or the psychological make-up or linguistic intuitions of the individual language-user. Thus Platonism does not settle the issue of whether languages are properties of individuals or social groups.

2 Communal languages and idiolects

A broad division exists between those philosophers and linguists who think the fundamental conception of language is that of a shared public language, and those who consider the fundamental notion to be that of an individual's language or idiolect. Within each of these schools there is room for disagreement about the precise nature of languages and idiolects. These differences will be reviewed below.

Michael Dummett (1989), following the ideas of Ludwig Wittgenstein (1953), offers a number of arguments for the communal conception of language. One of these goes via his rejection of Platonism. For Dummett, the objectivity of meaning requires the meaning of a word to be independent of any given speaker's judgment of it. But if the meaning of words were independent of all speakers, as the Platonist suggests, this would open up the sceptical possibility that all speakers could be in ignorance about the actual meaning of words in their language. Rejecting this possibility, Dummett insists that what an expression means among a community of language-users must be determined by the publicly observable conventions governing its use.

Dummett also argues that the publicity of meaning is required to ensure successful communication. Because speakers hold themselves responsible to the conventional meanings of words in taking themselves to be speaking a given language, what they say when uttering certain words is what those words mean in the communal language to which they belong. It is only because there are such conventional practices that meaning is shared and communicable; and for Dummett, were it not for such standards of use, speakers could not know they attached the same significance to their words. Meanings would be private and incommunicable, hidden in the minds of each individual speaker. But if this were the case, we could never learn a language, or know if someone else understood it. But we can work out what people mean by the observable use they make of their expressions; and to learn or understand a language is simply to participate in these shared linguistic practices. However, no speaker will be fully competent in the conventions governing the use of words and rules for grammatically compounding them; at most speakers will have a partial mastery of the public language. Nevertheless, for Dummett communication

depends on the standards of the communal practice.

Similar considerations have been advanced by John McDowell (1988) who regards the possibility of thought and of knowing the minds of others as depending on our speaking a communal language. We arrive at our thoughts by finding the words to express them, and so in virtue of the language in which we do this we make our minds immediately available to one another. The words you use to express a thought will express the same thought for me and so, just in virtue of hearing you speak sincerely, I can know what you think. This is possible because the meanings of a speaker's words lie open to view on the surface of his practice. But they are recognizable only to those who share those practices. These ideas hail from the later work of Wittgenstein, who saw language as a social practice governed by rules of use (see Meaning and rule-following). Along with Wittgenstein, Dummett and McDowell assume that in the absence of shared languages, or observable conventions of use, our knowledge of others' meanings would be a matter of psychological speculation about what goes on in a private realm concealed behind behaviour. And, given the doubtful coherence of a private language, McDowell thinks the absence of shared languages would de-stabilize communication, meaning and thought.

Not every defender of communal languages accepts the publicity of meaning. It is possible to argue that private states are involved in the meanings of public language items so long as speakers have sufficiently similar responses to the situations in which those words are used. On this view, it would be enough for the purposes of communication that speakers attached the same significance to terms in the language: they would not also have to know that they did. Success in communication would be a contingent matter and could never be guaranteed (see Private states and language).

The strongest opposition to the communal view of language comes from those advocating the idiolectic conception of language, although there is deep disagreement amongst the protagonists over the extent to which an idiolect is social or psychological in nature. However, all proponents of the idiolectic view resist the assumption made by Dummett and McDowell that if a language is not shared then the meaning of an individual's words would have to be subjective and private. It does not follow from the fact that meanings are publicly discoverable that they are shared. I can work out the meaning someone attaches to a word without attaching that meaning to it myself. Donald Davidson (1986) stresses malapropisms as providing cases of this kind (see §4). The denial of shared language does not entail the privacy of meaning and the publicity of meaning does not require a communal language. The arguments of McDowell and Dummett designed to show that the language of an individual would be necessarily private remain inconclusive. Facts about my idiolect may be knowable by those I interact with, and linguists studying me scientifically may know more about my idiolect than I do.

3 Language as a psychological or a social phenomenon

Noam Chomsky (1986) is a vigorous opponent of the notion of shared public languages. He argues that there is no empirically respectable way to define such a notion. According to Chomsky there is no such thing, for example, as English, or Dutch, or Chinese. In each case there is no single set of grammatical rules, shared vocabulary items, or rules for pronunciation which characterize the language in question. Whether we include every idiosyncratic use of every word and rule of grammar by a particular population of speakers, or select only the intersection of those uses, what is specified is a language nobody knows or speaks. The same problems beset attempts to delimit a dialect. For this reason, Chomsky abandons the everyday use of 'language', which he calls E-language: this being an ill-assorted set of overlapping practices, patterns of deference, power relations among speakers, and so on. He replaces it with the notion of a speaker's I-language: an internal component of the individual's mind/brain which assigns meaning and structure to the sounds and signs the speaker encounters. The I-language is a cognitive psychological entity - a state of the language faculty - which together with a lexicon of word-like items determines the extent of the speaker's idiolect.

According to Chomsky, language is essentially defined by its meanings and structures, but these exist only as mental representations in the mind of the speaker - as part of the speaker's knowledge of language - and have no reality in the external or social world. Linguistically, the world contains only sounds and marks: it is creatures equipped with a language faculty who assign them meaning and structure. At first, this is achieved without reference to others. Our earliest interactions will of course influence our acquisition of vocabulary and the particular grammar we attain although, in the case of the latter, Chomsky regards this as environmental triggering: a prompt from one's surroundings to set the parameters of a system that is already in place. Thus the development

of one rather than another I-language is the result of interaction between the linguistic environment and the innate linguistic system (see Language, innateness of).

After we attain mature linguistic competence, we often defer to others in positions of authority in their use of words and assessments of grammar. But Chomsky points out that this is social behaviour undertaken after we have acquired a language, and so it does not constitute an essentially social contribution to it. On the notion of language Chomsky favours, the study of language becomes a branch of individual cognitive psychology. The study of group behaviour has no impact on it. Communication is not, on this picture, essential to language. Language is primarily a means of expressing thought. Speakers and hearers do have the means to try to make sense of one another's talk and the closer their I-languages and vocabularies are to one another, the more chance they will have of success. However, for Chomsky, communication is risky and success is never guaranteed so it cannot provide the basis for linguistic competence.

Where he is willing to acknowledge a pervasive social aspect of language is in the case of the division of linguistic labour: a phenomenon Hilary Putnam (1975) drew attention to. This occurs where there are words having an everyday sense and a more technical meaning without being ambiguous. The words 'gold' and 'carburettor' provide examples for those with little knowledge of chemistry or cars. Speakers can use these words without knowing their precise meanings because they defer to experts in their community who know how to fix the meaning and reference of those terms precisely (see Putnam, H. §3). Chomsky points out that the entries for such words in a speaker's mental lexicon will specify the meaning of the terms as far as the speaker's (partial) knowledge carries him, but they would also include an indication that further details are to be filled out by others. The meanings specified in this way do not go beyond what can be studied in an individual's knowledge of language. It is not to concede that language includes any essentially social elements. The phenomenon Putnam alludes to, while extensive, is not fundamental to the use of language. People could cease to use terms they did not fully understand without ceasing to speak or understand a language. What this shows is that the division of linguistic labour provides the weakest claim for the social character of language. Other reasons are needed to conclude that language is necessarily social in character.

4 Idiolects as social phenomena

Arguments for this are provided by Donald Davidson and Tyler Burge, although they differ in their conceptions of what makes an idiolect social.

Davidson rejects the idea of language as 'a clearly defined shared structure' which language-users learn and deploy in communicative exchanges. The appeal to conventions is neither necessary nor sufficient for linguistic communication, since speakers and hearers need not attach the same meanings to their words nor stick to the conventions they have established in order to make sense of one another's remarks. All that is required is that the hearer know what the speaker means; it is not additionally required that the hearer attach the same significance to their own use of those words. The cases of malapropism and slips of the tongue serve to make the point. I can know that someone uses 'debated' as I use 'abated' when they say 'The rain has debated'. But there is no reason for me to adopt their use of that word. So long as I can work out, by means of interpretation, what significance the speaker intends their words to have, I can understand them without having to share their language. Communication does not require speaker and hearer to belong to the same linguistic community, or to share a set of linguistic practices; it requires them to share an ability to interpret one another's utterances as part of a larger project of making sense of one another's behaviour in rational terms through the attribution of beliefs, desires and intentions. Part of this project will consist in assigning meanings to people's utterances that make sense of what they say against the background of the mental states we take them to be in. Clues of all kinds can figure in the evidence an interpreter draws upon to work out the meaning of someone's remarks, and no single set of shared conventions will be necessary or sufficient for this task.

While it is unlikely that any two speakers will ever speak the same language - minor differences in their vocabularies or grammar will always distinguish their idiolects - what they must share, according to Davidson, is the method of interpreting one another's speech. It is this condition which ensures the notion of idiolect has a social dimension since speakers can only mean what others can recognize or interpret them as meaning. The meanings of the words and sentences of their idiolects are fixed by others' publicly determined interpretations. For Davidson, the possibility of meaning anything depends on successful communication with another: having one's

words interpreted as one intends them to be interpreted. In this way, meaningful speech, although it demands nothing more than a variety of idiolects, is necessarily social (see Radical translation and radical interpretation §§7-10).

Burge (1989), in contrast, argues that social factors beyond the scope of local communicative interactions play an essential role in the meaning of words in the individual’s idiolect. He takes language to be a partly social phenomenon not just because it is learned and used in a social setting but because the meanings of a person’s words depend on the way others in their linguistic community use them. He agrees with Chomsky that the study of language is a project for individual psychology, but he argues the semantic facts about an individual’s idiolect depend essentially on their relations to other language-users. To establish that meaning must be individuated nonindividualistically and that idiolects are to some extent social, Burge (1982) constructed a famous thought-experiment in which there is an individual who uses the word ‘arthritis’ to express a number of thoughts about pain in their joints. One day they declare ‘I have arthritis in my thigh’. Since the community the individual belongs to uses the word to apply only to inflammation of the joints, what the individual says is false. Burge then asks us to consider a counterfactual situation in which the community the subject belongs to uses ‘arthritis’ to apply both to inflammations of the joints and to other rheumatoid ailments. In this counterfactual situation there is no change in the individual’s physical history or nonintentionally characterized experiences, and yet the statement they make there is true not false. Burge invites us to share the intuition that the truth-value of what is said differs in the two situations because something different is meant in each context. He concludes that meaning of the word ‘arthritis’ on the speaker’s lips is different in each of these situations because of the different linguistic communities to which they belong. By this argument Burge hopes to show that the meanings of someone’s words are individuated not just by facts about the individual but also partly by facts about the uses of words in the wider linguistic community (see Content: wide and narrow). In this way, the meanings of many words in a person’s language are not just up to him but depend essentially on the linguistic practices of others around him. But what is it for a speaker to belong to a particular linguistic community? For Burge it is a matter of his deferring to members of that community to explicate the meanings and determine the reference of his words on what are cognitive and not just pragmatic grounds. If Burge is right, facts about the meaning of our words supervene not only on facts about our use of words but also on facts about other people’s usage. This amounts to a strong claim that social factors are constitutive of meaning and hence of language and that, although language is a matter of individual psychology, it is also partly a social phenomenon.

Lassalle, Ferdinand (1825-64)

Ferdinand Lassalle was one of the principal founders of German social democracy and a strong advocate of state socialism. He was associated with Marx, although he was not himself a Marxist but rather a radical philosophical idealist in the Hegelian tradition.

Ferdinand Lassalle was born in Breslau, the son of a wealthy Jewish merchant. He was involved in the abortive revolution of 1848 and was imprisoned for six months. A restlessly active man, he devoted much of his life to political agitation and to prosecuting the case of his friend, the Countess Sophie Hatzfeld, against her estranged husband. In 1863 he founded the General German Workingmen's Association, a political party unmistakably socialist in orientation. In 1864 he was killed in a duel.

Lassalle was acquainted with Marx and Engels and was influenced by their work, although not to the exclusion of other thinkers. Indeed, the doctrine he finally advocated was a collection of points drawn from a variety of sources and welded together to produce what many regarded as a strikingly original result. The centrepiece of his economic theory was 'the iron law of wages': market forces would inexorably depress wages to the 'physiological minimum' necessary to keep the workers alive. The solution to this unsatisfactory situation was, he argued, to establish producers' cooperatives through which the workers, by becoming their own employers, could remove themselves from the labour market, thus nullifying the effect of the 'iron law'. For this, and for his other economic doctrines, Lassalle was indebted chiefly to Malthus and Ricardo. His political views, however, he drew from the German philosophical idealists. From Fichte he took the idea of a German nation, now divided, but destined to become a single state with a unified territory; and from Hegel he took his view of the state as the necessary instrument for 'the elevation and development of the human race into freedom'. It followed from this that the real enemy of the industrial proletariat was not the state but the liberal bourgeoisie, together with all those who, by endorsing the capitalist market economy, had ranged themselves against the proletariat as 'one reactionary mass'. The party of the proletariat should, therefore, form a tactical alliance with the Prussian state. The basis of the alliance would be that the party would support the state against liberal opposition and help promote a 'Prussian' solution to the problem of German unification, in return for which the state would implement democratic reforms, in particular universal franchise, and provide financial support for the establishment of producers' cooperatives. In short, the ultimate objective would be a united German state with a democratic constitution and a socialist economy. It was an ingenious strategy, much of which commended itself to Bismarck, and most of which infuriated Marx.

Lassalle's earliest significant work was a study of Heraclitus (1858). It was basically a Hegelian interpretation and caused something of a stir at the time. However, it is no longer referred to by classical scholars. His other major works include his *Das System der erworbenen Rechte (System of Acquired Rights)* (1861), which features an attempt to show that, in certain cases, retrospective legislation is compatible with the idea of right as such, and his *Bastiat-Schulze* (1864), a polemic against the liberal economist Franz Hermann Schulze-Delitzsch.

Latin America, colonial thought in

Colonial refers to Spanish and Portuguese sovereignty in America from the arrival of Columbus in 1492 up to the emergence of modern Latin American states in the nineteenth century. The intellectual life of the colonies and their mother countries at that time falls into two phases: traditional and modern. The traditional phase includes the siglo de oro*, or the Golden Age of the sixteenth and seventeenth centuries. This was a time when literature and the arts flourished, along with Scholastic philosophy, jurisprudence and theology. During the eighteenth century, traditional thought gradually gave way to modern movements, particularly from France.*

The universities founded in the mid-sixteenth century, notably those of Mexico and Peru, as well as colleges and seminaries, were impressively productive in the area of philosophy. The pressure of events such as the clash between European and Native American cultures in the sixteenth century and the struggle for independence from Spain and Portugal in the nineteenth century brought about numerous nonacademic works with philosophic content. Authors wrote in both Latin and Spanish or Portuguese and often knew native languages, such as Nahuatl and Quechua as well. Many operated in several different areas, such as the nun, Sor Juana Inés de la Cruz, one of the greatest poets in the Spanish language, who wrote a book on logic in Latin, which has since been lost.

Students studied philosophy first, then specialized in medicine, law, or theology. The core philosophy curriculum was logic, natural philosophy or physics and metaphysics. In the eighteenth century Scholastic logic, similar to what has come to be known as formal logic, was weakened and natural philosophy began to incorporate experimental science. The bulk of philosophy was affected by modern thinkers such as René Descartes.

Eighteenth-century savants were critical of Scholasticism and later Latin American intellectuals tended to disavow the entire colonial past. However, historians since the 1940s have stressed the currency of modern scholarship, especially in science and since the 1960s have been rediscovering the sophisticated philosophy of the Golden Age.

1 Issues of the conquest

Contact between Spain and the Indies gave rise to a vast body of literature, including accounts of the conquest from both the Spanish and Indian viewpoints, studies of native culture, language and history and plans for new types of communities. Mexican bishop Vasco de Quiroga, for example, used ideas from Thomas More's *Utopia* (1516) to design settlements, or *congregaciones* for Indians dispersed or decimated by disease or mistreatment. These settlements became a model for later communities in Peru, known as *reducciones* and Brazil, known as *aldeias*.

An extraordinary body of writing on ethics, jurisprudence, politics and anthropology developed around the bitter controversies over relations between Spaniards and Indians. The most important figure was Dominican friar Bartolomé de Las Casas. Early in the settlement period a concession system, or *encomienda*, developed allowing Spaniards to force Indians to work on farms and in mines in return for fair treatment, which they usually did not receive. Las Casas, a Spanish landholder, or *encomendero*, in Cuba, heard a sermon denouncing this injustice which led him to free his Indians. He spent the next half of the century defending the rights of both native and African people. In carefully reasoned writings in Latin and Spanish he stressed that cultural differences do not suppress human rights. He questioned whether natural law supported the claims of the Crown, which caused him to advocate Spain's withdrawal from the Indies. Along with his fellow Dominican Francisco de Vitoria in Spain, Las Casas made an important contribution to international law.

2 Philosophy in the colonies

The bulk of colonial philosophy was done by members of religious orders. Each of these orders pursued its own traditions. Franciscans followed John Duns Scotus, while Dominicans, Augustinians and Jesuits developed their interpretations of Thomas Aquinas. In the eighteenth century, Jesuits and Oratorians were key figures in bringing modern philosophy and science to America. American Scholastics remained in close contact with their European colleagues, although seventeenth-century Peruvians complained that Europeans paid their works scant attention.

The most important philosophical sources in the colonies were textbooks published by professors and manuscript classnotes taken down by their students. Other materials included academic programmes which listed the *theses*

participants defended publicly. These are useful in tracing the progress of modern ideas. (A thesis on methodic doubt, for example, showed that Descartes was being discussed.) Theological works also contained philosophical material. A work on theology by Chilean Franciscan Alfonso Briceño included a series of excursuses on metaphysics.

Philosophy textbooks were known as commentaries or (from the seventeenth century) *cursus philosophici* (philosophy courses). Authors mostly used Aristotle's works as a framework to cover the assigned subject and to contribute to debates current at that time. In the eighteenth century, headings were added in modern works to accommodate new interests in methodology, science, mathematics and ethics.

Logic was taught in two parts. Formal, or the 'lesser' logic was called *summulae*, since it surveyed the *Summulae logicales (Summary of Logic)* of thirteenth-century logician Peter of Spain. The 'greater' logic followed the structure of Porphyry's *Isagōgē* on universals and the 'predicables', of Aristotle's *Categories* and *Posterior Analytics*, and often of his *Topics* and *Sophisms* (see Aristotle §§1, 7; Porphyry).

3 Philosophers

Augustinian friar Alonso de la Vera Cruz began teaching philosophy in Mexico in 1540 and published the first work (1554) on the subject in the western hemisphere, a two-volume logic book. He also wrote on natural philosophy and current issues and studied the Tarascan language. Dominican Tomás Mercado included in his logic his own translation of Greek texts of Aristotle (see Mexico, philosophy in).

After teaching in Mexico for sixteen years, Jesuit Antonio Rubio wrote what he hoped would become standard university textbooks in the three core areas of philosophy. His greater work of logic appeared in eighteen editions, between 1603 and 1641, seven of which were dubbed the *Logica mexicana* and became the official textbook in the Spanish University of Alcalá. Four of his works on natural philosophy went through over thirty-five editions. His metaphysics was never published (and is lost). It was, perhaps, eclipsed by Francisco Suárez's *Disputationes metaphysicae (Metaphysical Disputations)* (1597) (see Suárez, F.). Rubio's works appeared in over fifty editions in six European countries. He also found time to study the language of the Aztecs.

The logic of Franciscan Jerónimo de Valera, published in Peru in 1610, was the first philosophy book printed in South America. Peruvian Jesuits Alonso Peñafiel, Nicolás de Olea and José de Aguilar published full courses on logic, natural philosophy and metaphysics.

Juan de Espinosa Medrano (*c*.1633-88), known as El Lunarejo, was professor of philosophy and theology in Cuzco, Peru. In his day, he was active in literary and philosophical controversies. His defence of poet Luis de Góngora holds a place in Spanish literary criticism. He was also famous for his eloquence not only in Spanish and Latin, but Quechua, the language of the Incas, in which he composed a biblical play set in Peru. He wrote his (lesser and greater) logic to defend traditional positions against a philosophical rebellion in seventeenth-century Spain which reflected modern impatience with conventional thought. His logic contains an unusual defence of Platonic ideas (see Plato).

Although eighteenth-century philosophers were critical of previous Scholasticism, they usually blended it with modernism. Franciscan José Elías del Carmen Pereira in Argentina is an example of this eclecticism. The Jesuits had founded the University of Córdoba early in the seventeenth century and taught traditional Scholasticism using Rubio's logic as a textbook. By the mid-eighteenth century, conservatives complained that 'anti-Scholastic' doctrines were being taught. After the Jesuits were expelled from the region in 1767, the Franciscans, including Pereira continued their modern tendencies. The manuscripts of his course on natural philosophy dating from 1784 are extant.

Other representatives of the modern movement are José Agustín Caballero in Cuba, Isidoro de Celis in Peru, Jesuit Diego José Abad in Mexico and Oratorian Juan Benito Díaz de Gamarra y Dávalos. Well-known scientists, mathematicians and historians included Carlos de Sigüenza y Góngora in Mexico and Pedro Peralta Barnuevo in both Mexico and Peru.

4 Formal logic

Sixteenth-century Scholastic logicians at the time of Alonso de la Vera Cruz analysed sentences in several ways.

One way, still used in logic, would be to see a sentence like ‘Bossy is a cow’ as attributing the feature of being a cow, signified by the general term ‘cow’, to the thing denoted by the name ’Bossy’. However, they often took what logicians of the twentieth century would term a ’many-sorted’ approach, wherein they reduced sentences containing general terms to sentences having only terms for things. ’Bossy is a cow’, therefore, would be equivalent to a disjunction (a sentence made up of smaller ones joined by ‘or’): ‘Bossy is this cow *or* Bossy is that cow’. Deictic terms like ’this cow’ they called ’wander terms’. Alonso took the disjunction to be true when at least one of the sentences it comprised was true, so that ’Bossy is a cow’ is true when at least one cow is Bossy. On the other hand, ‘Bossy is not a dog’ would be analysed as a conjunction (a sentence made up of smaller ones joined by ‘and’): ‘Bossy is not this dog *and* Bossy is not that dog’. A conjunction is true when every sentence it is made up of is true. A universal sentence like ‘every cow is an animal’ is analysed as a conjunction of disjunctions: ‘this cow is this animal *or* this cow is that animal …*and* that cow is this animal *or* that cow is that animal …*and*’.

Alonso (1554) and his colleagues formulated rules to expand general sentences into disjunctions and/or conjunctions (’descent’) and from these to derive general sentences (’ascent’ or ’induction’). In fact, they defined quantification (words like ’every’, ’any’, ’some’) by means of these rules. They used such procedures to study many kinds of sentences: nonstandard quantification (’Fido is not every dog’), relations (’Peter and Paul are discussing’, ’every cow belongs to some man’), modality, the notions of possibility and necessity (’Fido need not wag his tail’) and many others.

Alonso’s definition of conjunctions and disjunctions is truth-functional: the truth of a compound sentence depends on the truth or falsehood of its parts. He takes the normal case of a conditional sentence like ’if Bossy is a cow, she is an animal’ as ’strict implication’, to use a twentieth-century expression, that is, it implies necessity: ’Fido cannot be a dog without being an animal’.

In general, Golden Age logic was quite similar to logic today and is often especially interesting where it differs (see Logical and mathematical terms, glossary of).

5 A theory of science

In his *Commentarii in universam Aristotelis dialecticam (Logica mexicana)* (1603), Rubio worked out a partially original theory of the relation of logic to science. Ideally, a science is an axiom system, a structured network of inferences resting ultimately on axioms. Science is general: it is not merely about *this* animal but about *animal* as such. Science is necessary in the sense that it seeks to describe physical law. A science aims at identifying the properties, or *passiones*, of its subject matter. In biology, for example, a statement would attribute the property, say, of *having DNA* to animals. Scientists must also be logicians, who use logic in two complementary ways. From a stock of terms, they construct sentences, link them together to form inferences and finally shape the inferences into a system. This is the practical or constructive (*compositorius*) side of logic. Its theoretical or analytic (*resolutorius*) function comes into play when they trace the paths of inference back to the axioms and break up statements into their constituent terms.

Logic itself is a science, hence an axiom system comprising terms, sentences, inferences, as well as a necessary structure. But to Rubio, it is unique because its subject matter is ultimately the same as that of all the sciences and is constructed without any subject matter. (Later logicians use variables to bracket out what is not of logical interest.)

Rubio defined the entities logic deals with in terms of relations and converse relations. The above construction and analysis, for example, are the two sides of a *making up* relation. In construction, terms make up statements, statements inferences and inferences are bound together into a system. Analysis is the converse relation of *being made up of*: the network is made up of inferences, these of statements and statements of terms. Another example of relations and converse relations is the predicate and subject of a sentence. A predicate is the relation of *being stated of* and a subject is the converse relation of *being what something is stated of*. These relations are the properties that logic as a science studies and seeks to identify in scientific discourse. The scientist says ’animals have DNA’, but the logician says ’*having DNA* is a predicate’, that is, ’*having DNA* is stated of something (animal)’. In other words, the scientist attributes the logical property of *being a predicate* to the ’thing’ *having DNA*. However, science and logic deal with different sorts of properties. *Having DNA* is a real property since it belongs to things in the world like Bossy and Fido. But a logical property like *being stated of* applies only to

’things’ in the mind, like *having DNA*. Logical properties are ’of second intention’ (’higher level’ would be a twentieth-century expression), since they apply to things as known and they are ‘mental constructs’ (*entia rationis*) in the sense that they do not really apply to them.

Rubio’s theory of logic can be formulated in the following way: logic studies and in some sense constructs higher-level relations and attributes them to entities studied by other sciences. In turn, these entities apply to concrete things.

6 A defence of Plato

Juan de Espinosa Medrano (1688) developed an original defence of Plato with regard to his treatment of the problem of universals. The issue, then as now, has to do with explaining the nature of the general features of things. Logicians say that Fido and Bossy have the universal feature of *having DNA*. Fido and Bossy are concrete things, but what is *having DNA* the universal quality that they share? Thomists (followers of Thomas Aquinas) and the Scotists (followers of John Duns Scotus), grouped together by Espinosa as *peripatetics*, usually rejected nominalist and psychologistic solutions that universals were simply the words or the thoughts of a person. Peripatetics held several varieties of realism, according to which universals, or essences, are somehow more than mere words or private thoughts. However, all peripatetics routinely rejected what they took to be Plato’s theory, which claimed that universals, or ideas, exist *apart* from the concrete, singular things which embody them.

Espinosa wanted to know what peripatetics meant by realism. He carefully isolated the elements found in both Thomist and Scotist theories and came up with a common peripatetic definition of essence. Both theoretical branches claimed, for example, that universals have essential being, that is, they exist as essences, that they do not change, are independent of time and space and, most importantly, that they differ both from concrete things and from God. Espinosa went on to analyse Plato’s position. First, he questioned the usual Neoplatonic and Aristotelian interpretations of ideas: that they are (an aspect of) God or they exist by themselves apart from things. Espinosa believed that, if we judge by Plato’s aim, which was to identify the object of knowledge, then he had only to describe his ideas as the peripatetics described their essences; in other words, what Plato said about his ideas was already *included in* what peripatetics said about their essences. Therefore, if peripatetic essences do not exist apart from things, neither do Platonic ideas. Espinosa did not infer from Plato’s words that ideas do or do not exist apart. What is clear is that ‘the peripatetics, willing or not, have platonized and wounded themselves as they attacked Plato’ (1688: 67) (see Neoplatonism). Espinosa stressed that his interesting claim ’has not been put forward until now, as far as I know, although (fifteenth-century Dominic of) Flanders and (contemporary Francisco) Araujo have favoured it in part’ (1688: 62). The essences he described are not unlike twentieth-century abstract entities. Although Espinosa was aware of their ambiguous ontological status, he thought the objections against them could be resolved.

Scholastic rebels of his time, especially a group of Spanish Jesuits, had nominalistic tendencies which Espinosa attacked fiercely. His arguments, he believed, finally put nominalism to rest, after outbreaks of the doctrine during the Greek period (Heraclitus (*c*.540-480 BC)), in the twelfth and fourteenth centuries (Roscelin (*c*.1050-after 1120) and Ockham (*c*.1287-1347)) and during the seventeenth century, in Espinosa’s own time (see Heraclitus; William of Ockham; Roscelin of Compiègne). Indeed, it was he who wrote nominalism’s epitaph:

> Thrice slain and then revived, I, Ockham’s sect, A fourth time now follow Euridice; Lo, here I helpless lie among the shades: A word, a concept, sans reality.
>
> (1688: 128)

7 Natural philosophy in the eighteenth century

In his course on natural philosophy or physics Elías del Carmen Pereira (1784) blended modern science and traditional philosophy. He took his ideas from Scholastics such as Anselm of Canterbury, Aquinas, Duns Scotus, Suárez, modern philosophers, such as, Francis Bacon, René Descartes, Pierre Gassendi, Baruch Spinoza and G.W. Leibniz, modernizing Scholastics, such as, Benito Jerónomo Feijoo, Teodoro Almeida and Tomás Vicente Tosca and scientists, such as, Robert Boyle and Torricelli. Pereira’s favourite topics were scientific: the vacuum, capillary action, motion, gravity and light. However, he continued to work within the traditional conception of science, as can be gathered from his definition of general physics as the natural body and its properties.

Pereira's use of the traditional categories of matter and form was an example of an old theory disguised as a new one. He claimed to be following the example of the more cultivated nations in his refusal to quibble over prime matter, defining matter as extended particles, which, 'whatever they are', are physically, but not mathematically indivisible, and are formed in various sizes and shapes. The form of a material thing became the manner in which material particles combined, with their relationship giving rise to the specific properties of the material thing.

Pereira framed his theory of light in traditional terms of substance and accident, matter and form. Light, he believed, was not an accident of matter as the Scholastics thought, but a substance and that the effluence theory of Newton and Gassendi was also wrong (see Newton, I.). Taking his lead from Nicolas Malebranche, Pereira claimed that the 'matter' of light is the medium wherein it is propagated, that is, the ether which consists of tiny contiguous elastic globules. Its 'form' is the rapid vibratory motion transmitted instantaneously from one particle to another in straight lines. In this particle-wave theory, the globules themselves do not move away from the light source and their vibration has frequency, but little or no amplitude.

Despite his Scholastic vocabulary, Franciscan Friar Elías del Carmen Pereira's world was no longer that of the Scholastics.

Latin America, philosophy in

Geographically, Latin America extends from the Mexican-US border to those regions of Antarctica to which various Latin American countries have laid claim. It includes the Spanish-speaking Caribbean. Philosophy in Latin America dates from pre-Columbian (before 1492 in Hispanic America) and precabralian times (before 1500 in Brazil). Autochthonous cultures, particularly the Aztecs, Mayas, Incas and Tupi-Guarani, produced sophisticated thought systems centuries before the arrival of Europeans in America.

Academic philosophy began in the sixteenth century when the Catholic church began to establish schools, monasteries, convents and seminaries in Latin America. The seventeenth century saw little philosophical activity as effort was made to use academic thought to maintain the status quo, which reinforced a basically medieval worldview. Intellectually, the eighteenth century perpetuated this calm traditionalism until mid-century when a generation of Jesuits tried to break with the thought of Aristotle in order to modernize it. Political turmoil prevented academic philosophy from broadening in the early part of the nineteenth century. Later in the nineteenth century and into the early twentieth, positivism eventually became entrenched in most Latin American countries. In the early twentieth century new intellectual movements began as a backlash against anti-positivism.

1 Latin American philosophy up to the nineteenth century

Indigenous cultures, particularly the Aztecs, Mayas, Incas and Tupi-Guarani, produced interesting and sophisticated thought systems centuries before the arrival of Europeans in America. Many cultural artefacts were lost or destroyed so that study of this period involves many challenges in deciphering the subtleties and complexities of the earliest thought in Latin America. Indigenous cosmologies were often linked to phenomena in the natural world (see Latin America, pre-Columbian and indigenous thought in; Brazil, philosophy in).

Academic philosophy grew up in the sixteenth century when the Catholic church began to establish schools, monasteries, convents and seminaries in Latin America. If the encounter with the New World had significant impact on the European mind, this was not initially reflected in the philosophy being taught and written in the sixteenth and seventeenth centuries, which tended to restate and reinforce medieval values. However, intriguing writings on ethics and jurisprudence grew out of the contact between Spain and Latin America. Essentially, these writings analysed the relationship between cultural differences and human rights. The Dominican friar Bartolomé de las Casas was a pivotal figure who defended the rights of native and African peoples living in the Indies in the sixteenth century (see Latin America, colonial thought in; Mexico, philosophy in).

With a few notable exceptions, the seventeenth century was largely moribund philosophically because most efforts were directed towards using academic thought to maintain the status quo, which reinforced a fundamentally medieval worldview. The main philosophical task involved justifying and protecting the Catholic faith against Protestantism and science. Scholasticism was the dominant trend. However, there were some exceptions to the dominant practices in the form of several remarkable historical and philosophical figures. Antonio Rubio’s studies on logic are remarkably advanced. Juana Inés de la Cruz had a brilliant philosophical mind and is usually considered one of the earliest feminist thinkers in America (see Latin America, colonial thought in; Feminist thought in Latin America).

Intellectually, the eighteenth century continued this calm traditionalism until mid-century when a generation of Jesuits tried to break with the thought of Aristotle and bring philosophy into ’modernity’. They were primarily influenced by post-Renaissance Italian and French philosophy. However, the Jesuit order was expelled from the Spanish-speaking world in 1767. This delayed the introduction of proto-modern European philosophy in Latin America. The eighteenth century has become the subject of much revisionist philosophical study, particularly in Mexico (see Mexico, philosophy in).

Academic philosophy still did not broaden in the early nineteenth century because of political turmoil both in various Latin American countries and in Europe. Universities occasionally closed. This inhibited academic philosophical progress as universities were the locus of much philosophical activity. A more productive forum for philosophy was often the political arena in which thoughtful essays of ideas were written by nonacademics on themes such as constitutional government, progress and autonomy (see Literature, philosophy in Latin American;

Argentina, philosophy in).

Later in the nineteenth century and into the early twentieth, positivism eventually became entrenched in most Latin American countries. This movement claimed to be an objective methodology of the sciences. It was widely believed that scientific doctrines could provide the most efficient management of society through educational and political reforms. Auguste Comte and Herbert Spencer were the primary positivist influences in Latin America (see Positivist thought in Latin America; Analytical philosophy in Latin America; Brazil, philosophy in).

2 Latin American philosophy in the twentieth century

In the early twentieth century new intellectual movements began. Arising from these was a strong, thoroughgoing anti-positivist backlash. Ideas that positivists had promoted as ’scientific’ were rejected by anti-positivists for being scientistic (see Anti-positivist thought in Latin America; Argentina, philosophy in). Philosophers entertained idealism, vitalism, pragmatism and various political and social philosophies (see Phenomenology in Latin America; Existentialist thought in Latin America). Neo-Thomist thought continued to be widely studied, primarily in the Catholic universities.

A focus on regional thought in Latin America was an outgrowth of anti-positivist thought and a consequence of the arrival of Spanish philosophers who were exiled after the fall of Republican Spain. The writings of the Spaniard, José Ortega y Gasset, were widely influential in shaping Latin American philosophical reflections. Philosophers addressed the question of authenticity as they explored whether Latin Americans were simply adopting European philosophies, or whether they themselves had any authentic philosophy to offer. Many concluded that Latin Americans were adapting, rather than adopting European philosophies to their own reality (see Existentialist thought in Latin America; Phenomenolgy in Latin America; Anti-positivist thought in Latin America).

This process of critical self-examination, or ’autognosis’, was twofold. First, philosophers in individual countries and regions of Latin America sought to identify what was unique or distinctive about their thought or being. Later, philosophical contributions made by Latin America as a whole were compared and contrasted with those of other regions in the world (see Argentina, philosophy in; Brazil, philosophy in; Mexico, philosophy in). Studying Latin American thought in comparative perspective engendered a debate of considerable longevity over whether ‘Latin American philosophy’ exists or whether ’philosophy in Latin America’ is a more accurate denotation. Every Latin American country, including Puerto Rico, can be argued to possess unique philosophical traditions. At the same time there exists an extensive body of argument and commentary on what kind of philosophy, if any, can claim to be ’universal’.

Since analytical philosophy presents perspectives, methods and projects which claim to have universal appeal and applicability, it is often embraced in academic circles and is most frequently entrenched institutionally in Mexico, Brazil and Argentina. Analytical philosophy in these countries, while not obviously a response to immediate regional social, political or economic circumstances, serves to include and validate its adherents in international circles by adopting a style widely practised and accepted by mainstream Anglo-American academic philosophy. Attracted to the linguistic ’rigour’ of analytical philosophy, some adherents claim that it is the only way to do ’real philosophy’.

The late twentieth century reveals that it is possible to speak of both ’Latin American philosophy’ and ’philosophy in Latin America’. Some areas of philosophical research imbued with regional and cosmopolitan appeal are cultural identity, feminist thought, liberation philosophy, marginality and Marxist thought in Latin America (see Cultural identity; Feminist thought in Latin America; Liberation philosophy; Marginality; Marxist thought in Latin America). Many of these areas are profoundly engaged with Latin American realities in historical context. Rather than blindly adopting canonical Western philosophical paradigms, writers in these traditions seek to broaden the definition of what is human by convincingly articulating and incorporating Latin American experience and values into both the crucial discourses of philosophy and the pressing themes of the modern world (see Marginality).

Marxist philosophy has been and most likely will continue to be significant in Latin America partly because of continuing problems of economic disparities. Concerns with retributive justice, human rights and issues of power and truth, as well as the belief that Marxist theory more accurately describes reality, contribute to the vitality of this thought. Despite the collapse of the Soviet Union and the passing of Maoism in China, for many the Cuban

Revolution of 1959 is still idealized because it continues to threaten the US ’monster’ to the north, while advancing the notion of a supportive, egalitarian and responsible community. The Peruvian José Carlos Mariátegui was an original Latin American Marxist thinker whose thought has generated interest and respect internationally (see Marxist thought in Latin America).

One of the best known and most interesting contributions of modern Latin American intellectual life is liberation philosophy. The philosophical movement originated in Argentina, although many of its practitioners reside in other Latin American countries (see Argentina, philosophy in; Mexico, philosophy in). Philosophy of liberation should not be confused with liberation theology (see Liberation theology). Philosophy of liberation attempts to explain philosophically the theoretical underpinnings of social and political phenomena, such as dependency, and reinforces theology of liberation. These movements are responses to significant events in twentieth-century Latin America such as the Cuban Revolution (1959), the Argentine ‘Dirty war’ (1976-1983) and repressive regimes which began in Guatemala in 1954, Brazil in 1964 and Chile in 1973. Other political topics for these writers included populism, Marxism and Peronism. Philosophy of liberation differs from theology of liberation, Latin Americanist philosophy and Marxist philosophy especially in terms of its more limited accessibility. Philosophers of liberation employ a complex and specialized vocabulary which requires initiation on the part of readers. In addition, philosophy of liberation is not a unified movement: it is more appropriate to speak of philosophies of liberation. Such fragmentation in this field can be partly explained by the political orientations of thinkers whose views range from the extreme left to the extreme right. Their philosophical influences vary widely and include Francophone, German and other Latin American thinkers.

Philosophical activity in Latin America is characterized by a tremendous diversity of focus and methodologies. Latin Americans are keenly aware of philosophical developments in the rest of the world and thus entertain a variety of philosophical stances: progressive and conservative, pragmatist and idealist, materialist and spiritualist. Numerous philosophical interests and projects exist in Latin America because of a diversified and active philosophical profession, an interested public, some government support, a cultural awareness of other continents among the educated and noneducated alike and a widespread faith in education as a key to development.

AMY A. OLIVER

Latin America, pre-Columbian and indigenous thought in

The term 'pre-Columbian thought' refers to the set of beliefs and ideas held by the civilizations existing in Latin America prior to the arrival of Columbus in 1492. Research in pre-Columbian thought poses several questions linked to language, interpretation, chronology and cultural diversity. They can roughly be organized according to the three main regions in which the indigenous cultures flourished upon the arrival of the Spanish invaders: Nahuatl/Aztec *in central and southern Mexico,* Quiché/Maya *from Yucatan in southern Mexico to Honduras in central America and* Quechua/Inca*, from Ecuador to northern Chile. They each correspond to an empire into which previously many diverse, distinguishable peoples were assimilated. Since the Spanish invaders had destroyed most of their 'heretical' cultural objects by 1550, the question arises whether an accurate knowledge of their thought can be obtained.*

Some ethnohistorians believe that each of the aforementioned cultures developed a hieroglyphic system of codification and documentation, called Codices*, to preserve their theocosmogony, history and wisdom. Since the sixteenth century, however, it is known with certainty that only the Aztec and Mayan cultures developed such a system. According to some historians, the Incan culture did not use any kind of writing. They probably created 'paintings', as the Spaniards called their hieroglyphs, but these were totally destroyed.*

It is known that all pre-Columbian religions worshipped the events and forces of nature. The term used to name them was translated into Spanish as 'gods' when they were acceptable, or 'demons' when they seemed heretical - the indigenous peoples were polytheistic. The gods did not dwell in a region beyond our world, but rather populated it and were actively intertwined with it. All pre-Columbian cultures believed the sun to be the highest deity. The universe was conceived as a holistic structure in which human life, society and the gods were parts of an interrelated universe. Beyond these, however, the three cultures believed in an intangible, abstract deity, or principle, which ruled above all others.

The sun, being the highest tangible deity, led the priests of these cultures to observe the skies. Based on a highly developed knowledge of astronomy and mathematics, they established an accurate solar calendar.

1 Sources

In opposition to the colonizers of the USA and Canada, the Spanish invaders of the first generation (up to 1550 AD) described in great detail the cities, temples and well-organized commerce and transport systems they encountered. They were awed by the magnificence of the civilizations they discovered in Mexico, as expressed by Hernán Cortés (*c*.1485- *c*.1547) and Bernal Díaz del Castillo (d. *circa* 1560). Since they did not know the pre-Columbian languages and were both biased by the beliefs of their own age and culture and blinded by their greed for gold and silver, they did not collect direct information about the beliefs and thought of the original inhabitants. The recording of these beliefs became the task of some of the first Franciscan missionaries in Mexico and Guatemala. Bernard Sahagún (d. *circa* 1590) termed this set of beliefs 'philosophy' and Diego de Landa (1524-79 [1978]) called them 'heresy'.

Contemporary research on the pre-Colombian cultures relies on a variety of sources: first, archaeological excavations of ancient cities, temples and reliefs, sculpture, figurines and pottery; second: with regard to the Aztec and Mayan culture, codices, which are figurative, polychromatic manuscripts drawn by Indian priests; third: manuscripts dictated by converted Indian nobility, which then were translated into Latin, or else they were transliterated by Indians from the indigenous languages with the use of the Latin alphabet. (The Aztecs spoke, among other languages, Nahuatl or Mexica; the Mayas spoke, among other languages, Maya-Quiché.) All the codices depict themes inherited by the oral tradition: theocosmogony, history, religious ceremonies and social mores. Other sources include chronicles and histories written in Spanish by missionaries.

Research on Mayan thought differs from that on the Aztecs and Incas in that many of the codices depicting texts have not been completely deciphered. However, their numerical system (which was not decimal but vigesimal) has been well understood. Mayan priests, who were also mathematicians, conceived of the number zero prior to the arrival of the Spaniards. Remaining texts, such as the *Popol Vuh* (*c*.1600 [1996]) and *The Book of Chilam Balam of Chumayel* (*c*.1600 [1967]), were written in the Maya/Quiché language using the Latin alphabet. They have since

been translated into Spanish and other languages. They record Mayan cosmogony, the history of their cities, astronomy and astrology.

The only Inca codex to be found was the *quipu*, a sort of rosary or abacus made from hemp and beads. This was designed for purposes of numerical information. Research on Inca culture has mainly been obtained from massive monuments, such as the old cities of Macchu Picchu and Cuzco, with their observatories for recording the movement of the sun, moon and stars. Archaeological digs have led to the retrieval of pottery, jewellery and mummies that escaped the Spanish destruction. The oral tradition has also helped to maintain Inca history. In its technical capability, Incan culture has been compared to that of the Roman Empire. The Incas built an elaborate system of channels to capture the melting snow from the slopes of the Andes and to transport it to the valleys where they had settled, some of which are still in use in the 1990s. Similarly, they built a road system extending from the sacred city of Cuzco, which for the Incas was the centre of the universe, to the four cardinal points - north, south, east and west. In the coastal plains huge geometrical figures have been found, whose shape and size can be appreciated only from the air and no one has been able to interpret their function and meaning. In addition and most important, are several manuscripts written in Spanish by converted Inca noblemen, for example Diego de Castro Tito Cussi Yapanqui (*c*.1529-71) and Felipe Guamán Poma de Ayala (*c*.1550-*c*.1615 [1977]). They tell us that the last Incan emperor Atahualpa, ruler at the time of the arrival of the Spaniards and killed in 1533 by the conqueror Pizarro, established a ‘clock’ by which he determined the period of preparing the soil, seeding and harvesting.

2 Worldviews

As to the thoughts and worldviews of these cultures, it is difficult to form a clear and distinct conception due to the problem of language. The first translators, the Spanish Catholic friars, came to the New World to convert the original peoples to the ‘true religion’ during the century when Spain was dominated by the Counter-Reformation. These friars had been trained in the medieval Aristotelian view of both the true God and the world, and their descriptions mirrored this background. For instance, Bernabé Cobo, a missionary travelling in Peru, appalled by the Indians’ idolatry, referred to the sacred sculptures and figurines as ‘demons’. Newly converted Indians and several friars used the term ‘god’ as a translation of the names given to the various images representing the forces and events of nature.

According to Miguel León-Portilla (1963), the Aztec peoples had a precise conception of a metaphysical God despite their belief in a variety of deities corresponding to natural recurrent events, such as the recurrence of the moon and the sun and the cycles of planting and harvesting. All the deities, both feared and revered, were thought to be manifestations of a single supreme intangible, immaterial principle endowed with diverse attributes and present in all phenomena. Its name was Ometeotl, the god of duality and wisdom. As duality, he was partially male and female. His male name was Ometecutli, ‘he… who is activity on earth’ and his wife Omecihuatl, she who ‘gives stability to (our) earth’, as translated by León-Portilla (1963). These two notions are conceived as a unity which comprises everything by virtue of being dual: dark and light, masculine and feminine, life and death. One of Ometeotl’s attributes is *tloque nahuaque*, or owner of proximity in time and space, who rules over the earth. As a representation of activity and stability, Ometeotl can be interpreted as a dialectical principle which, as activity, is the principle of destruction and recreation, but which, by giving stability to the earth, maintains the world’s continuity. One of the main scholars of Nahuatl culture, Angel María Garibay (1892-1967), translates Ometeotl as ‘two-god’ (*c*.1930 [1965]).

A similar notion of duality can be found in the Mayan religion, where duality is called Hunab-Ku. In its masculine form, it is Itzamna, whose wife is Ix-Chel, or mother earth. They are the ancestors of all other gods and of humans. Reliefs show Itzamna as an old man representing wisdom, life-giving forces and writing. Since Itzamna is wisdom, he ‘knows something about time’. Therefore, he also is the patron of astronomical and mathematical knowledge. Similar to Ometeotl for the Aztecs, Itzamna and Ix-Chel, were conceived as a unity, or single metaphysical principle.

The Incan religion was different. Ticci Viracocha, also called Pachayachachic, was thought to be the creator and ruler of all things. According to Garcilaso Inca de la Vega (1539-1616) in *Royal Commenatries of the Incas and General History* (*c*.1600 [1966]), Pachayachachic is the world’s origin and soul, the giver of life and the mover of the universe. Since this deity is incorporeal, the mind cannot have an image of its being. A person who makes

contact with this god does so through the heart. Therefore it was forbidden to pronounce its name, to build temples dedicated to it and to offer up sacrifices to it. In a sense, Pachayachachic was a hidden god. Below this deity were the diverse Viracochas: the sun, representing agriculture, the earth, representing our mother and minor deities, such as rocks and earthquakes. The Incan emperor and his dynasty were also considered to be divine, but below the higher ranking Viracochas. According to Bernabé Cobo (*c*.1550 [1990]), one of the early missionaries in Peru, Ticci Viracocha was the highest deity, or as Cobo states, the first cause.

There is the question of whether the pre-Columbian peoples were polytheistic. Some interpreters claim that the Aztec and Mayan gods are images and should not to be understood as personifications of natural events and forces, but rather as ideas of them. The Aztecs called the regular appearance of the sun *tonatiuh*, meaning the main star in the sky; the Quechuas called it *apu inti*. The idea of the sun as the giver of life and the deity which keeps the sun, understood as the soul of the world moving, amounts to the same unique first metaphysical principle. Therefore, the first bishop of Guatemala and Chiapas, Fray Bartolemé de las Casas called these religions monotheistic.

With regard to their view of the universe, the three cultures have astonishing similarities. None of them knew of the existence of other continents. They viewed the universe as divided into four regions, each corresponding to the four cardinal directions. They believed in the existence of a region below our earth, where the dead are buried and survive in the dark. The Aztecs and Mayas, but not the Incas, believed in a recurrent cycle of creation and destruction. The Aztecs measured the universe's time in cycles, known as suns, equal to fifty-two years after which, due to a cosmic cataclysm, the universe would be destroyed, and accordingly recreated.

3 Three sages

León-Portilla (1963) translated works from Nahuatl into Spanish. He interpreted the poems of the most representative sages and priests, or *tlamatimine*, meaning 'he who knows something'. Counted among these sages were Quetzalcoatl, or the 'plumed serpent' (ninth century AD), probably king of Tula, Tlacaelel, advisor to the king (*c*.1398) and Netzahualcoyotl, king of Texcoco (1402-72).

From Quetzalcoatl we know how the Nahuas, and later the Aztecs, viewed the universe. It was imagined as an enormous is land divided horizontally into four regions surrounded by enormous waters. The four regions converge at the world's centre. East is the region of light, of fertility and of life, symbolized by the colour white; north is the universe's black region, where the dead are buried; west is the sun's house, its colour red; and south is the region of seeds, its colour blue. Vertically, the universe is built in layers, some above, others beneath the earth. Above the earth the sky forms a blue dome covered by a network of paths on which the sun, stars and moon move. At the highest level is Ometeotl, other gods are on lower levels. Beneath the surface of earth there are other levels, the deepest being the region of death, or Mictlan.

Netzahualcoyotl's thought is the best known. Some texts thought to be by Netzahualcoyotl remain, such as *Anales de Cuauhtitlan* (*c*.1402-72). One of the recurrent themes refers to the world's constant flow of time and the never ending change and futility of being. The often used expression *cachuitl*, or 'what is left behind', also refers to death and the sorrow of human mortality. This concern explicitly leads Netzahualcoyotl to reflect on the unique value of human life. Being aware of the inevitability of death, he reflects upon the possibility of overcoming it. He searches for a fixed point which does not change or perish. He sees it in the mystery of *tloque nahuaque*, or 'owner of proximity in time and space', but the mystery can only be invoked, not resolved. This fixed point can only become real if it grows roots in our hearts and the sorrow about death can only be silenced in one's heart, through *flor y canto*, or poetry. As king of Texcoco, Netzahualcoyotl unsuccessfully tried to oppose the practice of human sacrifice, a ritual brought to the land by the Aztecs, also known as Mexicas, the last indigenous group who had conquered the whole region by 1325 AD.

Tlacaelel's thought was the expression of an ideology that justified Aztec political practices. He was an outspoken advocate of the glorification of Huitzilopochtli, the god of war. In order to create the new cycle of life on earth following the last cataclysm, the gods gave their own blood as the elixir of life and strength. To correspond to this sacrifice it was necessary to offer them human blood. In order to have access to this elixir, Tlacaelel supported the practice of regular warfare, or *guerras floridas* against their neighbours for the explicit purpose of obtaining prisoners. This ideology became acceptable because human sacrifices made it impossible for the next cataclysm to happen. Hence, the Aztecs saw themselves as the chosen people who could overcome the inevitable destruction of

the universe.

When the missionaries arrived in the New World, they were appalled by the immorality of the indigenous peoples. Not only were they shocked by the practice of human sacrifices, but also disgusted by the purported custom of eating the flesh of victims. However, cannibalism has been a controversial issue among historians who think it was alleged by the conquerors to justify the appropriation and plundering of the whole territory. In addition, most sixteenth-century chronicles report a variety of ‘sins’ attributed to biblical Babylon from prostitution and incest to homosexuality. It is true that the Incas worshipped fertility and many remaining *huacas*, or sacred figures in clay, are endowed with phallic forms.

Most recently, the opposite view has been taken. As the great empires required the rule of law and discipline, all three cultures were based on similar moral values. The main virtues were courage, fortitude, sobriety and obedience. Drunkenness was regarded as the source of all vices. Monogamy seems to have been the correct relationship between man and woman, since under the Incas adultery, like theft, was punished with death. Greed was condemned and riches in gold, silver and precious stones (and among the Aztecs and Mayas, the quetzal’s colourful feathers), belonged to the gods, their temples and the courts of emperors and priests.

Sahagún (*c*.1550 [1970]) outlined the many virtues an Aztec father taught his children. Both sons and daughters had to worship the gods daily, be diligent in their tasks so that time would not be wasted, be meticulous when carrying out their craft, act friendly and respectfully towards others, keep peace with them, be honest and never steal from them. He taught his daughter to practise chastity and modesty before marriage, to be obedient to her father or husband and to do the work of women, such as cooking, weaving and painting.

In addition, he taught his sons not to act arrogantly, not to sow disharmony, to cultivate the land, to learn an honourable trade or art, to be always modest and enduring and always be responsible for his wife and family.

Latitudinarianism

The term 'Latitudinarianism' designated, initially abusively, the attitudes of a group of late seventeenth-century Anglican clergy who advocated ecclesiastical moderation, voiced broad if heavily qualified support for religious toleration, and emphasized an undogmatic probabilism, 'moral certainty', a reasoned faith and moral performance over against infallibility, dogma, ritual performance and 'unreasoning' faith. They attempted to construct a 'reasonable' faith, with some emphasizing belief in carefully evaluated miracles to attest to the central truths of Christianity. The Latitudinarians had considerable influence on the thought of John Locke, among others, although Locke's anti-clericalism, tolerationism and reticence on the Trinity went beyond their positions. The most important of the Latitudinarians, listed from the most eirenic to the least, were Edward Fowler, Benjamin Whichcote, John Wilkins, John Tillotson, Gilbert Burnet, Joseph Glanvill and Edward Stillingfleet; they were particularly influenced by the thought of William Chillingworth, the Cambridge Platonists and Hugo Grotius.

1 Lives, fallibility and attitudes towards toleration

The Latitudinarians were mainly educated during controversies between Catholics and Protestants over the 'Rule of Faith', during the attempts by many puritans in the English civil wars to impose their own brands of religion on others, backed by the certainties of 'conscience', and during a time when there was a proliferation of sects emphasizing the roles of illumination, grace and private revelation. The Latitudinarians' heroes of this period were eirenic Anglicans such as William Chillingworth and Viscount Falkland who had stressed, in contrast to both Puritans and Roman Catholic controversialists, humankind's fallibility, the need to proportion assent to the evidence, the limited number of fundamentals of Christianity and the legitimacy of differing opinions. Several of the Latitudinarians were, furthermore, taught by the leading Cambridge Platonists and influenced especially by their emphases on reason and morality (see Cambridge Platonism).

The Latitudinarians reiterated many of the positions of Chillingworth, Falkland and the Cambridge Platonists, stressing that the fundamentals of Christianity were clear but should not be specified 'too forwardly', that differing opinions on other issues within Christianity were unavoidable, and that no particular form of church government was required by divine or natural law. They supported accommodating 'a latitude' of different practices and beliefs in a broad church, which they saw as a form of religious toleration, combined - with varying degrees of reluctance - with toleration for those few to be left outside. They supported the toleration provided by the Revolution of 1689 and rose at that point to occupy the highest offices in the Church of England. As Whichcote argued, 'our fallibility and the Shortness of our Knowledge should make us peaceable and gentle: because I may be mistaken I must not be dogmatical' (Ashcraft *et al*. 1992: 236). For Burnet, it was from their allowance of 'great freedom both in philosophy and divinity' that they received the name of Latitudinarians. Their argument that no particular form of church was required by Christianity, their confidence that in fact they reasoned correctly and others were 'enthusiastic' and unreasonable, and their emphasis on peace and the authority of the civil magistrate, were, however, often combined before 1689 with a preference for episcopacy and with an emphasis on the duty to unite in the civilly established church, limiting their tolerationism. The most important works of the Latitudinarians enunciating these principles were Stillingfleet's *Irenicum* (1660) and, far less eirenic, his *Unreasonableness of Separation* (1681), the *Brief Account of the New Sect of Latitude-Men* by 'S.P.' (1662), Tillotson's sermons and especially Edward Fowler's *Principles and Practices of Certain Moderate Divines* (1670).

2 Epistemology: certainty, 'moral certainty' and miracles

In a series of works and sermons John Tillotson, Edward Stillingfleet and John Wilkins refined and extended the arguments about knowledge made by Chillingworth earlier in the century. 'Absolute' infallibility was declared possible only for God. For Tillotson, however, a kind of 'conditional' infallibility was possible for humans. Immediate sense perception gave the highest assurance attainable by man alone. A similarly high level of certainty attached to demonstration, most notably possible in the field of mathematics. For demonstration, the denial of the conclusion necessarily involved a contradiction. Wilkins similarly described conditional 'infallible certainty' as associated both with the physical certainty derived from sense-data, the 'highest kind of Evidence, of which humane nature is capable' and with the mathematical certainty of matters of self-evidence, basic principles of logic, and deductions from these principles (Shapiro 1983: 85).

In most matters of religion, however, only the 'moral certainty' of belief and no higher level of certainty was possible. It was none the less sufficient. For Tillotson, such belief excluded 'reasonable cause' for a 'considerate Man' to doubt, but not 'all possibility of Mistake'. It thus involved a probability sufficiently high to call for 'a firm and undoubted assent' on grounds 'fit fully to satisfy a prudent man' (Van Leeusen 1970: 37). As Wilkins put it, there was an 'indubitable certainty' the objects of which did not compel assent but which were so plain, 'that every man whose judgment is free from prejudice will consent to them' (Shapiro 1983: 85-6). God was declared to be good, and so had created humans in such a way that they assented to evidence properly; only an unreasonable person would require more than the appropriate level of certainty. As Stillingfleet put it, God 'doth not require us to believe any thing without sufficient grounds for our believing it, and those grounds do bear a proportionable evidence to the nature of that assent which he requires' (Carroll 1975: 68).

These arguments were designed to counter those who were too dogmatic and those who were too sceptical. Dogmatists were unreasonable because many beliefs needed a far more careful assessment of testimony and evidence and a far more careful interpretation of the words of Scripture than they produced. Many beliefs could not reach the level of certainty that dogmatists claimed. Human knowledge was limited, and humans were subject to error. Sceptics were unreasonable because they wished for more certainty than was required, focused on 'subtilties', and ended with more doubt than was appropriate. Atheists were particularly unreasonable because they required more evidence for belief in the existence of God than was necessary, and neglected the testimony of the intelligent creation in the 'book of the world'. According to Tillotson, atheists were also unreasonable because, in quasi-Pascalian terms, they were imprudent in ignoring the 'danger' of choosing a few base pleasures when God might exist and if so would punish them exceedingly (see Pascal, B. §6). Tillotson and Wilkins focused on the pursuit of happiness as a motivation to be religious, with man's dominant interest being happiness in the next life. As Wilkins put it, the 'rational and prudent man' should 'order his actions in favour of that way which appears to be most safe and advantageous for his own interest' (Shapiro 1983: 89). Emphasizing the morality taught in Revelation and by natural reason, and the role of God's rewards and punishments to motivate moral performance, the Latitudinarians effectively identified evangelical righteousness with natural righteousness.

For several of the Latitudinarians miracles had been crucial to generating appropriate belief: 'to confirm a Divine Testimony to the World, and to make that appear credible which otherwise would have seemed incredible' (Stillingfleet, cited in Carroll 1975: 68). Belief in such miracles depended on the credibility of their witnesses. Such credibility therefore needed to be assessed carefully in order to yield appropriate moral certainty. Writing many works against Roman Catholicism in his early years, Stillingfleet particularly sought to distinguish true miracles from false wonders, and to repudiate Catholic claims about the continued performance of miracles. He therefore set out a series of criteria to distinguish miracles from frauds: that miracles were wrought to confirm a divine testimony; that miracles did not contradict revelation; that they left divine effects on believers; that they tended to overthrow the devil's power; that the circumstances and manner of operation of the true differed from the false; and that they evidently exceeded created power. For Stillingfleet, once Christianity was established, further miracles were unnecessary. Catholic claims were therefore false (see Miracles).

The arguments of Tillotson, Stillingfleet and Wilkins on proportioning assent to the evidence, the limitations of knowledge, the dependence of men upon appearances and the rejection as 'unreasonable' of scepticism, atheism, and dogmatism in favour of a reliance on 'moral certainty' were paralleled and extended in the fields of scientific enquiry and defences of natural religion in many other works by Latitudinarians and their associates, including Joseph Glanvill's *Vanity of Dogmatizing* (1661) and *Essays on Several Important Subjects in Philosophy and Religion* (1676), and many of the scientific works of Robert Boyle (see Glanvill, J.; Boyle, R.).

3 Locke and Latitudinarianism

Locke knew several Latitudinarians well, especially Tillotson and Fowler, and he indicated support for 'latitudinism' in his *Essay on Toleration*. The *Essay Concerning Human Understanding* (1689) presented a generalized philosophic statement significantly influenced by many elements of the Latitudinarians' account of the limitations of the human mind and proportioning of assent. Many of Locke's emphases on moralism, on God's rewards and punishments, and on the limited number of fundamentals of Christianity, were shared with the Latitudinarians. However, Locke restricted the term 'certainty' to that which is known to be true, and refused to apply it to that which was probable or 'morally certain'. Moreover, he argued that the idea of substance could not

come from sensation or reflection, and made the idea of substance an idea of ‘I know not what’, effectively undercutting some of the Latitudinarians’ attempts in the 1690s to defend the Trinity against the claims of deists and unitarians that the application of reason to religion supported their own more radical rejections of the Trinity or of Christianity itself (see Deism). In reply to Locke, Stillingfleet utilized scholastic metaphysics in defence of the mysteries of religion, holding that substance was a ‘rational idea’ emanating from the soul itself. Other Latitudinarians, such as Tillotson, in general preferred to stress that the Trinity was to be believed as ‘above’ but not contrary to reason; Tillotson defended the Trinity in the 1690s. For their emphases on reason, morality and toleration, the Latitudinarians were often accused of Socinianism; Locke was closer to it (see Socinianism).

Lavrov, Pëtr Lavrovich (1823-1900)

*Pëtr Lavrov was one of the main theorists of Russian populism (*narodnichestvo*) - a trend of thought and a movement which crystallized after the abolition of serfdom in Russia in 1861.*

There were many different currents within this broad trend but all of them concentrated on the possibility and desirability of securing a non-capitalist way of development for Russia. This was so because the populists, having perceived (often with the help of Marx's Capital) the contradictions of capitalist development, lost their confidence in 'European' progress, recognized in capitalism only a regression and chose therefore an adamantly anti-capitalist stand, combined, as a rule, with backward-looking idealization of the peasant commune.

The dominant Western theories of social evolution - from Spencerian liberalism to Marxism - strongly emphasized the 'objective' character of the laws of social development and defined capitalism as a necessary phase of progress. Russian populist socialists deeply felt that in Russia's backward condition such theories offered a convenient tool for apologists of capitalist progress, who sanctioned and justified the suffering of the masses by referring to the 'objective laws of history' or 'the iron laws of political economy'. This led them to a demonstrative rejection of the 'objectivist' conception of progress. Lavrov was the first populist theorist who set against 'objectivism' a conscious and systematic vindication of 'subjectivism'. He was supported in this by another populist thinker, Nikolai Mikhailovskii. The common features of their views have been labelled 'subjective sociology' or the 'subjective method'.

1 Anthropologism

Pëtr Lavrovich Lavrov, the son of a wealthy Russian landowner, embarked in his youth on a military career. By 1858 he had already attained the rank of colonel. He was also interested in philosophy and sociology, and in 1860 published his first book, *Ocherki voprosov prakticheskoi filosofii (Sketches in the Domain of Practical Philosophy)*, in which he defined his position as 'anthropologism'. In 1862 he became a member of the underground revolutionary organization Land and Freedom. In 1866 he was arrested and sentenced to exile in Vologda province. In February 1870 he managed to flee abroad, made contacts with the International Workingmen's Association and, in the next year, took part in the Paris Commune. From 1873 to 1876 he published, in Zurich and in London, an influential revolutionary periodical *Vperëd (Forward)*.

Lavrov's initial philosophical position, as presented in *Ocherki voprosov prakticheskoi filosofii* and in his lectures 'On the Contemporary Significance of Philosophy' (1860), was directly connected with the antitheological and anti-Hegelian anthropologism of Ludwig Feuerbach: it was conceived as the radical overcoming of speculative idealism, which reduced individuals to mere tools of Absolute Spirit, and as a philosophical vindication of really existing human beings, creatures of flesh and blood. The human person as an indivisible physical-psychological individual was for Lavrov the only indisputable datum and the necessary starting-point for a scientific philosophy. This entailed commitment to a sort of anthropocentric scientism and anthropological relativism. Philosophical questions were interpreted as pertaining ultimately to man, to the human experience, while 'things-in-themselves' were excluded from the sphere of legitimate scientific knowledge. The relativistic component, inherent in this view, effectively undermined metaphysics but did not apply to ethics. Lavrov saw man as an ethical being and, following Kant, argued for the possibility of non-relative judgments in the sphere of 'practical reason'.

Lavrov took care to distinguish his position from positivistic scientism, based on the natural sciences. In the essay 'Zadachi positivisma i ikh reshenie' (The Tasks of Positivism and their Solution) (1868) he discussed different variants of positivist thought, recognized the centrality of positivism in contemporary intellectual life and fully endorsed the positivist commitment to strictly scientific methods. At the same time he criticized the one-sided 'objectivism' of contemporary positivism, setting against it the positivism of Auguste Comte, which recognized the legitimacy of the 'subjective method'. His conclusion was that positivism proved incapable of solving its own problems because it lacked a unifying philosophical principle. This principle was man as a feeling and thinking being, a symbol of the true unity of mind and body. Thus, the historical role of positivism was only to pose problems - their solution would be provided by an anthropological philosophy whose germ could be found in Feuerbach, Proudhon and J.S. Mill.

2 'Subjective method' and theory of history

Lavrov's preoccupation with legitimizing the 'subjective method' reached a new level in his *Istoricheskie pis'ma (Historical Letters)* (first published, under the pseudonym 'Mirtov', in a Russian periodical, in 1868-9). This short book gained him immense popularity among young radicals, tormented by feelings of social guilt and eager to sacrifice their personal interests for the good of the masses.

Historical Letters owed this enormous success mainly to one chapter, 'The Price of Progress'. The possibility of talking about progress, argued Lavrov, has been dearly bought by the human race. The personal development of some members of the privileged classes has been purchased with the labour and suffering of many generations of heavily exploited people. The 'conscious minority' should never forget its debt and should make every effort to discharge it.

Lavrov's conviction that the 'debt to the people' must be paid off now was incompatible with the theory of progress as an objective and inevitable law of development. The 'objectivist' conception of progress had to be replaced by a 'subjectivist', ethical conception, based upon 'subjective sociology'.

The basic assumptions of Lavrov's 'subjectivism' can be embraced in three points. First, it was a defence of ethicism, a standpoint derived from a strong conviction that values are independent of facts, that moral evil cannot be 'scientifically' explained away, and that moral protest against suffering is valuable and obligatory irrespective of any 'objective' condition. Second, it was an epistemological and methodological position, which denied or disputed the possibility of 'objective' methods in the social sciences: it claimed that historical and sociological knowledge can never be value-free because it always depends upon the unconscious emotions or (much better) on the consciously chosen ideals of scholars. Third, it was a philosophy of history which maintained that the 'subjective factor' - human thought and will - can effectively oppose the spontaneous tendencies of development and play a decisive part in historical process. Lavrov based upon it his 'practical philosophy' which proclaimed that 'critically thinking individuals', having united in a party, could become a social force and change the existing state of affairs in the direction indicated by their 'subjective' aims.

In its application to methodological problems Lavrov's 'subjectivism' yielded an interesting epistemology of history, anticipating, to a certain extent, the revolt against positivism in the humanities. The so-called 'laws of history', he claimed, do not exist; historical events are always unique and unrepeatable. Historians cannot limit their task to the description of facts, since 'facts' are not something given; they have to be selected and endowed with meaning, which presupposes a creative activity on the part of the knower. In looking at history, therefore, the main problem is one of selection, of finding a criterion that will make it possible to pick out 'what is important and meaningful' from the amorphous mass of historical data. Such a criterion must be subjective because it depends on the social ideal adopted by a particular scholar. All facts are classified and all historical events interpreted according to how they relate to this ideal. Progress is a category required to impose order on the raw material of history. In itself, history has no meaning: there are many meanings to be found in it, but all of them are imparted to it by human individuals. Imposing a meaning on history presupposes an ideal not only in the sphere of historical understanding but also in the sphere of historical action. Human history begins therefore with the emergence of critically thinking individuals trying to shape society by means of 'criticism' and 'idealization'.

Lavrov formulated his own ideal as follows: 'The physical, intellectual, and moral development of the individual; the incorporation of truth and justice in social institutions'. Progressive approximation to this ideal was defined by him as a process that is being accomplished by means of the critical thought of individuals who aim at the transformation of their culture. By 'culture' Lavrov meant a static social structure based on religion, tradition and folk ways; by 'civilization' he meant a dynamic social structure in which religion was replaced by science, and custom by law. These two concepts were further developed in his sociological theory.

3 Sociological conceptions

With the decline of revolutionary populism in the 1880s Lavrov returned to scholarly work and produced several books in the field of historical sociology, such as *Opyt istorii mysli novogo vremeni (Essay on the History of Modern Thought)* (1888-94), *Zadachi ponimaniia istorii (Problems in the Interpretation of History)* (1898), and the posthumously published *Vazhneishie momenty istorii mysli (Stages of Great Importance in the History of*

Thought) (1903). All these works reflect an influence of positivist evolutionism and thus appear to make considerable concessions to ‘objectivism’. On closer examination, however, it turns out that it was only a change in emphasis. In *Historical Letters* Lavrov made a distinction between history, which deals with what is unique, and sociology, which aims at discovering certain overall laws of development. Later, in an article, ’O metode v sotsiologii’ (On Method in Sociology), he clearly stated that in sociology, in contrast to history, both methods - the subjective and the objective - were justified and applicable. Recognizing the legitimacy of the ’objectivist’ approach did not change this view that conscious, subjectively motivated actions were axiologically infinitely superior to ’natural’ processes, assuming the form of ’objective laws’.

Lavrov defined sociology as a science dealing with the forms of social solidarity, which he divided into three main types. The first was the unconscious solidarity of custom; the second was a purely emotional solidarity, based on impulses not controlled by critical reflection; the third was ’conscious historical solidarity’ resulting from a common effort to attain a consciously selected and rationally justified goal. This third type represented the highest and most important form of human solidarity. It evolved later than the first two types and heralded the process of the transformation of static ‘culture’ into dynamic ‘civilization’.

In his conception of the motive force of history Lavrov consciously avoided reductionism. Social evolution, he thought, was stimulated by the individual’s diverse needs. Among biological needs the most important was the need for food, which stimulated economic development. But apart from biological needs, characterizing humanity as an animal species, there were also specifically historical needs, constituting the historical dimension of human existence. The most important of these was the disinterested ‘need for development’ typical of ‘critically thinking individuals’. Lavrov believed that this need was becoming more and more important.

Lavrov’s overall conception of social evolution was tied to the Saint-Simonian and Comtian notion of history as a succession of ‘organic’ and ’critical’ phases. Historical progress moved along a spiral in an accelerating rhythm - its successive stages were growing shorter, and the difference between organic and critical periods was constantly diminishing. This was because historical evolution offered growing opportunities to achieve a harmonious fusion of solidarity and development, order and progress.

Regardless of their scholarly value, Lavrov’s sociological conceptions are of great interest as a historical document. They reveal Lavrov as an ideologist of the intelligentsia, the author of an extremely influential and truly classical conception of the intelligentsia’s historical mission. Some scholars have suggested that his writings were an expression of a specific ’intellectual aristocratism’, or even of certain characteristic aspects of the gentry mentality (the view of the masses as an inert herd, combined with a sense of guilt). Such views were being formulated even within the populist movement; their most extreme exponent was Pëtr Tkachëv (1844-86), a ’Jacobin’ populist, who accused Lavrov of betraying egalitarianism and paving the way for the transformation of the intelligentsia into a new ruling class. In fact, however, Lavrov consciously distanced himself from the theories of intelligentsia as a ’new class’, such as the Comtian theory of an intellectual elite that would govern the hierarchically stratified society of the future. For him the intelligentsia was first and foremost the *moral* elite, the conscience of society, not an aristocracy of intellect; intellectually bright and educated people who were selfishly indifferent to the fate of the suffering masses were defined by him as ’cultural savages’, not members of the intelligentsia. He was therefore a leading theorist and spokesman of the intelligentsia as an ethical category, that is, in the nineteenth-century Russian meaning of the term.

Law and morality

Within the tradition of natural law thinking which finds its roots in the philosophies of Aristotle and Aquinas, the political community has generally been understood in terms of a fundamental goal: that of fostering the ethical good of citizens. Law, on this conception, should seek to inculcate habits of good conduct, and should support a social environment which will encourage citizens to pursue worthy goals, and to lead valuable lives. Pragmatic considerations may sometimes suggest the wisdom of restraint in the pursuit of these goals, and citizens may therefore, on appropriate occasions, be left free to indulge depraved tastes or otherwise fall short of acceptable standards. Such pragmatic arguments for the freedom to engage in vice, however, do not call into question the legitimacy of the state's concern with individual morality.

By contrast the liberal tradition has tended to place constraints of principle upon the scope and aims of the law. The most influential such attempt was J.S. Mill's advocacy of 'the harm principle': that the law may forbid only such behaviour as is liable to cause harm to persons other than the agent. Many difficulties surround this and other, more recent, attempts to formulate and defend constraining principles. For instance, should one take into account only the immediate effects of behaviour, or more remote and diffuse effects as well? Thus it is argued that immoral behaviour which in the short term 'harms nobody' may, in the long run, lead to a decline in morality in society at large and thereby to diffuse harmful effects.

1 Two traditions

The attempt to delimit principles which confine and constrain the proper scope of legal and governmental interference is inseparable from the liberal tradition: one need only think of Locke's attempt to define such a sphere of legitimacy by reference to a body of natural rights. Yet the attempt to delineate such principles has not always focused in a clear and circumscribed way upon the particular problem of an allegedly private sphere of morality. Thus when Locke, in his *Letter Concerning Toleration* (1689), seeks to defend religious toleration, he seems to do so not by reliance on his theory of natural rights and social contract, but by means of a pragmatic argument which would have sat comfortably within the assumptions of the Thomist natural law tradition: intolerance is, for Locke, pointlessly ineffectual rather than a violation of a distinct constraining political principle (see Locke, J. §1). Debate began to focus clearly on the idea of constraining principles precluding the state from interference with private immorality only in consequence of essays such as Wilhelm von Humboldt's *The Sphere and Duties of Government* (published posthumously in 1852) and J.S. Mill's *On Liberty* (1859) (see §2 below). The latter work has exerted the most fundamental influence in English-speaking countries.

Before we examine Mill's claims, however, it is worth making a couple of preliminary points. In particular, we should reflect upon the diverse motivations which may underpin rejection of the Aristotelian tradition of political thought, and may lead to the search for principles constraining the community's entitlement to enforce 'private' moral standards. It is often thought that the liberal is committed to a 'subjectivist' or noncognitivist understanding of moral judgment, and that the liberal concern for tolerance is simply a consequence of such subjectivism (see Moral judgment §1). Such an interpretation must, however, be a mistake: for, if moral judgments are simply expressions of subjective emotion or attitude, this must apply to moral judgments about the importance of tolerance along with all other moral judgments. A better reading of liberalism would see it as flowing from the inability to reach *agreement* on moral questions, rather than from the supposedly 'subjective' character of moral judgments. This reading does not succumb to the self-subverting character of an appeal to subjectivism, but it does have its problems. In some versions, for example, it can seem to imply that the need for consensus among those who disagree is the rationale for restricting the state's role; but this seems to make the argument for tolerance dependent upon the existence of a balance of power between contending factions.

Finally, one popular line of defence claims that liberalism is reliant neither upon moral subjectivism nor upon the inconclusive nature of moral argument, but upon the value of autonomous choice: it is good that people choose their own projects and lifestyles, even when they choose degrading or unworthy options (see Autonomy, ethical). The problem posed by this approach is that it is not wholly clear that the approach can be contrasted in any very fruitful way with the concerns of the Aristotelian tradition. After all, the Aristotelian might claim that *being freely chosen* is an essential condition of a good life, so that the state's concern to encourage good lives itself dictates a

concern to protect autonomy. Viewed from this perspective, the debate with liberalism would seem to be a pragmatic argument within the parameters of the Aristotelian tradition.

Such a reconceptualization of the terrain might well be viewed as damaging by many liberals. For many of the critics of Mill and of more recent liberals have directed their fire at the very idea of abstract principles constraining legitimate interference with a realm of supposedly ‘private’ conduct. They have been less concerned to oppose the concrete applications of these principles advocated by the liberals themselves. A characteristic example is James Fitzjames Stephen, who, in his book *Liberty, Equality, Fraternity*, wrote as follows:

> I object rather to Mr. Mill’s theory than to his practical conclusions…. The objection which I make to most of his statements on the subject is, that in order to justify in practice what might be justified on narrow and special grounds, he lays down a theory incorrect in itself and tending to confirm views which might become practically mischievous.

2 Mill’s ‘harm principle’

Mill proposes what he describes as a ‘very simple principle’ as being ‘entitled to govern absolutely the dealings of society with the individual in the way of compulsion and control’. The principle asserted that ‘The only purpose for which power can rightfully be exercised over any member of a civilised community, against his will, is to prevent harm to others’ ([1859] 1956: 13).

Mill’s ’harm principle’ has sometimes been taken to suggest an atomistic view of society such that there is an area of private conduct which does not impinge on others at all, and which falls outside the law’s proper domain for that reason. As his critics were quick to point out, only the most trivial actions are devoid of effects upon others. In spite of the encouragement that Mill gives to this interpretation in some of his language, however, he explicitly conceded that ‘self-regarding’ actions may nevertheless affect other people. His principle is not intended to demarcate an area of conduct that is beyond the law’s remit, so much as a type of reason to which the community should restrict itself: in considering whether an action should be prohibited, only *some* of the effects of an action should be taken into account. In particular, the action’s effects in ‘harming’ others may be taken account of, while the effects upon the actor himself must be disregarded, as must the disapproval of unaffected third parties who consider the act immoral (see Paternalism §2).

In other ways, however, the suggestion that Mill adopts an unduly ‘atomistic’ view might seem to have some validity. For, if the harm principle is construed as prescribing a focus on fairly immediate and individuated harms, it may lead us to neglect the importance of sustaining social institutions that may be undermined in more oblique ways by the law’s failure to uphold conventional moral standards. One reply to this line of attack might be that nothing in the harm principle compels such a narrowly individuated focus: if the erosion of some social institution *is* a probable consequence of liberalization in an area of conduct, and if that erosion would be harmful, the harm principle legitimates our taking such considerations into account. The reply is problematic, however, in so far as a harm principle which invites us to take account of quite remote and diffuse effects threatens to prove empty and insubstantial in application. Mill himself is quite ready to accept that highly diffuse effects upon others can constitute ‘harm’ (he is, for example, critical on this ground of the unrestricted right to procreate) but the concession does represent an erosion of the integrity of the principle.

A number of other serious problems are associated with the harm principle. One question concerns the compatibility of the principle with Mill’s commitment to utilitarianism (see Utilitarianism). For should not a utilitarian legislator take account of *all* of the effects of an action, before deciding upon its prohibition? If some people suffer deep unhappiness at the very thought of acts of which they disapprove being performed in private, how can this unhappiness be justifiably *ignored* from the viewpoint of utility? It has been suggested that a utilitarian legislator should disregard such unhappiness in so far as it flows from the adoption of nonutilitarian moral views. But even if this argument could be sustained, it would not go far enough: I may be upset by the thought of acts which I consider simply disgusting rather than immoral; and, in any case, the exclusion of harm to the actor himself remains unexplained by this approach.

It is likely that Mill saw the harm principle as an intermediate maxim, by which utilitarians should regulate their

conduct, with the ultimate objective of advancing overall happiness in the long run. Such a view avoids inconsistency, however, only at the price of rendering the entire case dependent on largely empirical claims about the long-term effects of individual liberty. Mill's defence of the harm principle could in this way be thought to manifest an undue and ungrounded optimism. Given the aggregative conception of the common good espoused by utilitarianism, it would be remarkably fortunate if the best way of advancing the collective welfare was invariably to protect individual freedoms.

Quite apart from the compatibility or otherwise of the harm principle with Mill's utilitarianism, however, is the question of the meaning of 'harm' itself. For it has been repeatedly and justifiably pointed out that the question of what constitutes harm is an evaluative question which cannot in the end be separated from our wider ethical beliefs. Attempts, such as that of Joel Feinberg (1984), to analyse harm in terms of setbacks to interests simply reformulate the problem as one concerning the nature and content of our interests. Yet, without some morally neutral account of harm, Mill's principle seems to do little to exclude criminal prohibitions which are simply based upon moral disapproval of the actor's conduct. Consider, for example, the harm principle in its application to the debate about pornography. One issue concerns the suggestion that pornography fosters a social environment within which violent crimes against women are more likely: this argument appeals to an uncontroversial instance of harm, but makes the issue depend upon highly contestable empirical theses about the effects of pornography. What then if someone suggests that women are harmed *intrinsically* by pornography, in the sense that all women are harmed when some women are depicted as being objects available for sexual gratification? This suggestion employs a notion of harm which might not be universally accepted, but it challenges us to articulate criteria for what is to be regarded as harm (see Pornography).

A relevant suggestion has been made (in a slightly different context) by Brian Barry. He suggests (1995) that 'harm' might be defined in terms of what the great majority of people, having divergent conceptions of the good, would nevertheless agree upon as 'bad'. The suggestion builds upon the sound insight that people may have divergent ethical conceptions which nevertheless have an extensive area of overlap; but in requiring something short of complete universality and unanimity, Barry's approach seems in danger of making the scope of the harm principle itself depend upon majoritarian politics of a kind that Mill was concerned to constrain.

The above arguments may or may not be fatal to Mill's position. They do not render the harm principle wholly vacuous, because that principle serves, at a minimum, to direct our attention to an action's effects on others, rather than on the actor himself; but, if sound, the arguments dramatically reduce the value of the principle as a limitation upon the proper scope of the state's coercive power.

Even the requirement that we should have regard only to effects upon others may be a less substantial constraint than it seems, for we must remember Mill's acceptance of diffuse effects as 'harm'. Acts which are widely considered to be immoral may, in the first instance, affect only the actor himself; but, by creating a communal environment in which such acts are tolerated, they may make it harder (for example) to educate children into moral standards of conduct. When combined with the impossibility of offering a morally neutral account of the nature of 'harm', such diffuse effects seem to reduce the significance of Mill's principle to vanishing point.

3 The Hart/Devlin debate

A concern for such diffuse effects of immoral conduct lies at the bottom of an argument presented by Lord Devlin in 1959, in a British Academy Maccabean Lecture in Jurisprudence. Lord Devlin was then a judge of the Queen's Bench Division of the High Court, becoming a Lord of Appeal in 1961. His Maccabean Lecture arose out of the Wolfenden Report on Homosexual Offences and Prostitution, which had been published in 1957, and which had articulated the principle that 'private immorality' should not be the concern of the criminal law. Devlin criticized this approach, on the ground that society depends for its survival upon the existence of a shared morality, and that it was therefore in principle possible for grossly immoral conduct to threaten the survival of the society. Consequently, society has a right to enforce its shared morality as a measure of self-protection. Devlin was concerned, not with the truth or falsehood of the relevant moral views, but solely with the fact that they were widely shared and fundamental to the society's stability (Devlin (1965).

H.L.A. Hart responded to Devlin's assault by pointing to the absence of empirical support for Devlin's claims that immorality could lead to social breakdown (Hart 1963). But it has more recently been suggested (George 1993)

that Devlin had in mind not a breakdown in social order so much as a loss of social cohesion, where people relate to each other purely on a basis of self-interest rather than on a basis of moral principle. If this interpretation is correct, it would make Devlin's claim both more plausible and less open to empirical refutation or confirmation.

Devlin acknowledged a debt to the Victorian judge and jurist James Fitzjames Stephen, whose book *Liberty, Equality, Fraternity* 1873) was a forceful attack upon Mill's theory. Stephen's approach was utilitarian in character, but he regarded Mill as having departed from the consistent utilitarianism of Bentham and James Mill. Hart described the works of Stephen and Devlin as revealing 'the outlook characteristic of the English judiciary' (Hart 1963).

4 Dworkin on 'external preferences'

The 'goal-based' approach of utilitarianism is rejected by Ronald Dworkin in favour of what he calls a 'rights-based' approach; but, in reality, there are good grounds for considering his position to be a modified form of utilitarianism, rather than a radical rejection of that approach. Dworkin takes the view that, in so far as utilitarianism possesses any genuine moral appeal, that appeal is a consequence of the extent to which it expresses our belief in a 'right to equal concern and respect'. He argues, however, that the notion of equal concern and respect receives inadequate expression within utilitarianism to the extent that the utilitarian takes account not only of 'personal preferences' (preferences for what I myself do and receive) but also of 'external preferences' (my preferences about what others do or receive). A proper concern for equality would exclude the influence of external preferences by recognizing a 'right to moral independence': the right not to suffer disadvantage simply on the ground that others consider one's conceptions of a good life to be ignoble or wrong (Dworkin 1985).

Dworkin believes that rights are best understood as 'trumps' over collective goals, and that, consequently, their philosophical justification is in part relative to the goals which have been adopted. The problem with taking account of external preferences (if a utilitarian goal has been adopted) is that the external preferences 'purport to occupy the same space' as the utilitarian theory itself: utilitarianism must be neutral between pushpin and poetry, but it cannot be neutral between itself and Nazism (for example) (Dworkin 1985: 363).

Dworkin insists that this argument holds even when the external preferences are not based on any general moral or political theory: they still 'invade the space claimed by neutral utilitarianism'. It is difficult to see how this argument can be sustained, however. One cannot argue, for example, that a preference 'invades the space of utilitarianism' simply because, if fully satisfied, it would necessitate a distribution not recommended by utilitarianism. Such an approach would prescribe a decision procedure which was viciously circular: for one would have to decide upon the requirements of utility before one could say whether any particular preference should be taken into account in calculating those requirements.

In any case, could it not be said that Dworkin's approach fails to show equal concern for those whose wellbeing or utility is a function of their external preferences? Suppose that my sole concern is your welfare, and my life will be a failure if your happiness is not secure. How can equality of concern dictate that my wellbeing should be disregarded?

Many will consider that the proposed 'right to moral independence' is more attractive than is the justification which Dworkin proposes for it; but then, few if any theorists have argued that people should be disadvantaged simply in consequence of a widely held disapproval of their lifestyles, so perhaps the 'right' is not very substantial after all.

Law and ritual in Chinese philosophy

The contrast between li, conventionally translated as 'rites' or 'rituals', and fa, conventionally translated as 'law', marks a distinction in Chinese political theory as to the nature of political order and the preferred means of achieving such order. Lizhi, traditionally associated with Confucianism, refers to political order predicated on and achieved primarily by reference to the li or 'rites', that is, traditional customs, mores and norms. In contrast, fazhi, associated with Legalism, refers to political order attained primarily through reliance on fa or 'laws', that is, publicly promulgated, codified standards of general applicability backed up by the coercive power of the state.

The tension between these two dominant strategies for achieving social and political order - lizhi and fazhi - is a theme that began in the classical tradition and has persisted down to the present day, even though the understanding of li and fa and the relation between them has changed and evolved over the years. For example, some thinkers saw li as context-specific, flexible norms or standards of a particular culture. Others saw li as more permanent, general standards. Some objected to the codification of li and fa; others favoured it. Some saw li and fa as interdependent, equally important and mutually reinforcing; others relied predominantly on one to the detriment, if not total exclusion, of the other.

Accordingly, it is not possible to speak of a single conception of li (lizhi) or fa (fazhi). Nevertheless, one must extract or highlight certain general or dominant features that tend to characterize lizhi and fazhi and to distinguish the one from the other, if one is to make use of this important contrast as a hermeneutical tool for interpreting, explaining and understanding a central debate in Chinese political philosophy. In reflecting on the importance of the lizhi versus fazhi distinction, five salient points emerge.

First, advocates of lizhi have tended to favour less formal means of conflict resolution than advocates of fazhi. The former believe that informal methods foster more particularized justice; the latter believe such methods provide excessive discretionary authority to those in power and thus foster abuse. Accordingly, publicly promulgated rules or laws are necessary.

Second, and a corollary to the first, fa or 'laws' are more formal norms of greater general applicability than the li, which in most instances consist of the web of informal context- and culture-specific rules that provide guidance for appropriate civil interaction in daily life among the various members of a certain community. Fazhi, therefore, is more of an externally imposed order that requires of the individual compliance more than participation. In contrast, lizhi proponents view order as emerging out of a particular context, a particular community of people. Society is what those who comprise it choose and make it to be. Participation rather than mere compliance is central.

Third, and again a corollary, lizhi and fazhi mark a contrast in the goals and aspirations of society. Advocates of lizhi tend to be more optimistic about human kind and the possibility of achieving a harmonious social order in which each person is able to find their place and play their chosen role. They tend to see society, social order, humanity, as an achievement. If human beings are willing to put aside narrowly selfish and provincial concerns, if they are willing to defer to the excellence of others and to cooperate in the project of creating a harmonious social order in which each has a place, then such an order is possible. In the process, one becomes a better person. Put differently, one's potential for individual and personal growth is inextricably bound up with the fate of society.

In contrast, many of the fazhi persuasion take a dimmer view of human nature. Humans are by and large self-interested beings. Left to their own devices, the strong will exploit the weak; the powerful will abuse the powerless. Impartial rules are necessary to limit what one person can do to another. Laws provide this minimum layer of protection, this floor below which society cannot sink and remain a peaceful, and arguably just, society. Of course law may play a more positive role as well; recourse to general laws may simply be an efficient way to ensure an equitable distribution of social resources, for example. At the end of the day, however, advocates of fazhi have been primarily concerned with the use of fa as a corrective to the abuses and weaknesses of li. Thus law's role in ensuring a minimal floor of protection, a base equality, has been underscored, explaining in part the rather negative image of law in China through the ages. In contrast, the positive side of law, the empowering aspect of rights, the ability to use law as a vehicle for social change, has been central to many Westerners' conception of law.

Fourth, as might perhaps be expected, there has been no clear victor in the lizhi *versus* fazhi *controversy. No system is perfect; no one has yet achieved the perfect means for realizing social order. Many of the same issues confront every society: how to achieve fairness and justice for all while at the same time recognizing the uniqueness of each person and each situation, and thereby achieve justice for each; how to provide those in power the necessary discretionary authority to mete out a particularized justice without falling prey to personal prejudice, bias, corruption and abuse; how to ensure that individuals have sufficient rights to shield themselves against each other and the state, and yet simultaneously encourage people not to wield those rights as weapons in endless litigation aimed at maximizing one's own personal interests to the detriment of society's interests; how to ensure that law will be a tool of the disempowered to effect social change and not simply a tool for exploitation and legitimation by those in power; how to implement a formal rule of law with institutional integrity and independence, overseen by professionals, and yet prevent the institution from becoming overly bureaucratic and law the esoteric province of the professional lawyer. The* li *versus* fa *distinction, although not a perfect fit, is useful as a way to organize Chinese thinking on, and approaches to, these and similar issues.*

A fifth and final introductory point is that both lizhi *and* fazhi*, as they have developed in China, have failed in two important respects. First, they have failed to provide effective restraints on the power of the ruler, especially institutional restraints. Second, they have failed to adequately address the need to protect the individual against the state. Again, this failure is largely institutional, although like the failure to adequately restrain the power of the ruler, it can also be traced back to certain underlying philosophical assumptions common to both the* lizhi *and* fazhi *traditions. These assumptions include the rejection of three key assumptions of the western liberal tradition: (1) that someone to treat someone with respect and as one's equal requires that one refrain from imposing one's view on them (the normative equality premise); (2) that each person knows what is best for themselves and/or people reasonably disagree about what constitutes the good (the epistemic equality premise); and (3) that the interests of the individual and state may not be, and arguably are not, reconcilable.*

1 Context

Chinese philosophical thinking has always been elitist. Few Chinese thinkers would accept the liberal assumption (the epistemic equality premise) that no person or group possesses superior moral insight. From the pre-historical mythical ancestors of China, Yao and Shun, to the Confucian sage-rulers of the Warring States period, to Mao Zedong and Deng Xiaoping in the twentieth century, Chinese leaders have been credited with an uncanny ability to fathom what is in the best interests of society and its individual members. Indeed, much of their authority to rule is predicated on their claim to special ethical insight and unique political knowledge of the way of rulership.

The rejection of the epistemic equality premise calls into question the normative equality premise (for liberals, the latter also follows as the conclusion of the former): in other words, that to treat someone with respect is to refrain from imposing one's normative views on them. In China, the government has pursued a substantive moral agenda defined in large part by the particular normative vision of the ruler. Chinese governments have been and continue to be paternalistic (much to the dismay of Americans who find, for example, Singapore's public flogging of juvenile delinquents and prohibitions on chewing gum objectionable). The image of the father dominates the political rhetoric of China. To be sure, the specifics of the image vary by school. The Confucian (*lizhi*) father-ruler is kind and compassionate and more of a facilitator of order than a dictator, whereas the Legalist father-ruler (*fazhi*) is the tough disciplinarian who well understands that to spare the rod is to spoil the child. Nevertheless, the image remains the same: the father, knowing what is best, takes care of his children.

Paternalism is on the whole antithetical to individual rights (see Paternalism). Not surprisingly, individual rights have not been and are not a prominent feature of the political landscape of China. There are of course many reasons for China's lack of a strong tradition of individual rights - which, we do well to recall, is a singular phenomenon, until this century virtually unique to the Enlightenment and post-Enlightenment West. One of the reasons for the lack of a strong rights tradition in China is the assumption that the interests of the state and the individual can be brought into harmony, an assumption particularly prevalent among *lizhi* thinkers but also present in many *fazhi* proponents. Given this assumption, it is suggested there is no need for rights to protect the individual against the state.

Ironically, even among contemporary Chinese rights advocates, few have taken note of, much less celebrated, the anti-majoritarian role of rights as 'trumps' on the collective good and the interests of society as a whole. Indeed, it

is not at all clear that even the most ardent Chinese rights advocates would agree with Ronald Dworkin that individual rights trump the overall social good or with John Rawls that ‘each person possesses an inviolability founded on justice that even the welfare of society as a whole cannot override.’ In fact, it is not at all clear that Chinese rights thinkers conceive of rights as anything other than a kind of interest, to be weighed against other interests, including the interests of the majority, the collective, society and the nation. In contrast, most Western rights proponents conceive of rights as moral ends in themselves, deontic in character, and thus different in kind from interests, which are consequentialist or utilitarian in character (see Rights). The difference between rights understood instrumentally as interests versus rights as trumps, moral principles or ends in themselves is not only theoretically fundamental but of utmost practical importance. Translating rights into the language of interests generally has the effect of decreasing the likelihood that rights will be taken seriously. When weighed against the interests of society as a whole, or against the state, the interests of society and the state will usually prevail. This is probably all the more likely in China, given the historical tendency to privilege the interests of the group and the state over the interests of the individual when those interests conflict.

The *li* and *fa* systems as developed to date in China have yet to adequately address the twin issues of restraints on the ruler and individual rights (which set restraints on the state and the majority *vis-à-vis* the individual). Arguably, *fazhi*, with its emphasis on impartial laws of general applicability, provides a more likely source for both effective restraints on the those in power and effective individual rights. Thus it is not surprising that one increasingly sees raised the banner of *fazhi*, which increasingly represents a rule of law along Western lines, with an institutionally independent and professionalized judiciary assigned the role of checking the legislative and executive branches and safeguarding individual rights. Nevertheless, the weight of the past continues to be felt. It is important therefore to understand the *li-fa* debate, and to understand the *li-fa* debate, one must return to the source.

2 Confucius’ classical conception of *lizhi*

The *locus classicus* for *lizhi* is the *Analects* of Confucius:

> Lead the people with government regulations and organize them with penal law (*xing*), and they will avoid punishments but will be without shame. Lead them with virtue and organize them through the *li*, and the people will have a sense of shame and moreover will become humane people of good character.
>
> (*Analects*)

Confucius maintained that to rely solely or even predominantly on law to achieve social order was folly. Laws, backed up by punishments, may induce compliance in the external behaviour of individuals, but they are powerless to transform the inner character of the members of society.

Confucius’ goal was not simply a stable political order in which everyone coexists in relative harmony and isolation, with each afraid to interfere with the other for fear of legal punishment. Rather, Confucius set his sights considerably higher. He sought to achieve a harmonious social order in which each person is able to realize their full potential as a human being through mutually beneficial relations with others.

For Confucius, society is the medium through which one becomes a human being. That is, one becomes a human being, a humane person, by virtue of participation in society. Personhood and humanity are functions of socialization. At birth, before the process of enculturation, of becoming humane, humans are not different from the other beasts. If one does not or is not willing to participate in society and enter into harmonious relations with others, one remains at the level of a beast; one is human *qua* member of a biological species. By turning their back on society, the bestial person (literally *xiaoren*, ‘small person’) fails to utilize the cognitive, aesthetic and spiritual powers which distinguish humans from other species. It is just the engagement of these capacities in joining with others to shape a new world, to create a significantly different and better society and to overcome one’s natural conditions in achieving innovative resolutions to conflicts, that is distinctive about humans. If one cannot overcome the passions, instincts and desires that one shares with other beasts, if one wars against all and resorts to violence and brute strength to fulfil one’s narcissistic wants, then one fails to become truly human, to achieve humanity.

Of course there will always be those who turn their back on society, who refuse to participate in creating a harmonious order and insist on pursuing their narrow self-interest in any manner possible. For such people, law

and punishments are necessary. Confucius, ever practical, did not advocate the complete abandonment of laws. Nevertheless, the goal is to foster an environment in which laws need to be imposed as little as possible: 'In hearing litigation I am much the same as anyone. If you insist on a difference, it is perhaps that I try to get the parties not to resort to litigation.' For Confucius, the ethical and political challenge is to inspire in the many members of society the desire to achieve a humane society and to encourage them to direct their energies toward the attainment of a harmonious social order. What is being required is a willingness to participate in collective living, to search for a cooperative solution, to become humane (*ren*) (see Confucian philosophy, Chinese §5).

For Confucius, the codification and public dissemination of laws sends the wrong kind of message. Laws are designed to protect the minimum interests of the members of society and to provide a mechanism for dealing with and removing those individuals who are not only unwilling to participate in fostering a harmonious social order, but whose behaviour threatens the well-being of others and the ability of society to function. Making the laws public focuses attention, not on the achievement of the highest quality of social harmony possible, but on the lowest level of participation required by society. Consequently, it may encourage some persons to look only to manipulate the system for their own advantage. Thus we find Confucius criticizing the state of Jin for publicly promulgating laws: 'Jin is going to ruin. It has lost its proper rules…. But now when those rules are abandoned and tripods with penal laws on them are cast instead, the people will study the tripods, and not care to honour men of rank.' The proto-Confucian *Shu Xiang* adds:

> In antiquity, the former kings considered the particular circumstances in regulating affairs. They did not make public general laws of punishments and penalties, fearing that this would foster a contentious attitude among the people that could not be stopped or controlled. For this reason, they used their discretionary judgment (*yi*) to keep the people in bounds…and guided them in their behaviour through the rites (*li*)…
>
> (*Shu Xiang*)

Confucius rejects law as a means for attaining social order because law focuses on external compliance. Since one is merely expected to conform one's behaviour to the given legal norm, one is denied the opportunity to fully participate in the creation of a social order more reflective of one's individual character. Laws, as standards of general applicability, do not allow for sufficient individual expression or particularity.

The formal character of a legal proceeding further diminishes the opportunity for a more contextualized justice able to account for the particular circumstances of the individuals involved. By its very nature, a formal legal system elevates procedural justice relative to, if not at the expense of, substantive justice. In fact, one of the motivations for the development of a formal legal system is to provide a procedural means of resolving interpersonal conflicts that cannot be resolved on a more informal, personal level. While substantive justice has always remained the primary goal of the legal system in China, the formal character of the process and the emphasis on predetermined procedures for resolving conflict have often been seen as obstacles to a more personalized and creative approach, to interpersonal conflict.

Confucius' politics of harmony require the voluntary participation of the individuals who collectively comprise society. If conflicts arise, as they inevitably will, each person must evidence a willingness to look for a mutually acceptable solution. Of course a willingness to cooperate is not enough to overcome all conflicts. There must also be sufficient common ground to provide a basis for discussion, understanding and potential mutually agreeable solutions. The *li* provide this essential communally owned repository of shared meaning and value on which to draw in times of conflict. One is inextricably a part of one's tradition. However different one may be from one's neighbour, there are still deep chords of affinity that bind one to other members of one's community. By tapping the areas of commonality, one may be able to find the ground upon which to build a consensus to forge a new harmony. It is the *li* that provide this common foundation for Confucius, and it is in this sense that the *li* are, in the apt description of the contemporary philosopher A.S. Cua, mutual accommodations of differing attitudes, beliefs and values in social intercourse (see Confucian philosophy, Chinese).

The *li* have often been construed as universal ethical principles. As a result, Confucius' *lizhi* has been depicted as a kind of natural law. However, the *li* are better understood as customary norms that gain favour within a particular historical tradition at a particular time and that constitute not unchanging, determinant rules of behaviour but culturally valued, though negotiable, guidelines for achieving harmony in a particular context. There is nothing sacred about the *li* in the manner of the Ten Commandments; the *li* are merely culturally and historically

contingent norms. As such, to depict them as eternal, universal norms is to render them unduly static and determinate.

Although the *li* derive their normative force in part from the fact that they have withstood the test of time and as such represent the amassed wisdom of the ages, they nevertheless must be interpreted in the light of present circumstances to retain their currency and relevance in shaping behaviour. If the *li* are not invested with new meaning and value, reinterpreted in the light of current circumstances, they will degenerate into irrelevant and trivial formal rules of etiquette.

Traditionally, Confucians were members of the *shi* (literati) class, charged with the responsibility of interpreting the *li* and making it applicable to the times. When called upon to resolve conflicts, they attempted to interpret and apply the *li* in such a way as to give effect to a particularized justice that was amenable to all parties and thus restored harmony. Accordingly, they had a vested interest in the *li* and the informal system of mediating conflict that relied heavily on their individual wisdom and judgment. In a system without formal means of appeal, each individual charged with mediation wielded considerable power, a power that could be abused in the absence of the kinds of procedural protections afforded by a formal legal system. On a grander sociopolitical level, the ruler was charged with generating and maintaining social order. Living as he did during the Warring State period, Confucius realized that society was comprised of persons with diverse interests. To bring diverse interests into harmony requires a unifying agent. The ruler was the unifying agent - the Pole Star - responsible for providing the pivotal note.

Yet the Confucian ruler was more of a facilitator of order than a dictator - at least in theory. Using persuasion rather than force, he was to inspire in others a willingness to become humane, to put aside narrow self-interest and form a harmonious society. The ruler was to lead by example. His virtue was to sweep over the people and transform them just as the wind blowing over long stalks of grass bends them as it passes. Ideally, the ruler would not have to impose his way; rather, the people would naturally defer to his example, to his superior moral cultivation. With everyone participating willingly in the collective project of creating a humane society, social order was sure to result. There was no need for the heavy hand of the law. The ruler merely set himself aright, assumed his position at the centre, and let society follow his lead. This was the ideal of the *wuwei* ruler: ‘The Master said: "If there ever was a ruler who could be said to have achieved proper order while refraining from actively imposing his way on others (*wuwei*), it was Shun. What was there for him to do? He simply made himself respectful and took up his position facing due south."’

While the ideal Confucian ruler at least in theory sought not to impose his way, he nevertheless played a pivotal role in setting a course for society, particularly in times of conflict or trouble. It was his ability to perceive creative solutions to the problems facing society that enabled him to lead (see Daoist philosophy §6).

In the end, the Confucian ruler ruled by virtue of his moral vision. His authority to lead was a function of his ability to know the way (*dao*). *Dao* refers to the patterns in the world, the ways in which things are related and the possible ways in which they might be related (see Dao). To ‘know *dao*’ is to perceive these patterns and relations. As a moral achievement, knowing the way requires that one overcome the limited perspective of one’s narrow self-interest to see oneself in relation to others. The more truly cultivated one is, the more relations and possible relations one sees. For Confucius, knowing *dao* also meant understanding tradition and how the past informed and shaped the present. Accordingly, knowledge of the *li* was an essential component of the education of the ruling class.

Confucianism is, as noted above, decidedly elitist and, as a result, paternalistic. In theory, the ruler is the one able to see things other people do not, to see a way (*dao*) to bring harmony out of diversity, to turn disorder into order and to persuade others to join in the realization of that harmonious social order by virtue of his moral vision, character and the example he set. But vision is at bottom personal. As a consequence, political order was (and has remained) largely dependent of the quality of those in power.
